SEVERAL kinds of artificial stone are known to the profession, but owing to their composition or colour have not found much favour among architects. The Owen stone is a material for building which seems to possess all the qualities necessary as a substitute for Portland stone. It is produced by a process, at once simple and economical, from silicious sand and hydraulic lime. These materials, by the agency of pressure assisted by highly-heated water chemically combine to form a compact and homogeneous stone having all the appearance and qualities of Portland stone, but without the flaws, veins, and vents which are found in the natural state. As it can be moulded to any size or shape, or worked by the tool to any design, and in blocks of considerable size, it is obvious that considerable saving will be effected by the use of this artificial stone. The sand used is chiefly quartzose, and is that known as the Bagshot, fine, clean, and sharp, containing, according to one analysis, over 97 per cent. of silica, of iron and alumina oxides 0.92, lime 0.75, and magnesia 0.34. The site on which the manufacture is carried on, near Woking, has a considerable substratum of this fine sand nearly close to the surface, and the examination of the excavation made is sufficient to show its suitability for the purpose. The lime is that known as hydraulic lime from the blue lias, so that the artificial stone is properly described as a silicious aggregate cemented together by an hydraulic cement. The analysts and consulting chemists, Messrs. Stanger and Blount, of Broadway, Westminster, have made a detailed analysis of both Portland stone and the Owen stone, from which it appears the cementing constituents of the latter form 26.73 per cent. of the composition, and from their tests it is stated that the resistance to weathering of the artificial stone is equal to that of Portland, while its resistance to damage by fire and water, as proved by experiment on test blocks, is "considerably greater." The manufacture has been carried on for some time in Scotland and near Woking. Last Tuesday a party of gentlemen went to Worplesdon, near Woking, for the purpose of inspecting the

works now in operation. Mr. Owen, the patentee, explained the construction of the machinery and processes; the pressure cylinders, of which there are six in use; the feeding apparatus and hopper, the latter divided into two parts, by which the sand and hydraulic lime are severally conveyed and mixed in their due proportion, and delivered to the moulds, which are then run by a short trolley into the pressure chambers. Inspection was made of these chambers or compressors, the operation of pumping the water heated by feed-water heaters to the boiling point into the compressor, so as to expel all fixed air. A pressure of 60lb., indicated on the gauge, is maintained. The heat is further increased by steam coils round the inside of cylinders, so that every trace of air is removed from the compound, and for this purpose also the sand is heated before being mixed. The great importance of this extraction of all air is obvious in the production of a homogeneous material free from all vents, air-bubbles and cracks.

The specimens of stone produced by this process which were inspected were enough to show the capabilities of the material for architectural and decorative uses. One block, about 4ft. long, which had been worked as a mitred cornice, had particularly sharp and clean arrises, and the mouldings were much cleaner than we have seen in the natural stone. The colour is also agreeable without that bluish or greenish tinge which spoils many kinds of artificial stone, and it, too, can be varied by the kind of sand or oxide employed. In another specimen we noticed an architrave moulding returned with mitre, equally sharp in the edges. Other blocks were being chiselled—the tool in every case showing a hardness and fracture equal to the real Portland stone, though the blocks had not become thoroughly hard. When allowed five or six weeks to dry, the material compares favourably as regards hardness and texture with the best stone. The Owen stone has this advantage, however, that it can be worked immediately after coming from the mould, the point of a knife not being able to penetrate it to any depth. We are quite sure that for relief carving and ornament the Owen artificial stone possesses distinct advantages on account of its great homogeneity and evenness of grain. Several specimens of carved and turned stone are exhibited by the Owen Stone Company, which show that for friezes, panels, carved capitals, and external and internal decoration for church and other purposes, a considerable saving may be obtained, as the undercutting and relief are fine and sharp. The main object of the Owen Stone Company, however, is to supply building stone for ordinary building purposes, and we understand that considerable demand has already arisen for it. We are told that Owen stone can be supplied at half the cost of Portland stone. Be this as it may, the Owen stone has all the elements which make for a successful building material. It is not stratified, as a natural stone

is—a source of disintegration and decay; its weathering properties are found to be equal to those of Portland stone, and its behaviour when subjected to intense heat and then cooled by water proves it to be superior to any natural stone. With these physical advantages and its uniformity of texture, which allows it to be moulded and carved, it ought certainly to prove a success.

THE INSTITUTION OF CIVIL ENGINEERS.

SIR JOHN WOLFE BARRY gave the presidential address at the opening of the 79th session of this Institution on Thursday. He remarked that in his inaugural address last year he attempted to review the progress of engineering, and the history and developments of the calling during the past sixty years. On the present occasion he proposed to discuss domestic affairs, as not only touching the home of the Institution, but also embracing matters which might effect its members either as a body or individually. First, as to the Council, on which so much of necessity depended. Every member of that body was elected annually by ballot, and recently a system had been introduced by which it was recommended to the electorate that a certain proportion of the Council should be resident at various important centres outside of London, and, indeed, of the kingdom. He had not the slightest doubt that this system was well conceived and was a good one. It had been already, and would be in the future, very successful. But it must not be forgotten that on those members who were resident in London or its neighbourhood, and could consequently be assembled frequently at the council table, the main burden of government and the ultimate decision on important matters must devolve. Thus the system of local representation should not, in his opinion, be carried too far, and a large proportion of the whole council ought to be elected in the future, as in the past, from London or its suburbs. The ordinary work of the council grew, and must further increase with the numbers and importance of the Institution, now numbering 7,075 members, associate members, associates, and students on its roll. The increase in members of the council made last year had, up to now, avoided any inconvenience from the increase in the number of local representatives. In connection with the widely-spread interests of engineering, it was his individual opinion that it was for the good of the Institution and of the profession that the class of Associates should be carefully encouraged and developed, and he personally should like to see the class strengthened, not merely by an increase of numbers, but by the selection of many eminent and representative men of various other professions or of no profession, who were interested in engineering subjects. The Institution had made a new departure in the inauguration this year of its Engineering Conference in London, which occupied three days, in May. Their first Conference completely realised the expectations of the Council, while he believed it gave general satisfaction to the members. Upwards of 400 members were present at the opening meeting, and the minimum estimated number of those who attended the Conference was 850. The division of the Conference into seven sections, representing more or less distinct lines of engineering thought and practice, afforded a useful means of meeting the overlapping of ideas and treatment in the various departments of engineering activity embraced by the Institution. Another very important matter which had occupied much of the time of members was that of the examinations for admission to the class of Associate Member, the first of which examinations had already taken place. The regulations for the examination syllabus had been so made that, while insuring that every candidate should satisfy the examiners on matters of general principles of science, each person might qualify in the particular branch of engineering which he had studied or to which he desired to devote himself. While an advocate of examinations for the purpose of insuring that a man possessed the qualification of theoretical knowledge before he was classed as an engineer, he held that practical knowledge was at least as necessary as theory. Such practical training as would make a true engineer could only be secured in the old-fashioned way, by a young man seeing work done. The President concluded by alluding to

the accommodation for the ordinary work of the institution afforded by the new premises, and to the advantage that might be enjoyed in the possession of a great hall, with the adjunct of a museum of engineering materials and models. Whilst, having regard to the expenditure already incurred in rebuilding, the institution itself might not be justified in entertaining such an idea, he hoped that it might some day possess a hall not inferior to those which had in late years been erected by the munificence of the donors of the Bute, the McEwan, and the Usher Halls at Glasgow and Edinburgh. He threw out this suggestion for the contemplation of some benevolent millionaire.

On the motion of Sir Frederick Bramwell, seconded by Mr. Edward Woods, a cordial vote of thanks was passed to the President for his address.

The President afterwards presented the medals and prizes awarded by the Council for the last Session.

ST. PATRICK'S CATHEDRAL, MELBOURNE, AUSTRALIA.

THIS church was opened by a solemn ceremonial on Sunday last, Oct. 31. In 1858 Mr. W. W. Wardell, F.R.I.B.A., was commissioned to prepare a design for a cathedral church, suitable for a diocese which promised to be so important and populous. It was, however, stipulated that the materials of the existing building should be used again, and that the part of the then existing aisle in use should be incorporated in the new building. These were unfortunate conditions, as they necessitated the use of bluestone for the walls, and governed the floor level of the new building, with the result that the part of it east of the transepts is below the level of an adjacent street, and they also account for some of the minor details in the present nave. Under these conditions the design was prepared, and the first stone of the new edifice was laid by Bishop Goold, on Dec. 8, 1858, since which time the works have steadily continued, almost without interruption, until now. The design, in addition to the cathedral, comprised a remodelling of the present archiepiscopal residence for the purposes of a diocesan seminary, and the erection of another house for the archbishop to replace it. But neither of these works have yet been commenced. The full design for the cathedral is completed, except only the three towers and spires. One of the western towers is, however, ready for the spire, and contains a peal of bells; and the other is up to the bell-chamber for the second peal. The central tower extends at present to about 10ft. only above the intersection of the nave and transept roofs.

The architecture of the building is English Gothic of the style of the 14th century, and may be described as an adaptation of the Geometrical Decorated. The building is constructed in bluestone, with freestone dressings. It comprises nave, transepts, and sanctuary, with aisles to each on both sides, and three spacious sacristies. The sanctuary has an apsidal end and is surrounded by the aisles, from which open out five semi-octagonal chapels. One of these, much longer than the rest, is the Lady Chapel. There is also one larger chapel, opening from the transept aisle, to receive the altar of the Holy Sacrament, and a corresponding one from the opposite transept aisle intended for the organ and choir, as the present unsightly structure at the west end, forming an organ loft, was only improvised as a rough and temporary measure until the proper chamber was built. The main roofs of the cathedral are in open timber work, except the sanctuary, which has an elaborately-panelled and ornamented ceiling under the roof timbers, springing from a very richly-carved cornice. All the chapels and aisles have groined ceilings in New Zealand stone, with carved bosses at the intersection of the ribs. The dimensions of the building are as follows:—

Nave, sanctuary, and Lady Chapel, clear internal length.....	320ft.
Nave and aisles and transepts and aisles, internal width each.....	76ft.
Transepts, internal length.....	162ft.
Height of main roofs to ridges.....	98ft.
Height of western towers and spires to be.....	208ft.
Height of central tower and spires to be.....	290ft.

There are three sacristies attached to the cathedral, each 30ft. by 20ft. internal dimensions—one is for the archbishop, and the two others for the clergy and acolytes respectively. The

two principal ones have a strong-room each for church registers, plate, &c. Several of the cathedral windows are filled with stained-glass, by Messrs. Hardman, Powell, and Co., of Birmingham, and it is not too much to say that the large window at the western end is one of the finest modern productions in stained glass; but its effect, and, indeed, that of the whole internal western end of the church, is cruelly interfered with by the misplaced organ gallery, much against the wishes and intentions of the architect. In the chapel of the Holy Sacrament a stone frame in compartments, forming a reredos over the altar, is fixed ready to receive mosaics from the atelier of the Murano Company (late Salviati) of Venice. At present only one of these compartments is filled, and contains an exquisite mosaic representing the Crucifixion of Our Saviour, with Mary and John. The stained glass in this chapel is from Munich. The altars in this and the next adjoining (mortuary) chapel are not yet provided. The high altar is constructed in the Spanish marble known as Emperor Red; the frontal is divided into three compartments by small columns of Irish marble, with alabaster caps and bases, and the intermediate spaces are decorated by mosaics representing Our Saviour, the Blessed Virgin, and St. Joseph. The tabernacle and throne for the Holy Sacrament attached to this altar are of alabaster. The latter is in four stages of highly enriched work, and terminates in a spire about 25ft. in height from the sanctuary floor. This altar, tabernacle, and throne, and the altars in the Lady Chapel, and that of St. Bridgid, which are of alabaster, have been executed by Messrs. Farmer and Brindley, architectural carvers, London.

The works throughout have been carried out from the designs of the architect, Mr. W. W. Wardell, M.Inst.C.E., F.R.I.B.A., who is also the architect of St. Mary's Cathedral, Sydney. The contractor for the western portion of the cathedral was Mr. John Young, now of Sydney, and for the eastern portion, the last contract, the late Mr. James Young, of Melbourne. The cost of the building may be taken to be about £150,000, but it must be borne in mind that a large portion of it was executed at a time when the prices of wages and materials were very far in excess of those that rule at present.

CONSTRUCTION OF ARCHES IN CONCRETE.—XIII.

SOME considerable difficulty was experienced in effecting the necessary alterations in the old abutments, which had served as the supports of the three previous bridges of stone, brick, and concrete respectively, in order to render them suitable for the experiments upon the next arch. A quantity of the old material was removed, as it was so damaged as to be almost useless, and was replaced by large monoliths, some of which weighed as much as four tons. These stones were lifted from different levels to a maximum height of 16ft. The Monier type of construction belongs to what we have named the compound system, and consists of an arch of cement, strengthened with continuous metallic trellis-work, both over the intrados as well as over the extrados. This steel framework was composed of two sets or series of component members, the one set running in a longitudinal direction, and the other transversely, or at right angles to the first. The longitudinal members were steel rods, 92ft. in length, and $\frac{3}{4}$ in. diameter, and those at right angles to them were plain flat bars, 7ft. in length and $\frac{3}{4}$ in. in breadth. A width of $3\frac{1}{2}$ in. was given to diamonds forming the meshes of the steel frames, of which the lower or intradosal was built up upon the centring, and the upper or extradosal was put together on the site, and raised to its place afterwards. An elevation and cross-section of the Monier arch are represented in Figs. 1 and 2, and there are one or two points in which it differs from its predecessors, and which are deserving of attention. The span, rise, and breadth of all the experimental arches were constant; but in the compound system, as seen in Figs. 1 and 2, the extrados is of a parabolic contour, while the intrados is a true segment of a circle. It arises from this want of concentricity in the two arch curves, that a very much greater depth is given at the springings than at the crown, the actual dimensions being 1ft. 2in. at the latter point and 2ft. at the two former. This difference, or, in fact, any difference at all, did not obtain in the concrete arch described in our last article, and the consequent disadvantages

FIG. 1.

resulting from the neglect of the proper proportion of depth at these respective points of the structure were fully expatiated and animadverted upon.

Another very important detail was insured in the building of the compound Monier arch, which was purposely set aside in the simple example of concrete. It was the particular composition or mixture of the cement, which was not of a three-fold character, as in the plain concrete example, but was of a uniform consistency throughout the whole of the arch. The proportions adopted were 1 part of Portland cement and 3 parts of sand, by volume. A reference to Fig. 1 will point out that both the upper and lower metallic lattice-work were prolonged well into the body of the abutments—in reality, as far as 6ft. 6in. So soon as the abutments had been brought to the proper level, preparations were made for cementing or concreting the lower steel framework, which, for this purpose, was raised by small packing-up stones to clear the centring upon which it has hitherto rested by about $\frac{1}{4}$ in. The cement was most carefully rammed so as to avoid all hollows and irregularities, and to be thoroughly spread over the steel gridiron with a uniform thickness. Instead of commencing, as in the previous experiments, at the springings of the semi-loaded arch and working towards the crown, the building was carried on simultaneously at four points—viz., at both springings, and at points situated midway between the crown and each springing. At the termination of the operations, the arch was thus closed and consolidated at three points instead of only one, as formerly, at the crown. Great care was observed to effect the most complete and intimate corporation and union of the steel and the cement, for upon this being accomplished depends the whole value of the compound system.

With this object in view, the cement was rammed in consecutive layers of a thickness of 6in., until the level of the uppermost layer was just 4in. short of the total depth of the arch. At this stage of the proceedings, the upper trellis frame, which weighed nearly a ton and a half, appeared on the scene. It was literally "tackled," or laid hold on, at some fifty different points, and slowly and gradually lowered to its proper position. When it was once fairly down, it was subjected to the same process of cement ramming as its lower neighbour, and the work continued until the whole arch was completed. A thin top layer of neat cement was ultimately spread over the whole extradosal surface, and the structure was then left to repose a little while before the striking of the centres and the subsequent testing were to take place. During the construction of the arch, samples were taken of the cement employed, and tested to ascertain their ultimate powers of resistance. It should be noted, especially by students and young architects and engineers, that the results arrived at, from experiment and tests upon comparatively small specimens of mortar, concrete, cement, or any other material or combination of materials, will not give the same breaking weight as when the same tests are imposed upon specimens of considerably larger dimensions. The volume of the arch, including the abutments, amounted to 1,400c.ft. Two months were allowed to elapse before any attempt was made to interfere with the wedges supporting the centring, and an additional month intervened previously to submitting the arch to the *peine forte et dure*. After the testing, to which we shall refer later on, and which culminated in the arch finally giving way under a total load of 12,756 tons, the crown recovered itself slightly, although by that time the permanent damage was done. When the task had to be undertaken of breaking up the structure, and disintegrating what small portions had been left intact, the cement was found to be, especially between the lower and upper metallic trellis frames, of very exceptional hardness and tenacity. The extraordinary hardness and solidity of first-class cement work can only be properly appreciated by those who have not only built it, but had to pull it down

FIG. 2.

again. We can call to mind a case which came within our province. It was a case of getting in the foundations and beds for some vertical engines, and the holding-down bolts were inserted in the brickwork according to the wooden templet supplied. When the cast-iron engine bed-plates arrived they would not fit. Some blunder had been made between the pattern-maker and the foundry department, and there was only one course to adopt, that was to pull down the brick-in-cement foundations, and rebuild them with the bolt-holes in their proper positions. Picks, steel wedges, and cold chisels were tried with a very small amount of success, and the demolition was finally and far more expeditiously accomplished by a small charge of dynamite. A few words remain to be said about the behaviour of the steel trellis frame. The upper was deformed and twisted to a very considerable extent, as might be expected from a test pushed *à outrance*; but it was not severed in any place. This is simply a result due to the nature of the stresses it had to encounter, which were of a tensile character. It also appears that the adhesion of the cement and the steel rods and bars was perfect, as manifested by the total absence of all rust or corrosion between the two different materials.

The upper trellis work having been disengaged, the rods and bars were detached from the abutments, the connection between the longitudinals and transversals being cut out, and the general demolition of the structure supervened. It was with great trouble, and with a large development of hard knocks and "elbow grease," that the disconnection between the steel trellis and the cement was finally accomplished. The work of stripping the steel skeleton frame of all the concrete adhering to it was continued until nothing but the metallic bones were left. All the rods and bars of the steel lattice work were more or less twisted and bent out of shape; but none of

FIG. 3.

them were actually ruptured. In Fig. 3, the diagram drawn to the same scale as those for the vertical deflections of the three other bridges, shows the value of the deflections in the Monier arch. The maximum displacements after the removal of the centres in both a vertical and horizontal direction, were of so trifling an amount as to be not worth recording. It was not until the load reached 2½ tons per running foot that the first cracks made their appearance, which was equivalent to 0.312 tons per square foot. With this load, the vertical and horizontal deflections attained respectively the dimensions of 5in. and 3in. The same phenomena, with regard to the closing-up of the fissures after the removal of the load and their reappearance when a load somewhat lighter than that originally improved was laid on, were observed; but as the general conditions were identical, the exact particulars call for no especial notice. With a surcharge of 4.273 tons per running foot, the Monier arch collapsed. This load per foot run was equivalent to a total load of 147,365 tons. There can be very little doubt that the working resistance of the arch was practically *hors de combat* before the ultimate rupture occurred. When the loading had advanced to a little under four tons, the vertical deflections had attained to a maximum of 3in., and the lateral to half that amount. Just at this juncture a crack suddenly made its appearance close to the springing of the unloaded semi-arch; in a few minutes afterwards the entire structure came down quietly and gradually until its further fall was arrested by the temporary staging and supports provided for that contingency.

From the manner in which the ends of the entire Monier arch, including the two steel trellis-frames, are virtually imbedded in the mass of the abutments, it may be considered as regularly *encastré*. Even so, the condition would not impart to the arch type the same advantages which are assumed to accrue to the horizontal beam and girder. In the latter case, though no doubt there is a certain additional amount of strength derived from this mode of fixing the girder to its supports, yet frequently in practice it is not of any great value or importance. In a previous article relating to the testing of the smaller arches, beyond which we have not advanced in England, the method of registering and recording the deflections and displacements of the structure during the whole period of its testing was described and illustrated. At the same time it was stated that for the larger designs a more accurate and precise method would be employed. The chief points claiming attention while the experiment is in progress, are the observation and registration of the horizontal and vertical displacements of the different points of the longitudinal axis of the arch itself, and also—what is of equal importance to ascertain—any displacement to which the supports might be subjected. If the reactions of the supports are inadequate to resist the thrust brought upon them, the best and strongest arch ever built must inevitably come down. There is another description of displacement which must be paid attention to, which will perhaps be best explained by referring to the diagram in Fig. 4. It practically amounts to

FIG. 4.

the angular movement to which any particular cross-section of the arch may be subjected. This movement is a direct stress of torsion, and occurs occasionally during the testing operations, but generally just at the point of failure. Let a cross-section EFGH be made through any part of the arch, as shown in Fig. 4, and let the line AB represent the vertical axis. Suppose this axis to be displaced or shifted from its original position into that of the dotted line CD, then the whole cross-section would be similarly shifted into the position GLKH. Instead of the centre of the vertical axis remaining unaltered, as assumed in Fig. 4, it frequently, in the experiments, moved bodily to one side or the other, and, as a matter of course, took the arch with it. The variations of temperature were likewise observed, but the records are devoid of both interest and utility, except perhaps so far as the steel arch is in question.

SAFETY FOR WINDOW CLEANERS.

MR. D. Y. Annan, of Dundee, a Scotch architect, has invented an anti-accident apparatus, costing about half-a-crown (complete), by means of which, aided by a few screws, all the sashes in an ordinary house can be converted at will into casements, and so be cleaned from the inside. Here is a solution of a long-established difficulty, to overcome which all sorts of expensive contrivances have been patented, and a variety of complicated appliances have been invented. "It abolishes awkwardness and attains acceptable advantage," says Mr. Annan. We have carefully examined the apparatus, and, provided it is as carefully fixed, as a more costly one would certainly have to be, there seems no reason why it should not fairly fulfil its purpose.

For very heavy sashes, glazed with plate-glass, we do not think it is adapted, and we have our doubts as to the capability of an ordinary domestic servant being equal to the task of managing even so simple an affair, in which some care on the part of the user is manifestly necessary. Any ordinary mechanic, qualified to adjust and fix a sash in a workmanlike way, could carry out the instructions furnished with the removable hinges, which slot on to screws placed in the frame of the window ready for use at any time when the cleaning has to be done. The bead batten, keeping in

the lower sash, slots on also, and the sash cords have to be made to hook on and off to enable both the upper and lower sashes to swing inwards, of course, as casements. The two adjustable butt hinges suspend the lower sash, and two coupling slotted pieces are adjusted to the top rail of the top sash and meeting rail of the bottom sash, the two sashes thus united swing out into the room, and so enable the cleaner to get at the outside of the glass from the inside without standing on a chair or using steps. Nothing could be more simple when you know how to do it, and the only way to really accomplish the feat is to learn by experience. Whether the landlord would agree to his tenants cutting about the sashes of his houses in the fashion necessary to enable Mr. Annan's apparatus to be used is another matter. It would be safer to consult the owner first, anyhow.

CHIPS.

The new clubhouse of the Lytham and St. Anne's Golf Club, built to the plans of Messrs. Woolfall and Eccles, architects, Liverpool, is now completed. Messrs. Robert Garnett and Sons, Warrington and Southport, have taken the contract for the furnishing.

The new Liberal Club at Acock's Green was opened by Earl Spencer. The building has been erected at a cost of £1,200. The architect was Mr. E. E. Wykes, and the builders were Messrs. Williams and Body, Acock's Green.

A cottage hospital is in course of erection on the London-road, Chippenham. The dimensions will be 72ft. by 56ft. The outside walls will be built of brick, and the elevation will be of the same material, with three gables, all of which will be stuccoed. On the ground floor will be a male ward, and a female ward for each three beds. Separate male and female rooms, also sitting and bedrooms for nurses, bath-room, kitchen, and sanitary offices are provided. Upstairs will be servants' bedrooms, &c. The contract has been taken by Mr. John Smith, of Chippenham, at £1,250.

At the Norwich Consistory Court last week, a faculty was decreed for filling the three-light east window of St. Margaret's Church, Leiston, East Suffolk, with stained glass as a memorial to the late Mrs. Frank Garrett. The object will be the Ascension.

At Friday's meeting of the town council of Salford, Alderman Bow approved the adoption of a new code of building by-laws prepared by the Building Committee. He said the by-laws as framed were the result of very mature deliberation, extending over a considerable number of years. It had been endeavoured to assimilate the by-laws to those of Manchester. He believed they were as complete a set of building regulations as those of any town in the country. After discussion, however, in the course of which several members stated that they had not had time to read the proposed by-laws, consideration of the matter was postponed till the next ordinary meeting of the council.

At Towyn parish church last week a new organ, built by Messrs. Ingram and Co., of Hereford, at a cost of £350, was publicly opened.

Mr. James Knox Taylor, chief of the draughting division in the supervising architect's office at Washington, D.C., has been appointed supervising architect of the United States Treasury, as the result of the special examination instituted by Secretary Gage.

At the Temperance Hall, Yelverton, South-West Devon, on Friday, Lieut.-Col. A. C. Smith, R.E., one of her Majesty's Local Government Board inspectors, held an inquiry into the application of the Tavistock Rural District Council to approve the constitution of Yelverton into a special drainage district, comprising portions of the parishes of Buckland Monachorum and Meavy, and for sanction to borrow £3,000 for the purpose of sewerage and sewage disposal for such district.

North-street Congregational Chapel, Atherstone, a building erected early in the present century on the site of a meeting-house built in 1794, was reopened last week, after having been decorated and repaired by Mr. John Wright, of Nuneaton.

The cost of the Widnes Municipal School and Free Library has exceeded the estimates by some £2,700, and at the last meeting of the town council a notification was received that an anonymous individual had offered to defray this sum.

The many friends of the Rev. R. Medley Fulford, formerly an F.R.I.B.A. in active practice with Messrs. Harvey and Tait at Exeter, who took holy orders eight or nine years since, and went out from Devonshire to St. Andrews, Grenada, will be sorry to learn that he has been ill with fever, and although he is now slowly recovering, the doctor strongly advises his return to England. As a consequence, Mr. Fulford will probably be back by the beginning of April.

OBITUARY.

THE death of Mr. THOMSON PLEVINS, one of the oldest and best-known architects and surveyors in Birmingham, took place on Sunday afternoon at his residence, Eaton-road, Coventry, at the age of 72. The deceased was the son of Mr. Plevins, of the firm of Messrs. Pashby and Plevins, builders, and was born in Birmingham in July, 1825. Mr. Plevins, sen., subsequently became a surveyor, and when his son's education was completed he took him into his office, and taught him the profession of an architect and surveyor. When Mr. Thomson Plevins was twenty-one his father died, and he then began to build up a practice in Waterloo-street. His expert knowledge of the laws of building was invaluable to clients engaged in litigation, especially when questions relating to rights of ancient lights were involved, and for many years past there were few important cases tried in the Midlands in which he was not employed as an adviser and witness on one side or the other. Mr. Plevins was also largely employed in negotiating sales of land and property to railway companies and corporate bodies. In compensation cases his advice was also sought by property-owners. When the Birmingham Improvement Scheme was projected, Mr. Plevins was retained by nearly the whole of the owners of the property in the scheduled area, and he was employed either in effecting a settlement with advisers of the corporation, or as a witness when, in the Arbitration Court, the amount of compensation had to be judicially assessed. He was employed in a similar capacity by the owners of the property which was purchased for the enlargement of New-street Station, and he further negotiated the sales of the property acquired by the Midland Railway Company in connection with their enlargement scheme in Suffolk-street. For many years Mr. Plevins was the consulting architect employed by the late Isaac Horton, and was responsible for the erection of many of the largest blocks of offices and commercial buildings in the central parts of Birmingham. He designed the group of buildings, including the Midland Hotel, extending from the London and Midland Bank to Lower Temple-street; the original Grand Hotel in Colmore-row; Colmore Chambers, Newhall-street; Union Chambers, Temple-row; and groups of buildings in New-street, High-street, Corporation-street, Spicel-street, and other central thoroughfares. Mr. Plevins devoted himself exclusively to his business, and took no active part in the public life of the city, politically or otherwise. Mr. Plevins leaves a widow and four children, the eldest being about 17 years of age.

MR. ROBERT JOHN HARRISON, engineer and surveyor for the borough of Derby, died on Friday of consumption. He was a native of Southampton, where he received his early training in H.M. Office of Works, under the late Sir Henry James. He afterwards practised as a surveyor in the South of England, but went to Derby in 1877, and held his office since 1888.

MR. WILLIAM RADFORD, civil engineer, of Manchester, and for many years chief bridge master and surveyor of bridges in the County Palatine of Lancashire, died on Monday at South Lea, Whalley Range, in his 81st year. Mr. Radford was born in the Adelphi, Salford. He was educated at the Manchester Grammar School, was afterwards articled to a firm of engineers, and for some time he was engaged in the construction of the Altona and Kiel Railway. Similar work in Denmark gained him the Order of Merit. In 1850 he settled in Manchester as a civil engineer, and was appointed bridge master and county bridge surveyor for the Hundreds of Salford, Blackburn, Leyland, Amounderness, and North and South Leyland. Mr. Radford, who was many years chairman of the Moss Side Local Board, was twice married.

MR. JAMES BURGESS, a well-known master builder of Westbury, died on Saturday, aged 68 years. It is many years since the deceased made a name as a builder and restorer of churches, and he had executed more work of that character than any other builder in Wiltshire. He restored or built no less than 40 churches, not only in the diocese of Salisbury, but in all parts of the country, and at the time of his death he had charge of the building of the new St. Boniface College, Warminster, the estimate of which was £10,000, the building of Atworth Vicarage, the Westbury Cottage Hospital, &c. His chief works were the restoration of the famous church of

Edington at a cost of £8,000, and the beautiful Phipps mausoleum in Westbury Cemetery. In local affairs he took a keen interest. He leaves a widow and large family.

THE death occurred at his residence, Hoole, Chester, on Tuesday, of Mr. R. GRANDIDGE, J.P., timber merchant, sawmill proprietor, and shipowner. He was one of the largest importers of Norwegian timber into Liverpool. He was extensively engaged in the crescenting of railway sleepers, and was proprietor of a timber merchant and saw miller's business at Rochdale, which had been in his family for generations. He was chairman of Hoole Urban District Council, and was recently placed on the commission of the peace. He leaves a widow, but no children.

The Wesleyan Chapel at Bolton Brow, near Halifax, was re-opened, after undergoing alterations for the new organ, on Wednesday week. The old choir gallery has been removed and a new gallery substituted at a lower level. The organ has been placed on the new gallery, the organ case entirely filling the recess. In front of the organ are the choir stalls and the rostrum, executed in selected pitch-pine and oak, the rostrum front being bracketed out to allow of the Communion table being formed underneath. Altogether, including the organ, the total cost has been £1,300. Mr. J. Binns, of Bramley, has built the new organ, and the improvements, including the erection of the organ case, have been carried out by Messrs. Fielding and Bottomley, of South Parade, Halifax, from the designs and under the superintendence of Mr. A. G. Dalzell, architect, of the same town.

The Parliamentary notices have just been served on the owners and occupiers of land in the area affected for a proposed light railway to extend from Haxey Station, on the Great Eastern and Great Northern joint railway, to Gooles Fields, near Gooles, at which point it will connect with the Gooles and Marshland light railway, which the Commissioners have already intimated they will sanction. The new line, which will be called the Isle of Axholme Light Railway, will be 23 miles in length, and be of 4ft. 8½in. gauge. The engineers are Messrs. Mammatt and White, of Leeds.

A special meeting of the Ipswich Dock Commission was held on Friday to consider the proposals of the Great Eastern Railway Company for carrying out extensive improvements on the riverside. By a majority of 20 to 4 the general scheme was formally approved. The railway company will promote a Bill next session for carrying out works for facilitating the traffic round the dock, including extra accommodation at Ranelagh-road, Princes-street, and Bridge-street crossing, and the construction of a dam across the New Cut, in accordance with the plans submitted to the commissioners, and undertake to carry out all the works within five years. The dock commissioners and corporation of Ipswich obtained Parliamentary powers for constructing a similar dam across the narrow portion of the Orwell known as the New Cut; but, owing to the anticipated outlay, allowed this to lapse.

New Victoria Board Schools in Fearnley-street, Watford, were opened last week. The building is of two stories, and accommodates 1,020 children. The girls' school consists of four classrooms, each for 60 children, and a central hall 35ft. by 31ft. The infants have a similar central hall adjoining, and communicating with five classrooms, accommodating 300 children. The boys' central hall is 71ft. by 34ft., approached by two stone staircases, with eight classrooms arranged on three sides of same, each for 60 boys. The external facing materials are grey bricks, with dressings of red brick and stone. The architect is Mr. A. P. Ayres, of Watford.

The opening of the new gallery and balcony in the town-hall at Downham Market, took place last week. The hall was built in 1837 to commemorate the Jubilee, and the balcony has now been added in commemoration of the Diamond Jubilee. The funds for carrying out the work have been raised by private subscription, the contract being intrusted to Messrs. Collins and Barber. The seating accommodation is about 150.

All Saints' parish church, Chebsey, was reopened on Tuesday by the Bishop of Lichfield, after restoration. The repairs have included covering the roofs with new tiles and their timbers with oak boards; putting mullions and tracery to the denuded windows; also concreting the whole internal area in cement, and laying same either with oak blocks or tiles; stripping the modern plaster from the walls, reglazing most of the windows, opening out the old north doorway, the erection of an oak chancel screen, fitting the body of the church with chairs, fixing the old pewing as wainscot to the walls, the construction of new heating apparatus and chamber, fitting the chancel with alabaster retable and clergy stalls, and new drainage in the churchyard.

Building Intelligence.

ABERDEEN.—The opening of the new medical block at Aberdeen Royal Infirmary, the completion of which marks the reconstruction of the extended buildings commenced in the Jubilee year, took place last week, the ceremony being performed by the Dowager Countess of Erroll. The cost of the reorganised infirmary has been upwards of £70,000. The medical block just finished has a frontage to Woodmanhill of about 200ft. It is four stories in height, the style harmonising with the surgical and pathological blocks on the opposite or Spa-street side of the infirmary ground. On each of the first three floors are two wards with beds for thirteen patients, and the fourth ward will be an erysipelas ward for eight patients. There is also an isolation single-bed ward. The architects for the new block were Messrs. W. and J. Smith and Kelly.

BRISTOL.—Cotham Wesleyan Church in Lower Redland-road was reopened last week; it was originally built and completed nineteen years ago. The main portion of the church was, however, destroyed by fire on the 24th of October of last year, so that the restoration, together with the enlargements and improvements, has therefore been completed within the space of twelve months. Messrs. Stephens, Bastow, and Company, Ltd., builders and contractors, of Bristol and London, were the contractors for the original buildings, and the same firm has now been intrusted by the trustees with the restoration and enlargement, under the direction of the architects, Mr. Robert Curwen, A.R.I.B.A., of London, and Mr. Herbert J. Jones, M.S.A., of Bristol. The amount of the contract for the rebuilding and improvements was £6,555. The roof, the seating, the pulpit, and the whole of the internal joinery and fittings to the chapel itself are executed in pitch-pine. The panelling to the long stretches of gallery front is filled in with figured pitch-pine, as are the fronts to seats and the pulpit. The choir stalls are at the back of the rostrum, and in that space will be the organ keyboard, whilst the organist's place will be between the choir stalls. Mr. W. H. Bromley, of Corsham, has acted as clerk of works.

EXMOUTH.—A new Wesleyan chapel and schools in Tower-street were recently opened. The style is Decorated Gothic. The church consists of nave, transept, and chancel (with octagon end), organ chamber, vestries, tower and spire (rising to a height of 95ft.), and vestibule. A gallery runs across the end of the church. The roof is waggon-headed, and, like most of the interior woodwork, is of pitch-pine. The pulpit is of carved oak, as also is the Communion-table; the panels of the table are filled with needlework designs in gold silk on red velvet. The accommodation is for 620 persons. The school buildings consist of a schoolroom, 54ft. by 32ft., into which open five classrooms and an infants' room. There is also an adult classroom. The architect was Mr. W. J. Morley, F.R.I.B.A., of Bradford, his design having been unanimously chosen in competition. The work has been carried out under the supervision of Mr. Richard Morley, the son of the architect. The contractor is Mr. Gibson, of Exeter. The stained glass is by Mr. Lazenby, of Bradford. The heating has been carried out by Messrs. Thomas Wood and Co., of Bristol, on their low pressure system. A large three manual organ has been placed in the organ-chamber; it has altogether 1,500 pipes, and was built by Mr. Minns, of Taunton. The total cost of the site and buildings is about £7,000.

EDINBURGH.—A new pavilion is to be added to the Royal Infirmary to commemorate the Queen's Diamond Jubilee. It will be placed at the southern end of the infirmary grounds, and resembles in outward appearance the other pavilions, so far as its larger size and the difference in its internal arrangements will permit. It consists of a basement (entirely above ground), three floors of wards, and an attic floor. The basement contains a bathing establishment, including a Turkish bath, with three hot rooms, a needle bath, douche baths of various kinds, a vapour bath, and sulphur and other medicated baths. A cooling room is provided, and there are also dressing-rooms, hot linen rooms, attendants' rooms, lavatories, &c. In the basement, two four-roomed houses for resident officials are also provided. The three floors above the basement contain three wards for the treatment of diseases peculiar to women. At the

southern end of the pavilion is, on each floor, a ward of 22 beds. Off the corridor are, on one side, an operating-room, two special wards of two beds each, a waiting-room, a demonstration room, and a physician's room; and on the other, a kitchen, a bathroom, lavatory, and other conveniences, an isolation ward, a linen room, and nurses' parlour and bedroom. The attic floor contains 14 rooms for nurses and nine rooms for servants, besides bathrooms, lavatories, &c. The pavilion altogether provides accommodation for 97 persons, excluding the two houses in the basement. The walls are lined with brick, with a hollow space between it and the main wall. Glazed tiles are freely used, both in walls and floors, in corridors, bathrooms, lavatories, kitchens, operating-rooms, staircases, &c. The floors are constructed of iron and concrete, without wood joists. The ward floors are laid with hard-wood planks, but these are nailed into a thick coat of specially prepared asphalt, laid above the concrete. The whole building is thus fire-resisting. The corners are widely rounded, and cornices, door mouldings, &c., are almost entirely absent. The pavilion is warmed by steam in pipes and coils, and the foul air is to be removed by electric fans placed in a tower. The lighting is to be by electricity. The total cost will be about £40,000. The architects are Messrs. Sydney Mitchell and Wilson, 13, Young-street, Edinburgh.

MOTHERWELL.—The Lanarkshire Middle Ward Fever Hospital, the fifth which has been provided by the district committee for the treatment of infectious diseases in that ward of the county, was formally opened at Motherwell recently. The new hospital is situated on rising ground, having an area of six acres. It accommodates 100 adult patients, 80 being equally distributed among four pavilions, and the remainder accommodated in eight private wards of one bed each, one isolation pavilion of six beds, and one observation pavilion of six beds. The four ward pavilions are arranged on the ground on *échelon* with the axis north and south. Each pavilion is divided into two 10-bed wards, and has two separation 1-bed wards attached. The main wards are 60ft. long by 26ft. wide and 13ft. high, giving to each bed 12ft. linear wall space, 156sq. ft. of floor space, and 2,028ft. of cubic space. The floors are of pitch-pine, wax polished, and between each bed is a window 2ft. 6in. from the floor, and extending to the ceiling. The wards are heated by means of open fireplaces and low-pressure hot water, the latter apparatus consisting of cast-iron pipes under the floor circulating water from and to a steam heater in the basement. These pipes have branches rising to radiators in the wards, and in this way the floors of the wards are kept free of heating pipes. The cost of the hospital, including all fittings, apparatus, machinery, furniture, and fees, will be about £37,000, or about £370 per bed. Mr. Alexander Cullen, Glasgow, is the architect.

RASHCLIFFE.—A new infants' school in connection with Rashcliffe church school was opened on Saturday. The school is situate in St. Stephen's-road, opposite the church, and is Gothic in style, in consonance with the church. It contains a central hall 31ft. 6in. by 24ft., and two classrooms, providing accommodation for 30 children each, and a babies' room for 50 children, whilst 75 places are provided in the central hall, making a total of 185 places. The divisions between classrooms and hall are movable glazed partitions, so that all the rooms can be transformed into one, and made to serve a parochial hall. There are also a cloakroom and lavatory. All the internal joiners' work is of pitch-pine. The school is heated with hot water on the low-pressure system. The accepted tenders amount to the sum of £1,510. Mr. J. Berry, 9, Queen-street, Huddersfield, is the architect.

RATHMINES.—The new town-hall, which has been two years in course of erection, from plans by Mr. Thomas Drew, of Dublin, will be opened during December. The hall has a frontage of 48ft., and the depth from front to rear is 189ft. The greatest height to roof is 80ft., and to summit of tower 125ft. The chief feature on the ground floor is the large assembly-room, which is fitted with a stage, and has been provided with a gallery. The room will accommodate on area and in gallery 940 persons. The room is lighted by electricity, as, indeed, are all the other sections of the building. The other apartments on the floor are the secretary's offices, public office, collector's office, sanitary office, engineer's offices, public and private, and the gymnasium. On the

first floor, which is reached by a Portland stone staircase, with wrought-iron gilt balustrade and ebony handrail, is the board-room, 50ft. by 30ft., and having a mullioned bay window at one end filled in with lead lights. Over it is the supper-room, also 50ft. by 30ft., having an open roof of pitch-pine springing off stone corbels. This room will accommodate between 600 and 700 guests. The approach to the supper-room is by a pitch-pine staircase. On this floor there are also a number of servants' apartments. The joinery work, the entrance and swing doors, are all of oak, with oak trimmings. Messrs. Goode were the builders, and Mr. P. Coyle the clerk of works.

SOUTH SHIELDS.—The foundation-stone of the John Redhead wing of the Ingham Infirmary will be laid to-morrow (Saturday), by the Earl of Durham. The wing, which will be two stories in height, is being erected to the north of the present block, and, like it, is Classic in character, and the aim of the architect, Mr. H. Grieves, has been to make it symmetrical with the original scheme. The main wards, which are 95ft. 8in. by 26ft., are placed towards the rear. The bathrooms and lavatories are placed at the east end with disconnected lobbies. A balcony on the first floor is provided. The whole of the windows are to be fitted with double-hung sashes. Each patient will be provided with a separate locker. The ward kitchens, 13ft. 6in. by 12ft. 3in., adjoin the main wards, while the nurses' sitting-rooms are also adjacent. At the west end of the new wing are the isolation wards, 19ft. by 14ft. The convalescent, day, and dining rooms are each 18ft. by 16ft. A staircase, with a lift in the well-way, is provided in a central position. In each of the two large wards there will be 20 beds, and two beds in each of the four small ones. The walls will be of brick, with stone dressings, while the roofs will be covered with Westmoreland slates laid on boarding. The joiners' work is yellow pine and oak, and all moulded work or projections have been avoided. The heating will be by hot water, and open fires will be provided in the smaller rooms. Two of Shorland's stoves will be placed in each of the large wards, with fresh-air inlets and descending flues. The contract for the new wing has been let to Mr. R. Goodwin, for the sum of £5,928, without furnishing.

STRATFORD-ON-AVON.—The restoration of Stratford-on-Avon Church, wherein lie the remains of Shakespeare, was commenced eight years ago. The sum of £6,000 was then raised by subscription, chiefly in the neighbourhood, and expended principally in the repair of the outside of the fabric and the interior of the chancel. Very little was done to the interior of the nave and transepts, and it is now desired to complete the original design by restoring them. The work is being done under the advice of Mr. G. F. Bodley, A.R.A., under whose supervision the previous part of the restoration was carried out. Three things are aimed at: (1) The rearrangement of the organ; (2) the relaying of the floor of the nave, the cleansing of its walls and pillars, and the substitution of open oak benches for the present pews; also the readjustment and enlargement of the heating apparatus, and the introduction of the electric light; (3) the rebuilding, on a revised plan, of the old vestry, taken down about 100 years ago on account of its dilapidated condition. It is expected that the sum of £5,000 will be required, and an appeal is being made for subscriptions.

WESTBOURNE PARK, W.—The extension of St. Stephen's National school was opened on Saturday by the Bishop of London. The increase in the numbers of places provided will more than double the former accommodation. The new extension occupies the site of three houses purchased for the purpose and pulled down, the frontage of the schools being thus doubled. The basement is used for parochial purposes. Half of the ground-floor provides a room 24ft. by 30ft., the remainder is occupied by the new separate entrances and staircases, as well as the cloakroom for both departments. The first floor gives two large classrooms for 60 children each, while the second floor is the same, except that here the two rooms can be thrown into one by means of a folding partition. The schools are lighted throughout by electricity, and are probably one of the first of the National schools to be so lighted; this work has been executed by Mr. W. Mackie. The building has been built by Messrs. Rudd and Son, of Grantham, under the personal supervision of the architect, Mr. Arthur T. Bolton, A.R.I.B.A., of 2, the Sanc-

tuary, S.W., no clerk of works being employed. The cost has been about £7,000, including the site, which cost £2,000.

CHIPS.

The Whitby Rural District Council have instructed Mr. D. Balfour, M.Inst.C.E., F.G.S., &c., Newcastle-on-Tyne, to report on a scheme of water supply for Robin Hood's Bay, Thorpe-lane, and Thorpe.

A Local Government Board inquiry was held on Tuesday at Westbury-on-Trym, by Mr. W. O. Meade-King, C.E., into an application made by the rural district council of Barton Regis for sanction to borrow £9,500 for the purpose of sewerage and sewage disposal for the parish of Westbury-on-Trym.

In the Council Chamber, Birmingham, on Tuesday, the presentation took place of the three-quarter length portrait of Sir James Smith (the Lord Mayor), painted by Mr. J. J. Shannon, A.R.A., in recognition of the services rendered to the city by the Lord Mayor during his two years of office. The portrait will be placed in the Art Gallery.

A new board school is in course of completion at Eastville for the Bristol School Board. In the centre is a rectangular assembly-hall, with eleven classrooms and a couple of cloakrooms surrounding it. Some of the classrooms are for 50 children, and others for 60; and the total number for which the school is built is 600. The building is of Pennant with Bath stone dressings, and the roofing is of Broomhall tiles. In the interior the rooms are supplied with a dado of glazed bricks. The architect is Mr. E. W. Barnes, of Guildhall Chambers, Broad-street, Bristol; and the contractor is Mr. J. Browning, of Fishponds.

Memorial-stones were laid last week of the Diamond Jubilee Swimming Baths at Bradford-on-Avon. The building will be Domestic Gothic in style, and the external walls will be of Bradford-on-Avon stone. Provision is made for a swimming-bath, lined with white glazed bricks, 42ft. long by 16ft. wide, with dressing cubicles. The depth of the water will vary from 3ft. to 6ft. Five private baths are also to be provided. Mr. Chancellor, of Bath, has taken the contract for the building, and Messrs. Beaven and Sons are carrying out the heating arrangements. The architect is Mr. Sydney Howard, surveyor to the urban district council.

The foundation-stone of St. Chad's parish hall and schools in Westminster-street, Gateshead, was laid on Monday. The building is Domestic Gothic in style. The main front elevation is faced with pressed Commendale bricks with stone dressings, and other elevations are faced with Birtley bricks. The large hall is lined with brick, a dado of cream-tinted glazed brick running round the hall, a sanctuary being formed at the south end. The hall has a high, open-timbered roof. The school has four classrooms, boiler-house, yard, and offices. The architect is Mr. Eugene E. Clephan, of St. Nicholas Chambers, Newcastle, and the contractor Mr. Isaac Bowley, Dunston.

The aggregate amount of sales at the Auction Mart last week, as registered at the Estate Exchange, was £83,760, nearly £20,000 less than the figure recorded for the corresponding week of last year. A considerable number of properties were offered, but the bulk were of the general type of investments of a moderate class, the few brought into the market of a more important character meeting with but scanty success.

At a meeting of Kilmarnock Town Council on Friday, it was reported that Mr. Gale, the arbitrator in the waterworks reference, had allowed the contractor £937 as extras; the sum claimed was £8,500. This being an interim award, the council agreed, on the recommendation of the water committee, to appeal against certain items involving about £100.

A special meeting of the Taunton Town Council was held on Friday to consider a report from Messrs. John Taylor, Sons, and Santo Crimp, of Westminster, on the prevention of the flooding of North Town. The engineers advised the construction of a high-level intercepting sewer, at a cost of £7,350. This was adopted, and it was decided to apply to the Local Government Board for sanction to a loan of £7,500.

The scheme for enlarging St. Mary's Church, Waterloo, Blyth, has taken practical shape. At present the sittings will only accommodate 261 people, but the Diocesan architect, Mr. W. S. Hicks, of Newcastle-on-Tyne, having prepared plans embracing a scheme of gradual extension, and eventually affording accommodation for 1,000 people, the churchwardens adopted the scheme, and let the contract to Messrs. Simpson, a local firm of builders, whose workmen are now engaged on the proposed extensions. The first portion of the work includes the extension of the chancel, the building of a north aisle with organ chamber, clergy vestry, and boiler-house for heating apparatus.

Engineering Notes.

INSTITUTION OF JUNIOR ENGINEERS.—The members of this body visited, on Saturday afternoon, the section of the Central London Railway between Queen's-road, Bayswater, and Westbourne Park, by invitation of the engineers, Sir Benjamin Baker and Mr. F. Hudleston. The visitors assembled at the site of the Queen's-road Station, adjacent to Kensington Gardens, and after having descended by a lift, inspected the enlarged tunnels where platforms will be constructed, and passed eastwards for several hundred yards along the parallel tunnels, each 11ft. 6in. diameter, in which the up and down lines will be laid. At the end of the boring, which is through-out in the London clay, the task of tunnelling with the aid of the Greathead shield was in progress, and the visitors viewed the mechanism for operating this apparatus by hydraulic power, and the arrangements made for the supply of air to the workmen employed in removing the earth excavated by the cutting edge of the shield. Representatives of Mr. John Price, the contractor in respect of this portion of the railway, escorted the visitors.

HEYSHAM HARBOUR.—Messrs. Price and Wills, of Westminster, who have secured the contract from the Midland Railway Co. for the construction of the harbour at Heysham, at a cost of nearly half a million sterling, have commenced operations, and in the course of a very short time there will be nearly 2,000 men at work. The Midland Railway Company have purchased a large tract of land at Heysham, and during the past year Messrs. Godfrey and Liddelow have cut a line from a point on the Lancaster line, near Morecambe, to the seaboard between the Near Naze and Red Nab, and it is between these points that the harbour will be constructed. From the Near Naze, which is on the Manchester side, a breakwater, a mile in length, and built on a curve, will run out to a point exactly opposite the present cutting, whilst from Red Nab, on the other hand, a breakwater, 1½ miles in length, will be constructed so as to almost meet the first-named. At the end of each of the breakwaters there will be a lighthouse, and a pier 2,000ft. long will run from the cutting to the opening in the breakwater, which will be in deep sea. The area inside the breakwaters will be excavated to a depth of 17ft. at low water, and one and a half million cubic yards of sand will have to be removed. The seaboard now rises very abruptly, and something like two million cubic yards of earth and rock will be taken away. The sand and the stone removed from the bay and the mounds will be used in the construction of the breakwaters, but the rock will not be hard enough for the facings, for which probably stone from the Bramley Hall quarries will be obtained. The 2,000ft. pier will reach permanent deep water, and vessels will be able to berth at any time of the day or night. Messrs. Price and Wills are under contract to complete the work in four years.

TUNNELLING SHAP FELS.—The London and North-Western Railway Company are considering the question of improving the gradients on their main line between Tebay and Shap Station. Surveyors have been engaged during the past autumn in trying to find a better route than that which Stephenson founded, and they have staked one out, which is at present under consideration. It strikes off the present line a little north of Tebay, and, passing along the valley of the Birk Beck, passes close by Shap Wells and then enters a tunnel about two miles (and not as has been absurdly stated ten miles) in length, by means of which the worst part of the present ascent is got rid of. The line then rejoins the existing railway near the Shap Granite Works, the whole length of the new line being about 11 miles. An alternative route takes the line near to Kendal, and joins the present railway near Lowther Park.

At the half-yearly meeting of the shareholders in the Hotel Cecil the chairman stated that with regard to the extension of the Strand frontage of the hotel, it had been considered desirable to acquire possession of the houses fronting that thoroughfare. Parliamentary powers had been obtained for the purpose, terms had been settled with the occupiers, and the demolition of the premises had been commenced. The London County Council would at the proper time contribute £30,000 towards the improvement of the Strand frontage, which would be set back some 25ft.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

ARCHITECTURAL ASSOCIATION.—The Annual Conversazione of the Association will be held at the Matinée Theatre (St. George's Hall), Langham Place, W., on Friday, the 26th inst. There will be a reception by the President from 8 to 8.45 p.m. A musical play, specially written for the occasion by Mr. F. D. Clapham, with music composed by Mr. Leonard Butler, entitled "The Broken Contract, or an Egyptian Enigma," will be performed at 8.45 p.m.

BURY (LANCS) MASTER BUILDERS' ASSOCIATION.—The annual dinner and meeting in connection with the Bury and District Master Builders' Association were held at the Grey Mare Hotel on Wednesday week. In the unavoidable absence of the president, Mr. James Byrom, Mr. J. H. Haworth (Ramsbottom) took the chair. The following were elected officers for the ensuing year:—President, Mr. James Byrom; vice-presidents, Messrs. J. Ramsden (Bury) and J. H. Haworth (Ramsbottom); treasurer, Mr. R. Smith; secretary, Mr. J. H. Thompson; auditors, Messrs. J. E. Tinline and J. Inman, jun.; committee (which previously consisted of seven members, but was now increased to ten), Messrs. J. Kay, jun., B. Holt, J. Hamer, S. Clough, J. E. Tinline, J. Bently, J. Castle (Ramsbottom), C. Dennis, R. Hall, and R. Ratledge. The following representatives were elected to the Lancashire Federation of Building Trade Employers:—Executive, Mr. J. H. Thompson; general committee, Messrs. J. E. Tinline and J. Ramsden. Five new members were elected from Bury and district. The business meeting was followed by a convivial gathering.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—The following is the syllabus for the ensuing session. The meetings, which are held on Mondays, will commence at 7.30 p.m.:—November 15, Address by the President, George Corson; Distribution of Prizes, Smoking Concert. November 29, "Stained Glass—Medieval and Modern: its History and Varied Processes," by Stephen Adam. December 13, "Some Byzantine Churches in Greece," by S. D. Kitson, M.A. January 10, 1898, Dinner. January 24, "Ornamental Hand-wrought Metal Work," by Nelson Dawson. February 8, "Early Renaissance Sculpture in Tuscany," by W. H. Thorp, F.R.I.B.A. February 22, Discussion Evening. March 8, Exhibition of Institute Drawings, Nomination of Officers. March 22, Election of Officers, Annual Report.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—The following is the programme for the session, which, as mentioned elsewhere, was inaugurated on Monday evening by the President's opening address:—Nov. 15, "Notes on Renaissance Architecture in Malta, with Special Reference to the Buildings of the Order of St. John," by A. S. Flower, M.A., F.S.A.; Nov. 29, business meeting; Dec. 13, "Brickwork Tests: Report on the Third Series of Experiments," by members of the Science Standing Committee; Jan. 17, 1898, award of prizes and studentships, preceded by business meeting; Jan. 24, President's address to students, presentation of prizes; Feb. 7, "The Housing of the Drama," by E. O. Sachs; Feb. 21, "The Medieval Campanile at Rome," by J. Tavenor Perry; March 7, business, including election of Royal Gold Medallist; March 21, "The Heraldry of Antiquity," by G. H. Birch, F.S.A., and "Heraldic Drawing," by J. D. Crace; April 4, "Artistic Copyright," by G. Harmand, Avocat à la Cour d'Appel, Paris; April 18, "Domestic Architecture in the United States," by A. N. Paterson, M.A.; May 2, annual general meeting; May 16, "The Libraries of the Middle Ages," by T. G. Jackson, R.A.; June 6, business, annual elections; June 20, presentation of the Royal Gold Medal, address by the President. The meetings are held on Monday evenings at 8 p.m.

At the diocesan conference held at Truro on Saturday the bishop referred to the completion of the cathedral, which, he said, would be carried out by the rank and file of Cornwall, and not by the aid of cheques. They proposed to finish the nave for the sake of the cathedral itself, and the west front as a memorial. In round figures £25,000 had been subscribed from all sources, and the estimated cost of the nave was £25,000, and of the west front £10,000.

Our Illustrations.

THE PASSMORE EDWARDS CONVALESCENT HOME FOR FRIENDLY SOCIETIES, HERNE BAY.

IN view of the limited accommodation at the convalescent home at Dover (which cannot be extended), Mr. J. Passmore Edwards has generously undertaken to erect a new home for the registered friendly societies. The trustees have succeeded in securing on very favourable terms an excellent site of above seven acres in extent on the Belting Estate at Herne Bay, and plans have been prepared by Mr. Alfred Saxon Snell, architect. The foundation-stone is to be laid by Mr. Edwards to-morrow, November 6th. The building is to be three stories in height, and will contain accommodation for 50 male patients. On the ground floor the wide front entrance porch leads to a small hall with a fireplace, and thence to the main staircase, which will be top-lighted. A corridor branches to the right and left of the entrance hall leading respectively to the patients' day-rooms and the administrative offices. The day accommodation comprises a large general sitting and smoking-room, with S. and S.E. aspects, and overlooking the gardens in the rear. In front of this room is a smaller quiet reading-room and library, with a large circular bay overlooking the front garden. The dormitory on this floor is for cripples, or others whose infirmities render ascending a staircase difficult. The large lavatory will be fitted with wash-hand basins and patients' lockers, &c. A bath-room is also provided on this floor. Left of the entrance hall are two rooms for the master and matron, and beyond these a large kitchen, stores, &c., and a service staircase. The dining-hall is a large room, 38ft. by 21ft., lighted by end bays and windows in the sides. A platform will be provided at one end, so that the room can be used for concerts and other entertainments. On the first floor are five dormitories, respectively for 10, 8, 6, and two for 4 beds each. The officers' and servants' bedrooms, linen rooms, &c., are placed over the kitchen block. On the second floor, and partly in the roof, are three dormitories for three beds each, one for four beds and one for one bed. All the dormitories allow nearly 900c.ft. for each patient. It is anticipated that in due course more accommodation may be required, and provision will be made so that any addition will not materially interfere with the present building. The external facings will be of Canterbury red brick, relieved with Monk's Park Bath stone dressings, &c.; Broseley red tiles will cover the roof. The walls internally will be plastered; but to all day-rooms and corridors there will be a cement dado. The dining-hall will have a tile or glazed brick dado

all round. The ground-floor corridors, hall, and verandahs will be paved with encaustic tiles. It has been sought in the elevation of the building, no less than in the grouping of the rooms, to avoid the idea of an "institution" as opposed to a "home." The architect's estimate of the cost of the building, including fencing and draining the land, is £6,000.

ADDITIONS TO THE SAVOY HOTEL.

THE additions to the Savoy Hotel illustrated herewith, from the drawing exhibited at the Royal Academy last summer, have been constructed with steel stanchions, girders, and braces filled in with coke-breeze concrete to form the walls and floors, the walls towards the courtyard being cased with terracotta. The work has been carried out by Mr. George Holloway, from the designs of Mr. T. E. Colcutt, architect.

BUNGALOWS, HERNE BAY.

THE bungalows illustrated in this issue are for erection on the East Cliff, Herne Bay, from the designs of Messrs. J. T. Wimperis and Arber. One, for Mr. George Adney Payne, is now nearly completed, with stabling and outbuildings. The drawings, which we reproduce, were shown at the Royal Academy this season. In execution the plans have been diversified, and in all a picturesque treatment has been aimed at.

MEFFAN INSTITUTE, FORFAR.

THIS drawing, which we give to-day, is from the Royal Academy. It shows the design submitted by Mr. T. Martin Cappon, architect, Dundee, in the late limited competition. It combines a small lending and reference library, reading-room, and librarian's room on ground-floor, with small lecture-hall and museum room on first floor; caretaker's home in attics, and heating chamber, &c., in basement. The built-up and contracted nature of the site presented difficulties as to lighting, which were not easily overcome, keeping in view that the building had to be so designed "that it might be easily supervised by an attendant." The elevation indicates an effort to give such a building character, and break away from the monotony and regularity of street fronts, so common in the small towns of Scotland.

ST. CUTHBERT'S PARISH HALL, DARLINGTON.

THIS parochial hall, of which we give a view and plan, needs but little description. The platform is so contrived that it can be converted into a second room for classes or the use of the vicar. Messrs. Clark and Moscrop are the architects.

NEW TOWN HALL, STANHOPE.

THIS hall has cloak rooms at the entrance end for ladies and gentlemen, and a retiring-room as well as an office at the stage end of the building, where there is also a second entrance. The gallery over the main portals gives increased seating accommodation. The hall occupies a very picturesque site, and it is treated in a Renaissance style. Messrs. Clark and Moscrop are the architects.

PRESBYTERIAN CHURCH, HANDSWORTH.

A COMPETITION was lately held for these new buildings, which, besides the chapel, include a large lecture-hall and a series of classrooms. The choir, as shown by the plan here given, is accommodated to the rear of the rostrum in a sort of apse, the organ being located to the back of the apse. The seats radiate in auditorium fashion, and the entrances are at the tower end of the building. The authors of this design (Messrs. Ingall and Son, architects), have endeavoured to depart from the type of Gothic more commonly used in this class of church building.

LOGGIA OF S. ANDREA, ANAGNI, ITALY.

ANAGNI, picturesquely situated on the side of the hills, enjoys a magnificent view in every direction. Its streets are rich in architectural remains, reminding one of its former splendour and importance. Griffins, lions, outside staircases, trefoiled windows, great arched doorways, and open loggias abound in this town, where many Popes resided. The cathedral is one of the most interesting buildings in this part of Italy. The spirited drawing by Mr. W. Campbell of the Loggia of S. Andrea, one of the fragments above referred to, forms one of the illustrations which we give in this week's number. We are indebted to the *American Architect* for the plate from which the sketch is given.

Over £16,000 has been raised towards the erection of a technical college at Wigan.

COMPETITIONS.

BIRMINGHAM.—At the last meeting of the City Council the recommendation of the Lunatic Asylums Committee that the plans for the proposed new asylum at Holly Moor, Northfield, be intrusted to Messrs. Martin and Chamberlain, architects, Colmore-row, was, after a somewhat heated discussion, negative and referred back to the committee, with instructions that invitations should be issued to a limited number of architects to compete for the same. The Asylums Committee have since met and selected six firms, to whom invitations have been sent out, at the same time intimating that instead of offering the usual premiums for success, the committee had decided that each selected competitor should be awarded 100 guineas for the trouble of preparing the plans. The plans will be adjudicated upon by the "two medical superintendents and the City surveyor." The *Birmingham Gazette* states that the firms who have been invited to send in competitive plans are:—Messrs. Martin and Chamberlain, 106, Colmore-row; Messrs. Cossins, Peacock, and Bewlay, 83, Colmore-row; Messrs. Mansell and Mansell, Whitehall Chambers, Colmore-row; Mr. Frank B. Osborn, 13, Bennett's Hill; Messrs. Cross, Brookes, and Nichols, Union Chambers, Temple-row; Messrs. Ingall and Son, 3, Temple-row West; all of Birmingham.

STOCK PRIZE.—The council of the Society of Arts, acting on the recommendation of the Department of Science and Art, have awarded the prize offered by the Society, under the Henry Stock Trust, for competition among students of the Schools of Art in the United Kingdom, for a design for architectural decoration, to Alfred Cumber, of New Cross School of Art, for his design for the decoration of a Turkish Bath. Mr. Cumber's design, for which a silver medal was awarded in the National Competition, consists of five drawings:—(1) Plan of the whole, (2) elevation of a complete bay, (3) sheets of details. The prize consists of the Society's gold medal or a sum of £20.

CHIPS.

Lady Truscott, widow of Sir Francis Truscott, Lord Mayor of London, has just presented stained glass to Truro Cathedral, filling the whole of the great window of the south-east transept in the choir. The window contains scenes from the earthly life and ministry of Our Lord. The cost has been upwards of £900.

The ceremony of turning on the electric light in Cambuslang was performed on Friday night by the chairman of the local gas company. The installation was fitted up by Messrs. Hunter and Jack, Glasgow, and the power is supplied from Cambuslang Gas Works. The engine is 29.5 H.P., and is driven at a speed of 250 revolutions per minute, the dynamo being capable of giving 1,100 volts; but it will only be run at present to give 700 volts.

On Tuesday week, the parish church of St. Mary, Breamore, was reopened by the Bishop of Winchester, after extensive restoration. At the same time the bishop consecrated an addition to the churchyard, and dedicated a new organ placed in the church by the Stanford family. The walls of the church have been restored, the old ceiling removed, and the old oak rafters in the roof exposed. New oak seats, together with oak pulpit and reading-desk, lamps for lighting, and heating apparatus have been provided. The cost of the restoration has been defrayed by Lady Hulse, and the work has been carried out by the men on the Breamore Estate, under the superintendence of Mr. Stanford.

Two memorial windows have been erected in St. Mary's Church, Carlton. The subjects are the gifts being presented by the Wise Men at Bethlehem, and the three Marys at the Holy Sepulchre.

The Norwich board of guardians have leased from the corporation of that city the Old Museum (vacated by the opening of the Castle as a museum), and have let their old board-room offices and workshops for a term of 200 years to the Technical Schools Committee.

A tablet in memory of the late Rev. Chancellor James Raine, LL.D. (1830-96) was unveiled in the north side of the choir of York Minster by the Archbishop last week. The memorial consists of a brass tablet, upon which is a Latin inscription. The brass is framed in Purbeck marble, with tracery head, and is surmounted by the sacred monogram, "I. H. S." The tablet was designed by Messrs. Bodley and Garner, architects to the Dean and Chapter, and executed by Messrs. Farmer and Brindley, sculptors, London, having been fixed on the wall by the minister staff, under the direction of Mr. R. C. Green, clerk of works.

LEGAL INTELLIGENCE.

THE ACTION AGAINST THE ST. PANCRAS GUARDIANS.—The case of "Drew-Bear and Co. v. the Guardians of the Poor of St. Pancras," was mentioned to Lords Justices A. L. Smith, Rigby, and Henn Collins in the Court of Appeal on the 1st inst.—Mr. R. M. Bray, on behalf of the plaintiffs, said that Mr. Justice Ridley had fixed to take the case on Jan. 11 next, but had since written and expressed an opinion that it was exceedingly doubtful if he could take it, having regard to his other engagements.—Mr. English Harrison, on behalf of the guardians, objected to his learned friend reading that letter to their Lordships, as it had not been communicated to his clients. Mr. Justice Ridley, he said, had written on Oct. 26 last a letter to both sides, which he desired his learned friend to communicate to their Lordships.—Mr. Bray said that he would read the letter, which was to the effect that, owing to business engagements, he (Mr. Justice Ridley) could not take the case on Jan. 11, or at any other time.—Lord Justice A. L. Smith: What do you want?—Mr. Bray: I ask your Lordships to say that the case shall be tried by Mr. Justice Ridley.—Lord Justice A. L. Smith said that he had already had two interviews as to the matter in his private room, and he felt that if a spirit of antagonism were adopted, the litigation would never come to an end.—Mr. English Harrison said that the case lasted 22 days before Mr. Justice Ridley. The question which remained to be decided was the mere assessment of damages, which had been allowed to stand over for further investigation. Out of 29 witnesses called, 26 or 27 were called in the case against the architects. Mr. Justice Ridley had said when they went before him at the beginning of the Long Vacation that he could not take the case this side of Christmas. The guardians wished to get the case disposed of, and he (Mr. Harrison) suggested that they should go before another Official Referee. His learned friend, Mr. Bray, would not consent to that, and pressed the case on. Then Mr. Justice Ridley said that he could not possibly take the case before Jan. 11. On Oct. 28 they received an intimation from Mr. Justice Ridley saying that he could not take the case, owing to public business.—Lord Justice A. L. Smith: Saying he could not take the case before January 11?—Mr. Harrison: No, nor at any other time. What has passed between Mr. Justice Ridley and my learned friend I do not know.—Lord Justice A. L. Smith: I think you may be informed of it when you read the letter.—Mr. Harrison said that no definite arrangements seemed to be able to be made. Mr. Justice Ridley said that he could not take the case on January 11, or at any other time. They all knew the pressure of business in the Queen's Bench Division, and he (Mr. Harrison) could not see that any injustice would be done by asking that the case should go before another Official Referee. Mr. Justice Ridley had said that he did not wish to take the case at all. He had also said that it was only under great pressure that he agreed to have his name put in the Order in the first instance. They had taken steps to get an early appointment—before Christmas, if possible—and to keep them tied up in that manner was not, he submitted, fair to the parties.—Lord Justice A. L. Smith said that he and his learned brothers were entirely of opinion that it was a case which ought to go back to Mr. Justice Ridley. He did not think that any other man could do in the time that which he could. Mr. Justice Ridley had gone at great length into the matter, and had come to the conclusion that the contract should be torn up and the case decided on *quantum meruit*. The Court of Appeal, however, had come to a different opinion. When Mr. Justice Ridley came to sit on the case he could soon find what the damages were to be. He (Lord Justice A. L. Smith) was convinced that if the matter went before another referee the whole of the 22 days already spent by Mr. Justice Ridley in trying the case would be thrown away, which would not be the case, however, if it again went before him. Probably his brother Ridley, after finishing the business of this circuit, and before going on another, could find time to take the case, and so be of great use to the parties. The learned Judge's time too would not be thrown away.

RATING OF WATERWORKS RESERVOIRS.—The principle upon which waterworks reservoirs should be rated was at issue at the Teddington Petty Sessions recently, when the Hampton District Council sued the Southwark and Vauxhall Water Company to recover £145 for rates alleged to be due on their Hampton reservoir. The contention of this and the other water companies at Hampton is that they are only obliged to pay rates upon one-fourth of the assessed values of their reservoirs, as they come within the exempting clause of the Public Health Act applying to land covered with water. Mr. Courthorpe Munro, for the plaintiffs, said that the reservoir was built up with high embankments and concrete walls and floor. He admitted that the practice for years had been to exact a one-fourth rate only on reservoirs, but urged that an old decision against the similar exemption of docks had never yet been applied to

the case. Mr. Ryde, for the defence, quoted a decision in the High Court that a filter-bed, even when built on arches, was "land covered with water," for this purpose. The Chairman said the Bench must decide the case from a common-sense point of view, and as a company that sold petroleum would be fully rated on its iron tanks, so should the water company be on its concrete tanks. A case for appeal was granted.

IMPORTANT TO LONDON ARCHITECTS.—A Tribunal of Appeal sat at the London Surveyors' Institution on Friday for the purpose of hearing and adjudicating upon an appeal brought under the London Building Act by Mr. H. F. Kite, of Saxonholme, Victoria-avenue, Westgate-on-Sea, against the London County Council. Mr. H. F. Rawlinson was counsel for the appellants, and Mr. Seager Berry appeared for the London County Council. In the case for the appellants it was shown that he proposed recently to erect a number of residential flats at Ronald's-row, at the rear of Highbury-terrace, Islington. The plans were submitted in due course, after approval by the Islington Vestry, to the London County Council, who eventually refused to sanction them on the ground that the height of the proposed buildings exceeded the height permitted by the Building Act, and on the ground that the frontage line was not in accordance with the terms of the Act. Mr. Seager Berry, at the outset, objected to the appeal being heard, inasmuch as the Council, and not the superintending architect, had refused the application, and that under the Act the decision of the Council could not be set aside. A long legal argument ensued, and eventually the Tribunal held that the decision of the Council was irrevocable. Permission was given to the appellants to withdraw, and this was accordingly done.

LONDON SCHOOL BOARD ARBITRATION AT POPLAR.—Mr. Under-Sheriff Burchell and a special jury, at Red Lion-square, Holborn, on Tuesday, heard the case of "Kelly v. the School Board for London," a claim for about £1,400 as compensation for the compulsory sale of the leasehold interest in Nos. 25, 27, 29, and 31, Dee-street, Poplar. The expert witnesses for the claimant were Mr. A. J. Sheffield and Mr. Frederick Ball, while Mr. Samuel Walker and Mr. Eason gave evidence for the Board. The jury returned a verdict for £1,075, or £5 below the formal offer of the Board, and, as a result, the claimant will have to pay his costs. The jury added an expression of approval of the way in which the Board conduct compensation cases.

RE SAMUEL ELLIOTT.—The bankrupt, formerly trading as a joinery and moulding manufacturer at Broad-street House, and Newbury, failed in March, 1895, and applied on Saturday for an order of discharge. The ranking liabilities were returned at £65,241, but proofs amounting to £117,531 have been made by creditors, and the assets which were valued at £8,553 are stated to have realised only £3,788. It appeared from the debtor's statement, that for about thirty-seven years prior to the date of the receiving order he traded at Newbury as a builder and contractor, but for the last eight years of the period as a joinery and moulding manufacturer. During the latter part of the trading he also had a London office at Broad-street House. During the six years immediately preceding the receiving order he was mainly engaged in developing and exploiting certain patented inventions for the annihilation of smoke and fumes. The bankrupt ascribed his failure to losses in respect of his patented inventions, and estimated that about three-fourths of his liabilities were incurred in connection therewith. The application was opposed by the Official Receiver on various grounds. Mr. Registrar Giffard said that 700 or 800 writs appeared to have been served upon the bankrupt in the space of five years, and about 500 executions levied during the same period. The natural inference was that the bankrupt was in a state of insolvency, and that he had gone on trading with a knowledge of his position, especially as he was in the habit of getting persons to accept bills, for which he paid them at the rate of 5s. each. Under all the circumstances the discharge would be suspended for four years from this date.

THE WESTMINSTER IMPROVEMENT.—At the Westminster Town-hall, on Wednesday, Mr. Troutbeck, Deputy High Bailiff, and a special jury heard the case of Mello's Trustees v. Her Majesty's Office of Works, a claim for £28,000 as compensation for the freehold interest in premises at the corner of Parliament-street and Great George-street, Westminster, occupied by the Aerated Bread Company. The property is let on a lease expiring in 1907 at £700 a year. Mr. Tewson, Mr. Bousfield, and Sir Whittaker Ellis were among the claimants' expert witnesses; while Mr. Robert Vigers, Mr. Galsworthy, and Mr. Horne gave evidence for the Crown. The jury returned a verdict for £26,000.

The unique 16th-century font cover at the parish church of Cockington, Devon, has just been restored by Messrs. Harry Hems and Sons, of Exeter.

STAINED GLASS.

ST. STEPHEN'S, COLEMAN STREET.—This classic church of Wren's is to have a "Jubilee" window, which is being unveiled with ceremony to-day. The subject is the "Stoning of Stephen," and a large figure of that saint occupies the centre portion of the window above the subject. It is the gift of Mr. John Farrand Clarke (who was a parishioner for 50 years) to commemorate the 60th year of the reign of Queen Victoria, and was designed and executed by Messrs. Heaton, Butler, and Bayne, of London.

CHIPS.

A statistical return lately published shows that in Germany many women take part in building operations. Among them are 309 masons, 2,000 workers in marble and slate, and 53 roofers.

Dr. Jonathan Hutchinson, F.R.S., a London physician, has expressed his desire of founding an Educational Museum in his native town of Selby, Yorkshire.

The following candidates have satisfied the Examiners in both parts of the Examination in Sanitary Science at Cambridge University:—Albert J. Adkins, Andrew Balfour, Philip L. Benson, William M. Brown, George H. Cock, William S. Cook, Robert Dick, Charles R. Elliott, Reginald A. Farrar, Sinclair Gillies, Charles H. Graham, Michael Kelly, Andrew J. Laird, Cecil F. Lilley, Alfred T. McConkey, Reginald J. Millard, Thomas B. Stedman, and James R. Watson.

Notices have been given for the construction of a light railway in the Isle of Sheppey. The proposed line is to run from Leydown, at the extremity of the island, through Eastchurch and Minster to Queenborough, where it will connect with the Sittingbourne and Sheerness branch of the London, Chatham, and Dover Railway.

A window has been fixed in Kelly Church, Devonshire, in commemoration of the Queen's Jubilee. The work has been executed by Messrs. Lavers and Westlake, of Bloomsbury. The window represents the three patron saints, St. George and the Dragon in the centre, and St. Andrew and St. Patrick on either side.

The Museum and Art Gallery Committee, of the Birmingham Corporation have accepted on behalf of the city a characteristic landscape, entitled, "Warwickshire," by Mr. C. T. Burt, and presented to the city by Mr. Mackenzie. The picture was last year in the collection of the Royal Society of Artists. The subject is the great and finely-wooded district of which Kenilworth Castle is the centre.

Barclay Free Church, Edinburgh, which has been closed for the last three months, has undergone extensive alterations and improvements. These comprise the repainting and decorating of the church, the introduction of an electric organ by Mr. E. Hope Jones, electric lighting of the church, the cushioning of all the pews, and other minor improvements. The architects for the alterations are Messrs. Sydney Mitchell and Wilson; the decorating is by Mr. James Clarke, George-street; the electrical works by the Waverley Electrical Company. The total cost of the various improvements has been over £2,000.

A new parish church is being erected at Flockburgh, North Lancashire, from the designs of Messrs. Austin and Paley, of Lancaster. It is Early English in style, and consists of a nave 62ft. by 23ft., having a massive western tower rising to a height of 53ft. only. There is also a chancel, and the north and south aisles are carried through from east to west. The fittings will be of pitch-pine, except the choir-stalls, which will be of oak.

The London and South-Western Railway have definitely decided to make a new line connecting Budleigh Salterton with Exmouth. This will give a circular route, bringing Sidmouth and Salterton closer to Exeter than at present, and will insure both places becoming much better known. During last week Mr. Galbraith, engineer of the London and South-Western, Mr. Drew, land agent to the company, and Mr. Chamber, agent to the Hon. Mark Rolle, were in the district, and the necessary steps for acquiring possession of the land and for obtaining powers to proceed with the construction of the line will be taken almost at once.

Mr. A. T. Nowell's canvas "The Expulsion of Adam and Eve," now in the Autumn Exhibition at Liverpool, has been purchased for the permanent collection at the Walker Art Gallery for £1,050.

The parish church of Langtoft, near Stamford, was reopened, after restoration, last week. The roof of the north aisle has been reconstructed, and the parapet and north wall repaired. The work has been executed by Mr. Cave, carpenter, &c., Langtoft; Mr. F. D. Cave, mason, Market Deeping; and Mr. J. Plowright, plumber, Market Deeping; under the superintendence of Mr. J. C. Traylen, architect, Stamford.

Correspondence.

A UNIVERSAL TEE-SQUARE.

To the Editor of the BUILDING NEWS.

SIR,—In your issue for Oct. 22 you illustrate a new folding tee-square. I would, therefore, like to draw your attention to a tee square I invented some twenty years ago. By means of this instrument and a pencil all the kinds of rectilinear drawing required in a draughtsman's office can be performed. As you will see from the illustration in the inclosed circular the instrument consists of a blade and headstock and a movable arm; the blade works in a semicircular slot in the headstock, whereby the blade can be set at any angle with the headstocks between, by means of the slot in the blade, the latter can move backwards and forwards transverse to the headstock, thus enabling the scale, by chords engraved on the blade, to be brought into arc whenever desired on the paper. By means of the arm that moves in a second slot in the blade any number of parallel lines may be drawn in any position on the paper. It would occupy too much space to describe the instrument in detail; but my object in drawing your attention to the instrument is this: I did not patent it, and I think that, perhaps, if attention were drawn to the instrument in your columns, perhaps some mathematical instrument-maker would feel interested in it to make such an article. If so I shall be pleased to send such a one, or anyone else, a descriptive circular concerning same, and, at the same time, I would say that I have no ulterior motive than obtaining publicity for the article, as I should be only too pleased to see it become an instrument in general use. A few reasons why the instrument was not exploited may appear necessary. When I first invented it the only suitable material I could obtain was copper. I had a model made in the metal, and, after showing it to Mr. John Livain, and the editor of your contemporary, the *Illustrated Carpenter and Builder*, who both expressed their approval of it, I submitted the instrument to Mr. Browning, optician, of the Strand, who promised to exploit it if I could find a more suitable material than copper (the weight of which militated against the easy handling of the instrument. After trying boxwood (which was too brittle), ebonite, zinc, &c., I gave up the matter as hopeless. Aluminium at that time was exceedingly high in price. Now, however, that that metal is cheaper, there could not be found a more suitable material for the construction of the invention, as aluminium is both light in weight, yet hard and durable. In 1880 (Sept. 11) the editor of the *Furniture Gazette* published an illustration and description of the instrument, and at the Health Exhibition I exhibited the model I had had constructed. Now, if any reader cares to take up the exploitation of the instrument, I shall be pleased to send him a descriptive circular and

full permission to do what he likes with the instrument without asking for any remuneration.—I am, &c.,
H. C. STANDAGE.
Erdington, Birmingham, Oct. 25.

ARCHITECTS' COMMISSIONS.

SIR,—I send you a copy of a letter that has been sent to Messrs. Norton and Co., Ltd., makers of chimneypieces, Corporation-street, Birmingham, and I should be glad if you could make some reference to it.—I am, &c.,
CHARLES E. BATEMAN, A.R.I.B.A.,
President.

Birmingham Architectural Association,
Queen's College, Paradise-street.

GENTLEMEN,—We have received copies of your illustrated catalogues, with slip attached, offering 5 per cent. special discount to architects.

We beg to point out that this amounts to the offer of an illicit commission, and that its acceptance is against the rules of the Royal Institute of British Architects and this Association, besides being contrary to the practice of respectable architects and a most reprehensible, and immoral proceeding.

We beg to say we are laying the matter before the councils of the Association and the Institute, and that we are sending copies of this letter to the professional papers.
CHARLES E. BATEMAN, A.R.I.B.A., President.
HERBERT R. LLOYD, A.R.I.B.A., Vice-President.

IRISH AND ENGLISH ARCHITECTS.

SIR,—With some knowledge of Ireland and the Irish, kindly allow me to endorse the remarks of "Goth" in your issue of the 8th ult. The architectural profession in Ireland is, as a whole, behind the times. There must be some offices where the leading assistant is an Irishman, but I did not hear of one. Englishmen, and Englishmen only, seem to be required as chief assistants. The reason is obvious. Not only are the latter more capable, but they get through much more work in a specified time. Irishmen are splendid orators. It is also interesting to note that it was left to an Englishman to start the new Association.

Although an Englishman is very acceptable in Ireland in a subordinate position, it seems nearly useless for him to take a place as principal. The fact that he is an Englishman tells against him. This feeling is not reciprocated in England.

"Wire-pulling" takes first place. One wonders where its equal is to be found, as also the barefaced manner in which it is done. The worst part of it is that it is nearly always done under the cloak of religion. "Protestant versus Catholic" is virtuals and drink to an Irishman.

The advertisement of 18 months ago is not the slander Mr. Butler would have us believe; I think he must have his eyes on the wrong office. Anyway, assistants cannot come to any harm by making careful inquiries before undertaking a somewhat expensive and tedious journey by land and sea.

One can but hope that "Goth's" letter may have the effect of stirring the architectural pro-

fession in Ireland to greater efforts—there is much room for improvement.—I am, &c.,
A GHOST THAT WALKED.

CHIPS.

The Duke of Devonshire is supporting a scheme for a light railway in East Sussex. The line will start from Berwick, and proceed by way of Alfriston and Littleington to Birling Gap, where a new watering-place will probably be developed.

A Perpendicular window in St. Michael's Church, Lichfield, has been filled with stained glass representing the Ascension. Mr. A. O. Hemmings, of London, was the artist.

The Montagu Institute and Working Men's Club in Hartford-road, Huntingdon, which has been erected by the Earl of Sandwich in commemoration of his year of office as Mayor has just been opened. It is faced with white bricks, and red quoins, labels, and cornice, with Broseley and blue ornamental tiles and red brick octagon chimneys. The length of the front is 72ft., and the depth is 76ft. The entrance hall, 17ft. by 15ft., has to the right and left reading-rooms, each 24ft. by 11ft., and opposite the entrance through another pair of doors is the lecture-hall, 46ft. by 24ft., and 17ft. high. All the floors throughout the building are laid with wood blocks. The work has been carried out by Mr. Page, of Buckden, under the personal supervision of Lord Sandwich.

In the parish church of St. Ives, Cornwall, the Archdeacon of Bodmin has dedicated a painted window and a reredos to the memory of the late Archdeacon Reginald R. Hobhouse, who was rector of the parish for half a century. The window has been carried out by Percy Bacon Bros., of Newman-street, London, from suggestions by the architect, Mr. G. H. Fellowes Prynne. The reredos is in carved oak, the work of Messrs. Powell, of Whitefriars, London.

When the inclusive contract just closed by the Dublin United Tramways Company and given to the British Thomson-Houston Co., Limited, for the entire equipment with electric traction of that portion of the tramway system now worked by horses is completed, Dublin will be in the position of possessing the largest tramway system operated electrically in the British Isles, covering, as it will, over 100 miles of track, on which will be operated over 200 motor-cars.

The flint casing on the south wall of the tower of the 14th-century parish church of Poyning, at the base of the Devil's Dyke, has just been renewed, under the direction of Messrs. Clayton and Monk, architects, of Brighton. Further repairs are urgently needed, and an appeal is being made for funds to enable the villagers to have them executed.

The Glasgow Tramways Sub-Committee on Electric Traction considered, on Monday, a number of offers for the erection of the entire plant, excepting only the cars, connected with the new Springburn electric tramways route. It was agreed to recommend the acceptance of the lowest offer, that of the Westinghouse Company, an American firm. The offer amounts to £19,657. All the tenders submitted were by American firms.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

SCOTCH MASON. (1. Livingston's or Allen's. 2. Lawrence Harvey's. Both of B. T. Batsford, 94, High Holborn, W.C.)

RECEIVED.—P. D. R.—W. F.—N. B.—H. S. P. and Co.—S. W. C.—E. P. J. and Son.—W. D.—W. A. B.

Intercommunication.

QUESTIONS.

[11831].—**Bright-Red Cement.**—I would be extremely obliged if you would let me know what parts are required to make a very bright-red cement for compo. work? Whether red oxide is the best permanent colouring, or brickdust of the same coloured bricks as what part of the front might be faced with, or Venetian red?—J. B.

[11832].—**Blue Prints.**—I shall be glad to know the method adopted in making blue prints and the materials required?—R. M.

[11833].—**Painting Galvanised Roofing.**—Some galvanised corrugated iron roofing has recently been erected to my order, and one friend advises me to coat the outside of it with boiled linseed oil, and, when it is set, to paint all with the coat of oxide of iron paint so as to preserve it. Another friend advises me to wait some time until the "salts of the galvanising" are out, and then to cover with two coats of oxide of iron paint without previously coating with boiled oil. Which method is recommended, or can you advise a better way of treating the roof?—MICH. ADVISED.

[11834].—**Section of Girder.**—Will someone kindly tell me how to calculate the required section of a rolled iron girder when the loads are neither in the centre nor equally distributed? Also, what is the safe working stress for steel?—L. H.

REPLIES.

[11833].—**Farm Building.**—I think "Modern Farm Buildings: their Construction and Arrangement," by A. D. Clarke, would give "Ostead" all the information he requires. The author is Silver Medallist of the Royal Agricultural Society for plans of farm buildings, and his work is recommended in the syllabus of the Surveyors' Institute examinations, published by B. T. Batsford, price 6s. net.—NUTTA.

[11830].—**Carvers' and Joiners' Workshops.**—One of the finest workshops in the provinces is Mr. Harry Hems', of Exeter. These are lighted east and west, and were designed by Mr. Medley Fulford, Exeter.

I believe I have seen all the principal workshops in England, and know of none better adapted to the business referred to.—EDWARD VALE, Weston-Super-Mare.

[11830].—**Carvers' and Carpenters' Workshops.**—My own premises, rightly or wrongly, have the goodly reputation for being the finest of their kind in the world. I erected them upon two acres of freehold land in 1881, from the designs of Mr. R. Medley-Fulford, F.R.I.B.A., then of this city, but now rector of St. Andrew's, Grenada, West Indies. The Ordnance Survey Map for 1891 shows the actual premises, 270ft. in length. They are built of local red brick, with Corsehill dressings. A perspective sketch of the first half that were erected (the other half was put up in 1884) will be found in the BUILDING NEWS issue for March 30, 1883. From my own observation, I believe the next best premises are those of Messrs. Poyer Bros., at Louvain, in Belgium. Although extensive, there is nothing architectural about them; but they have the advantage of being all on one floor (I have three floors), and have a splendid light. Messrs. Allin and Kitson, of New York, have undoubtedly the largest place for carvers and artistic joinery work in Christendom; but theirs are shops added to from time to time, and many of these additions are of necessity of a somewhat temporary kind. When one of the genial partners of this excellent Transatlantic firm was in Europe a few years ago, and ran down here purposely to see my place, after going over it, he turned, and, shaking my hand warmly, said emphatically: "Well, dear sir, I guess these studios take the cake on both sides. And I only say this after seeing the best of all of them!" Pullman's Palace Car Works at Pullman City, near Chicago, is the place where I have seen the most woodcarvers congregated together at one time. There were several hundred of them, working at a double row of continuous benches, the rear ones in a particularly poor light. They were all on piece-work, and I was astonished (I am speaking of the World's Fair year, 1893) at the low money most of them were able to earn; it was certainly less than the same class of men would be paid in England. If "Provincial Architect" will come down, and take lunch with me (any day convenient), it will afford myself and sons pleasure afterwards to give him the run of our studios. A north light is, of course, the right one.—HARRY HEMS, Exeter.

CHIPS.

At the meeting of the Liverpool Architectural Society, held on Monday evening, a paper was read by Mr. Huon A. Matear, F.R.I.B.A., on "The Birth and Development of Architecture."

At the instance of the London County Council, the owner of a house in South-grove, Highgate, was summoned to the local police-court on Monday to show cause why he should not pull down the top story of the rear portion of the house, including a defective timber framing next to the adjoining house. Evidence was given by Mr. Frederick Hammond, the district surveyor for North St. Pancras, that the premises were in a very dangerous state, and that the work was imperative. The Bench stated that an order would be made for the work to be done in 21 days.

A conference of delegates representing Metropolitan vestries and district boards was held on Monday at the Camberwell Vestry-hall, when a resolution was carried in favour of the Government acquiring the Crystal Palace as a permanent place of instruction and recreation. It was stated that the cost would be about three-quarters of a million, which, if spread over the Metropolis, would mean a rate of one-eighth of a penny in the pound.

The formal opening of the St. Patrick's Elementary Catholic Schools, Cornwall-road, Lambeth, took place on Monday. The total cost of the building and site has been £6,000, the greater part of which has already been defrayed. The schools, which will accommodate 230 boys and girls, are divided into two departments—an infant school and a junior mixed school. A small church dedicated to St. Patrick has also been provided.

A new lighthouse is being completed at Tod Head, near Kinneth, on the Kincardineshire coast. The building is 50ft. in height, and stands on a cliff of twice that altitude, and near by are dwellings for three families of the keepers. The builders are Messrs. Watson and Sons, Glasgow.

The new hospital, Bridport, is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

On Tuesday, Wednesday, and Thursday in last week, Mr. Joseph Abbott, Local Government Board arbitrator, sat in the Council Chamber, Waterford, to value the sites acquired for the abattoir, artisans' dwellings, &c., about to be erected by the corporation under the powers obtained by the Act of Parliament passed in 1896. Mr. M. J. Fleming, borough surveyor, and Mr. J. F. Knot, law adviser, stated the case for the corporation.

Next year's Navy Estimates will include some important proposals for the improvement and addition to the barracks occupied by the Portsmouth Division of the Royal Marine Light Infantry, the Lords of the Admiralty having sanctioned plans, to carry out which will cost £3,000. It is also proposed to connect the Naval Barracks and Gunnery School, Whale Island, to the mainland by a swing bridge, for which nearly £5,000 will be asked.

STATUES, MEMORIALS, &c.

DRURY LANE THEATRE.—The Lord Mayor unveiled on Monday afternoon the fountain, which has been erected in the Catherine-street wall of Drury Lane Theatre, as a memorial of the late Sir Augustus Harris. The fountain, which was designed by Mr. Sidney R. J. Smith, F.R.I.B.A., York Buildings, Adelphi, W.C., as hon. architect, is built of granite and red Mansfield stone, and has bronze enrichments. The base is of polished Norwegian granite and Sicilian marble. The water is delivered from a lion's head, and above the basin is a panel illustrative of dramatic art, having figures carrying masks. Above this panel rises a Classic pediment supported by two polished granite columns having drums at the base and musical instruments in bronze carved on them. Under the pediment, which has Tragedy and Comedy masks, and a central lyre, is a niche containing a bust of the late Sir Augustus Harris, modelled and worked in bronze by Mr. T. Brock, R.A., and having the name "Augustus Harris" inscribed underneath on a bronze panel. We illustrated the fountain in our issue of May 14 last.

A Local Government Board inquiry was held at Penzance on Tuesday week by Colonel A. C. Smith. The town council had applied for power to borrow £6,624 for purposes of street improvements, pleasure grounds, and the provision of a borough surveyor's house.

The new volunteer-drill hall at Eastgate, Barnsley, was formally opened by Colonel Stanhope, C.B., on Friday. The premises have been built at a cost of £4,000. They comprise on the street level a drill-hall 85ft. by 45ft., with a drill-shed of similar dimensions beneath it. An armoury, smoke-room, officers'-rooms, clothing-rooms, caretaker's premises, &c., are also provided. The architect is Mr. H. Crawshaw.

The ceilings and walls of St. Mary's Church, Birmingham, are being decorated by Messrs. Horton and Son, of Bristol-street, according to a scheme of colour prepared by Messrs. Bateman and Bateman, architects, based upon the Italian Renaissance of the 15th century, various tints being arranged upon a cream ground. Messrs. Jeffery and Son have executed the various structural works. The opening service, to be taken by the Bishop of Worcester, will be held on Saturday, November 21.

Before Mr. Justice Wright and Mr. Justice Kennedy on Saturday, an appeal was heard, "Baker v. Williams," from a conviction by Southport justices of a dairyman and cowkeeper for contravening a by-law of the Southport Corporation which provided that in cow-sheds in the borough there must be 800c.ft. of free air space for each animal. It was contended for the appellant that the by-law was *ultra vires* and invalid, but their lordships took an opposite view, and affirmed the conviction.

An appeal is being circulated among English Churchmen here for the erection of an Anglican cathedral for the diocese of Brisbane, Southern Queensland. A site has been secured, and designs have been prepared by Mr. J. L. Pearson, R.A., who considers that the first part of the cathedral (that being the choir and transepts, accommodating about twelve hundred worshippers) can be erected for about £33,000. Only about £3,000, however, has yet been raised, including £1,000 from the Society for Promoting Christian Knowledge.

The partnership hitherto subsisting between Louis Jacob and J. A. Brand, architects, Gresham-street, E.C., under the style of Jacob and Brand, has been dissolved. A similar announcement of dissolution of partnership appears in Tuesday's *Gazette* with reference to M. H. Agar and A. Musgrave, builders, of Sheffield.

Notices have been given of intention to apply for powers to construct light railways between the Metropolitan Railway Station, Finchley-road, Hampstead, and the adjoining suburbs of Finchley and Hendon by the Finchley District Electric Traction Company.

The London County Council discussed, on Tuesday, the request of the City Corporation for a grant of £16,620, towards the cost of widening Ludgate-hill near St. Martin's-court. As the Council had once before refused to entertain this application, on the ground that the improvement had already been made, objection was made to reopen the matter. Finally, however, the grant was agreed to, on the understanding that it was made under exceptional circumstances, and must be accepted as a final settlement of any outstanding claims.

The Lord Mayor and Sir Edward Poynter, the president of the Royal Academy, with Mr. Temple, the director of the Guildhall Art Gallery, viewed, at the Pantechnicon on Tuesday, the pictures which Mr. D. P. Sellar has offered to present to the Corporation of London as the nucleus of an art collection in the City. The result of their inspection will be made known to the Corporation, and to Mr. Sellar at an early opportunity.

WATER SUPPLY AND SANITARY MATTERS.

CASTLEFORD SERVICE RESERVOIR: SINGULAR FISSURE.—The district council of Castleford have received the report of Mr. Malcolm Paterson, M.Inst.C.E., on the state of their service tank on Red Hill, which is almost without precedent in this country. A huge fissure extends across the entire surface of the bottom, 2ft. to 5ft. in width, and 28ft. deep. This was laid bare some months ago, after the sudden disappearance of the contents of the tank when the concrete bottom was partly removed. The reservoir site is on the Permian formation, the strata consisting of magnesian limestone lying in a compact sand-bed almost indurated to rock. This rock yields the best moulder's sand, which has been excavated for many generations by mining in long galleries with supports and adit entrances. The workings extend for miles and have been proved to approach within a few feet of the reservoir, and probably extend below it on the side. By exposure to air and the infiltration of water, they have gradually crumbled and fissured, causing leakages from the tank, which in their turn have accelerated the waste and the subsidence, and have caused the ruin of the tank. An inspection of these workings was necessary, though attended by danger from loose rock in the roof. In Mr. Paterson's report a previous proposal to buttress the north side by a retaining wall, arched on plan, is set aside as a futile and hazardous operation. Instead of this, he proposes to construct a new reservoir holding 1,250,000 gallons on a new site on adjacent ground to the west of the present tank, which appears to be the only suitable site not honeycombed by the sand workings; but even here he considers that five or six borings, not less than 50ft., are indispensable to prove the ground. The present population of Castleford is 17,000, having increased from 6,271 in 1871. The cost of the new reservoir, if open, is estimated at £3,250, or if covered at £4,700. At the request of the council, Mr. Malcolm Paterson, C.E., has recently reported on the present condition and working of the main drainage system, including the pump-well and tank-sewer. After a detailed examination and certain tests, his conclusions are (a) that the stability of the works, which were constructed from his designs in 1877, is intact in all respects, the work being as good as when it left the contractor's hands; (b) that the permanent influx of subsoil water by leakage is insignificant, but that certain open lands are drained direct into the system; (c) that flushing of a systematic kind has not been used, although each manhole was designed as a flushing shaft, and that the whole of the main outfall and branch sewers, and parts of other sewers, are in urgent need of flushing; (d) that the storm water off streets and large yard surfaces should not be taken into the sewers, which were not designed to receive more than the storm water from roofs and small yards, &c. Besides temporary measures, such as cleansing the sewer from the accumulation of solids, Mr. Paterson recommends certain automatic flushing-tanks, self-acting flushes in the tank sewer, storm overflows, revolving screen, &c., at a cost of £1,200. This outlay, he considers, with proper management, will render the Castleford drainage system thoroughly efficient. The river Aire at Castleford is only 28½ft. above sea-level, and the town lies so low as to be subject to surface floods in certain places. Hence the existence of flat gradients and the need of constant flushing. Also, the sewage being pumped 45ft., renders it essential to keep out the subsoil water and the bulk of the storm water. Since the scheme was carried out, at a cost of about £30,000, Castleford has doubled its population, and is still increasing at a rapid rate.

GLASGOW.—An important extension of the Glasgow Sewage Purification Works was inaugurated on Friday by Lord Provost Richmond. The works, which are situated at Dalmarnock, in the east end of the city, were opened in May, 1894, and have consequently been nearly three years and a half in operation. For the site a sum of £35,461 was paid, and a further sum of £86,026 was spent on works and machinery, making a total of £121,488. As then in operation, there was a total daily flow of sewage into the works every twenty-four hours of between five and six million gallons, from which the solids were extracted, and the liquid rendered innocuous by chemical treatment and precipitation. Since then additional sewers have been connected with the works, bringing the aggregate daily inflow up to about ten million gallons. The extensions consist of eighteen precipitation tanks, built of brick, with concrete floors, each 100ft. by 40ft., with a water-holding depth of 7ft. These extensions were designed by Mr. A. B. McDonald, the city engineer, on the lines of the scheme originally carried out by the late Mr. Alsing, the first engineer of the works, but with improvements, and they bring up the total storage capacity from two to five million gallons. After the inauguration ceremony the company inspected a new land filter, through which the purified effluent finally passes before its exit into the river. They also saw in operation the plant for drying the sludge, recently

erected at a cost of over £2,000. Including cost of site and drying plant, the total expenditure on the works up to date amounts to £134,540.

CHIPS.

Colonel C. H. Luard, R.E., held an unopposed inquiry at Willenhall, on Friday, on behalf of the Local Government Board, at the Town Hall, with regard to an application by the district council for permission to borrow £2,129 for sewerage works, and £2,000 for cemetery purposes.

The City Commission of Sewers adopted an arrangement on Tuesday for acquiring the freehold of No. 97, Fleet-street, for £5,000, with a view to extending the widening now in progress on the south side of that thoroughfare from the Circus at Ludgate.

The celebrated French engraver, Charles Courty, died in Paris on Tuesday from an attack of paralysis. He was only forty-nine years of age. Among his most important works are the "Game of Cards," from Pieter de Hooch's painting; "The Condemned Convict," from Munkacsy's picture; "The Austrian Staff in the Presence of Marceau's Corpse," painted by Jean Paul Laurens; and "The Wife and Children of Holbein," engraved from the famous picture in the Balse Museum.

In connection with the reopening of the parish church of St. Martin's-in-the-Fields, after decoration and alterations, effected from Sir Arthur W. Blomfield's designs, by the proceeds of the Queen's Jubilee Procession, it is proposed to hold a Masonic Service on Sunday next, at half-past three o'clock.

It is proposed to place in Bristol Cathedral a reredos to cost £2,500, and a bishop's throne to cost £700, both designed by Mr. J. L. Pearson, R.A. The cost of the former will be met, it is suggested, by subscriptions raised as a memorial of Bishop Ellicott on severing his connections with Bristol, and that of the latter by personal friends in Stepney of Dr. Browne.

Before Mr. Justice Lawrance and a special jury, on Wednesday, Mr. James Orrock, the well-known landscape artist, sued the proprietor of the Café Monico for damages for injury sustained by him at the café, when the cork of a bottle of potash which was being opened for him by a barmaid flew out and struck him in the eye, inflicting injuries which had seriously interfered with the practice of his profession. He estimated his loss at £1,000. The jury ultimately awarded him £300.

The church of St. Lawrence, Tidmarsh, Berks, has been reopened, after having undergone a complete restoration, from Mr. Oldrid Scott's plans. The nave roof has been stripped and the old plaster done away with, new rafters substituted where defective, and the roof boarded. The tiles are replaced as far as possible, and the rest made good with old ones of a similar kind. The chalk chancel arch, which had several fissures, has been supported on the outside by two buttresses of stone and flint. The decayed wooden steeple is replaced by one of oak shingles, which bears the gridiron as a vane. The modern floor below the belfry floor has been removed, thus exposing to view the ancient oak framing of the turret.

The west entrance archway to the organ of Hazelbeach Church has just been occupied by a memorial screen. It is executed mainly in Hop-ton Wood stone and alabaster, terminated by a rich pediment of ornamental ironwork. The design was by Messrs. Forsyth and Maule, architects, and was executed by Mr. James Forsyth, of Finchley-road, Hampstead.

At the London County Sessions, on Wednesday, before Mr. Mc'Connell, Q.C., Hermann C. Halliday, 41, surveyor, was convicted of having obtained £11 5s. on false pretences from Mr. Joseph Burton, a builder. He had obtained the money as payment of rent in advance on behalf of Dr. Monte, of Kensington-gore, who had let Mr. Burton a house, and then appropriated it to himself. It was stated that the prisoner had been twice previously convicted of similar offences, and he was sentenced to 15 months' hard labour.

Mr. James Paton, Curator of the Glasgow Corporation Art Galleries, delivered to a large audience on Tuesday night in the galleries the opening address for the season on the contents of the galleries, his subject being "Italian Art—Introductory."

Mr. Thomas Quinn, Nationalist Member of Parliament for Kilkenny from 1886 till 1892, when he retired owing to ill health, died at his London residence in St. Alban's Mansions, Kensington, on Wednesday night. Born in 1838, he started early in life as a builder, and, coming to London, rapidly created an extensive and lucrative business.

At Tuesday's meeting of the Altrincham Urban District Council it was agreed, on the recommendation of the General Purposes committee, to advertise for competitive designs for new offices, the cost to be limited to £4,000.

Our Office Table.

The arrangements for the Mediæval and Modern Metal-Work Exhibition at the Royal Aquarium in April next are progressing favourably. The council of advice have adopted schemes for the workmen's competitions and competitive designs, both sections promising to be extremely interesting, especially the former, thanks mainly to the help of Mr. Lewis F. Day and Mr. Maurice B. Adams, who have very kindly and ably helped the Council with designs and suggestions. Particulars of both competitions will shortly appear. A very good Loan Exhibition is certain, and the applications for space—which should be addressed to the organiser, Mr. E. S. Shrubsole, at the Royal Aquarium, Westminster—are already numerous.

PROFESSOR GERALD BALDWIN BROWN delivered in the hall of Free St. Andrew's Church, Drumsheugh Gardens, Edinburgh, on Tuesday, the first of a course of twenty lectures on Italian Art, arranged for by the committee of the Edinburgh Social Union, and illustrated by lime-light pictures. Italian sculpture and painting, the lecturer said, was one phase of the art that from its subjects and tone had been called Christian. The expression of Christian ideas in art varied from age to age. In the earliest mosaic designs these ideas were treated with reserve, while in the middle ages that reserve gave place to an over-insistence on theological doctrines, and to an almost morbid delight in depicting the sufferings of saints or the terrors of the world to come. The didactic element in art became in this way too prominent. In the present day it was often denied that art could exercise any legitimate ethical influence. There was a certain truth in that doctrine; but in the crude form it took sometimes it was belied by the whole history of the arts. Sculpture and painting could, however, most effectively exercise their ethical influence by presenting pure and elevated types and actions that might be left to work an ennobling influence on the spectator. This truth was recognised in the later Middle Ages, though it was not the Italians who first discerned it, but the French. The sculpture on the French Gothic cathedrals presented types of purity and sweetness and heroism, and the work was all pervaded with a fine sense of beauty. In many of the qualities most admirable in the works of the early Italians they had been preceded by the sculptors of northern France nearly a century earlier. If we asked the reason why the Italians, beginning later, advanced so much further in art than the French, the answer would be found in the development among the former of individual genius. Without the action and reaction on each other of strong and original personalities, sculpture and painting never advanced to their highest forms.

A PROPOSAL for the widening of Southampton-row, between Theobald's-road and Holborn, will shortly be presented to the London County Council for adoption. The Improvements Committee report that their attention had recently been called to the fact that premises might shortly be in course of reconstruction at Southampton-row, and that, therefore, a favourable opportunity was presented for widening that thoroughfare. During negotiations with reference to the purchase of property for widening the southern end of the thoroughfare it had transpired that the Duke of Bedford was the freeholder of the whole block of property bounded by Southampton-row, Theobald's-road, Kingsgate-street, and Holborn, and that the leases of all the property, with the exception of one or two sites upon which rebuilding had already taken place, had not many years to run, in fact, most of them would expire in 1901, and they had been led to believe that the Duke would be quite prepared to negotiate for the sale to the Council of his freehold interest in the whole of that large block of property. The estimated net cost of the scheme, including the acquisition of the freehold and the two long leasehold interests in the entire block of property between Southampton-row and Kingsgate-street, was, after allowing for recoupment by sale of the surplus land, £149,500. The proposal would be to purchase the freehold and long leasehold interests in the first instance, and to allow the short leases to run out, the Council in the meantime receiving the rents.

The small playground between Drury-lane and Catherine-street, known as the Russell-court playground, and traditionally said to be the

churchyard indicated in Dickens's "Bleak House," will shortly be closed to the public. It has an area of 4,050ft., and has been much used by the children who live in the densely crowded neighbourhood. The Duke of Bedford, contemplating carrying out certain improvements in the district, including the formation of a new street across this playground, asked the London County Council to consent to the removal of the playground to another site. It was proposed on behalf of the Duke of Bedford that in exchange a piece of land 4,320ft. in area, and situated in Duke's-court, Drury-lane, should be set apart for a playground. In consideration of the exchange the Council consented to an application being made for a faculty for the ground in Russell-court, which is a disused burial-ground, being used as part of a new street. The faculty asked for has now been granted. It transpires, however, that the owner of the fee was the rector of St. Mary-le-Strand, and that the Council had only a short tenancy of the land in Duke's-court. As the Council, therefore, have nothing to convey, the question of substituting another playground has been dropped. The matter came before the Council on Tuesday, when Alderman Beachcroft called attention to the extraordinary circumstances; but although consideration of the report was adjourned, it seems that the Council are helpless.

At the last meeting of the City Court of Common Council a petition was presented by a number of leaseholders and occupiers in London-wall and Finsbury-circus with reference to the proposed improvement in those thoroughfares. Appended to the petition was a report by Mr. D. Watney and Mr. G. A. Wilkinson, in which these well-known surveyors remarked that it was stated that the total annual rents derived from the property was £3,486, and that if let as cleared ground it would produce approximately £20,000 a-year. From their survey they had come to the conclusion that the annual value of the property proposed to be dealt with was rather over £16,000, whereas, if cleared and the scheme carried out, the ground rents would come out at not more than £15,500. With regard to the scheme generally, they could not but feel that the London-wall and Blomfield-street shops were doomed on account of the necessity of widening those streets, but these shops should not all be demolished at one time; nor did they see any reason why the premises at the rear of these shops should be much interfered with in the rebuilding. The proposed new road was hardly the best method of developing that side of the estate, inasmuch as it would be useless as a thoroughfare, and consequently of no value for shop property. In their opinion there was no good reason for pulling down the houses in Finsbury-circus, as they were of a substantial character, with a good life of 30 to 40 years before them. In conclusion, they had no hesitation in condemning a scheme for the clearance of the houses and premises standing on 2½ acres in such a busy part of the City of London. The petition was referred to the Bridge House Estates Committee for consideration.

The work of restoring Maclise's two frescoes in the Royal Gallery of the Palace of Westminster, upon which, at the request of the First Commissioner of Works, Prof. A. H. Church, F.R.S., and his assistants have been engaged for some time, has been completed this week, the result of the special treatment, so far as can be at present ascertained, being regarded as of a most satisfactory character. The two frescoes in question—"The Meeting of Wellington and Blucher at Waterloo," and "The Death of Nelson"—have been thoroughly dusted and cleaned with bread before being submitted to the restoring process, which has been carried out successfully in regard to the paintings by G. R. Herbert, R.A., Sir John Tenniel, W. Dyce, R.A., and W. C. Horsley, R.A., in other parts of the building. Mr. Herbert's fresco was so hopelessly decayed, owing to the influence of the London atmosphere, that the professor had to content himself with merely washing the surface with distilled water, whereas in the case of others, notably Mr. Dyce's "Baptism of Ethelbert," the result of the treatment has been not only to render it once more visible from the floor of the Peers' Chamber, but to largely restore it to its original colour effect.

The parish-church of Oldbury-upon-Severn was destroyed by fire on Sunday morning. Before seven o'clock the whole of the walls had fallen in, the roof and the interior of the tower, together

with the bell, having fallen some time previously. With the exception of the two porches the building is an entire wreck, the walls of the tower being completely split. The one bell was melted, and the freestone on each arcading is broken and cracked. The huge and ancient font, which was of one stone, is also destroyed. The registers, which were kept in the vestry beneath the tower in a safe, were all consumed, the safe, when it was possible to reach it, being found to be red hot and cracked. The damage sustained is estimated to be from £3,000 to £4,000. The church, situated on an eminence a short distance from the Severn, occupied the site of a Roman camp, and was a stone building of the Early English style. There was originally a spire, which was blown down in 1702. In 1885 and 1886 the church was restored, and the south aisle and porch rebuilt.

In the course of the past summer, in consequence of a sifting of certain traditions found among the residents on the Ruthin side of the Hirathog Mountains, Mr. R. O. Jones, of Ruthin, has carried out a search over that almost uninhabited region for archaeological remains, and has succeeded in finding nine stone circles that were hitherto unknown. Some of the circles are perfect, and others imperfect, the latter having probably been deprived of stone for building purposes. The outside of each circle is composed of large stones, and, in those circles that have not been tampered with, the outer stones are twelve in number. The diameter of the circle ranges from 18ft. to 48ft. Mr. Jones has been in communication with Prof. Rhys, of Oxford, who holds that the remains are far more ancient than the Ogam inscribed stone found in the same region, and now at Pool Park, Ruthin. Mr. J. Romilly Allen, F.S.A.Scot., regards the circles as probably Pagan. They are sepulchral, and often have a cist in the centre, containing an urn or calcined bones.

The roof over Robinson's opera-house, in Cincinnati, fell in during a performance a few days ago, and three persons in the audience were killed and many injured. Mr. Rapp, the president of the Cincinnati Chapter of the American Institute of Architects, who inspected the ruins immediately afterwards, has pointed out what was unquestionably the cause of the accident, by showing that the middle roof-truss, which was of pine, 80ft. in span, had given way, partly through the shrinkage which always unfavourably affects wooden trusses put together with iron bolts, and partly, as it appeared, through rotting at the joints. The roof has been in place more than 25 years, apparently without attention, and it is hardly surprising that it should be in bad condition; and the middle truss, which is most exposed to the influence of the warm and moist air from the auditorium, usually, in such cases, gives way first.

The union carpenters in New York threaten a new and extensive strike, on account of the use in the city of wood finish made in the West, particularly in Cincinnati and St. Louis. The cities, being near the hardwood forests of Tennessee, Kentucky, and Missouri, are favourably situated for selecting and working such material, and for many years, mouldings, doors, panel work, and flooring, in oak, ash, and cherry, have been extensively made there, generally from architects' detail drawings, and shipped to the Eastern cities.

The new annual Directory of the Science and Art Department, just published, announces several important changes, one of these being that building grants for new schools, hitherto made to local authorities in many instances, are to be discontinued, except in the case of applications which have already been entertained, and the income derived from instruction in science or art must be applied for purposes approved by the Department.

In the little parish church of Wonastow, two miles from Monmouth, the Bishop of Landaff has dedicated a new window, a three-light one, by Mr. C. E. Kempe. It represents the Incarnation, the centre light showing the Blessed Virgin and Holy Infant, the side lights representing the Magi and Shepherds.

At a special meeting of the Leigh and Astley Joint Burial Board on Thursday in last week, it was unanimously decided to approve of the plans and estimates for a new cemetery in Manchester-road, Leigh, adjoining the old cemetery, and to obtain the sanction of the vestries to the borrowing of £13,068 for that purpose. The new cemetery will contain over 14 acres, and provide 14,000 grave spaces. Almost all the spaces in the old cemetery, which was opened 41 years ago, are taken up.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Surveyors' Institution. Opening Address by the President, Christopher Oakley. 8 p.m.
Bristol Society of Architects. "Medieval Bristol," by Col. J. R. Bramble. 8 p.m.

TUESDAY.—Institution of Civil Engineers. "The Manchester Ship Canal," by Sir E. Leader Williams; with supplemental papers by Whately Elliot and W. O. E. Meade-King. 8 p.m.

CHIPS.

The erection of a cottage hospital at Thetford as a memorial of her Majesty's Diamond Jubilee, is being rapidly proceeded with by Messrs. Boughton and Son, builders, of that town, from the designs of Mr. Herbert J. Green, architect and surveyor, of Norwich.

Torquay Town Council are about to proceed with the erection of a refuse destructor, which was approved twelve months ago. Tenders are invited for the preparatory buildings.

At a special meeting of the Hastings Corporation it was resolved to carry out a scheme to obtain a supply of water for the borough from Brede Valley, where experiments have been made with the result that it is believed an abundant quantity of water of the purest quality can be drawn. The total cost of the scheme is estimated at £131,873.

A land surveyor, named William Henry Pettit, living at 64, Argyle-street, Hull, committed suicide on Wednesday evening in last week by shooting himself with a revolver. He was 64 years of age, and has been for some years unable to follow his profession.

Steps are being taken for proceeding forthwith with the erection of the Diamond Jubilee Tower on Castle Hill, Huddersfield, in accordance with the designs of Mr. Isaac Jones, of Herne Hill, S.E., selected in the recent competition.

The proposal of the Manchester Corporation to expend a quarter of a million on the construction of a sewage culvert to the estuary of the Mersey has been rejected by the ratepayers by 49,069 votes to 20,528.

At Nursling, Hants, a church room, erected by Messrs. Golding, of Romsey, was opened last week. It is of red brick, measuring 45ft. by 16ft., and is seated for 140 persons.

At New Pelton, Halifax, the Liberal Club of the Western division of Ovendon Ward opened their new premises on Saturday. The building is of a plain character, and the outer walls are of brick. On the ground-floor is the billiard-room, allowing space for two tables, and on the first floor is the assembly-room, furnishing accommodation for four hundred persons. The total cost will be £600. The architect is Mr. Medley Hall, of Northgate, Halifax.

A once celebrated sculptor, Professor Luigi Amici, died on Sunday in Rome. He was born in 1813 at Jesi, and being early left an orphan, was received into the charitable foundation of San Michele by Cardinal Tosti. Amici was educated as an artist, and soon made brilliant progress, commissions flowing in upon him when he left the institution. His best-known work is the fine monument to Gregory XVI. in St. Peter's, which was erected to the memory of that Pope by the Cardinals whom he had created. After over eighty years of varying fortunes, the sculptor returned to die in the asylum where he had been educated, in the department reserved for poor old men.

The dispute between Langholm Burgh Commissioners and Mr. M. Knox, Langholm, contractor for the repair of Langholm Suspension Bridge, has now gone to the law courts for settlement. Mr. Knox has been served with a summons in an action against him in Dumfries Sheriff Court by the commissioners to compel him to proceed with the repair of the bridge and use such wood as was specified for. The contractor has commenced a counter-claim against the commissioners. The dispute arose from the inspector of work condemning the wood being used by the contractor.

The temporary injunction, restraining the Commissioners for the Harrisburg Capitol from carrying out their proposition to act themselves as judges in a new competition has been dissolved by the County Court of Common Pleas for Pennsylvania; but by mutual consent the question is to be carried up on appeal to the higher courts.

A town-hall and premises in St. James's-square, Bristol, rebuilt from plans by Mr. J. Young, of that city, will be opened on Tuesday next.

The last of the summer excursions of the Northern Architectural Association was held on Saturday afternoon, when a party of 15 members were conducted by Mr. J. W. Taylor over the new Y.M.C.A. buildings, and the alterations to Messrs. Bainbridge's premises. Mr. J. T. Cackett conducted the members over the recent Art Gallery alterations.

LIST OF COMPETITIONS OPEN.

Byfleet—Village Hall and Workmen's Club (£1,500 limit)	25 Guineas	F. C. Stoop, Hon. Sec., Albany House, Byfleet, Surrey	Nov. 13
Southend—St. Alban's District Church	No premium offered; no Assessor named	Rev. E. C. Kimber, Avenue-terrace, Southend-on-Sea	20
Edinburgh—Heating and Ventilating City Fever Hospital	Premium not stated	City Superintendent of Works, Edinburgh	25

Heywood—Coke Elevator	Gas Committee	J. H. Caldwell, Town Clerk, Municipal Buildings, Heywood	16
Burnley—Electric-Lighting Cables	Corporation	W. R. Wright, Borough Electrical Engineer, Burnley	17
Leeds—Heating Fever Hospital, Manston	Corporation	Town Clerk, Town Hall, Leeds	18
Blackpool—Electric Traction	Corporation	R. C. Quinn, Borough Electrical Engineer, Blackpool	22
Belen Para, Brazil—Water-supply Works	Government	Brazilian Consulate, London	30
Southampton—Pontoon	Harbour Board	The Mayor, Surveyor, 4, Portland-street, Southampton	Dec. 6
Craiova—Waterworks	Town Council	E. Cooper, Engineer, 9A, Portland-street, Southampton	—
Ostend—Harbour Works (estimated cost, £496,792)	Official	The Secretary, Craiova, Roumania	7
St. Gilles-lez-Bruxelles—Gasworks	Council	Provincial Government, Bruges	14
Brazil—Railway from Novo Hamburgo to Caxias	Government	The Secretary, 504, Chaussée de Mons, Anderlecht, Brussels	31
Pernambuco—Port Works	Government	Central Directorate, Public Works, Porto Alegre	31
Madras—Utilisation of Water of Periyar Lake	Government	Brazilian Ministry of Public Works, Rio de Janeiro	(1898) Feb. 29
Flushing—Two Sluice Gates	Official	Chief Engineer for Irrigation, Madras	(1898) July 1
—	—	Provincial Government, Middelburg, Holland	—

FENCING AND WALLS.

Stockbridge—Dwarf Concrete Wall (600ft. run)	Rural District Council	W. J. Ayles, District Surveyor, Brompton, Stockbridge	Nov. 9
Ravensthorpe—New Wall	Urban District Council	J. Watts, Church-street, Dewsbury	10
Greenwich—Dwarf Wall and Iron Fencing, South-street	District Board of Works	J. Spencer, Clerk, 141, Greenwich-road, S.E.	10
West Hartlepool—Iron Fencing, Burn Valley (1,650 yards run)	Corporation	J. W. Brown, Borough Engineer, West Hartlepool	11
Lancaster—Boundary Wall, Springfield Park	Streets Committee	T. C. Hughes, Town Clerk, Lancaster	13
Keswick—122 yards of Stone Wall, 4ft. 6in. high	—	Owner, Red House, Keswick	—

FURNITURE AND FITTINGS.

London—Supply for Metropolitan Police Service (Three Years)	Official	The Receiver, New Scotland Yard, S.W.	Nov. 17
Moulford—Asylum	Town Council	The Steward, Moulford Asylum, Wallingford, Berks.	17
Crewe—Technical Institute	—	J. A. Jenkins, Secretary, Municipal Offices, Crewe	—

PAINTING.

Porthcawl—East Convalescent Home	Parish Council	S. H. Stockwood, Bridgend, Glam.	Nov. 6
Weston Peverel—Police Station	—	J. Hawker, Mutley House, Plymouth	6
Bradford—Redecorating Tennyson-place Chapel	—	J. W. Thorpe, 29, Otley-road, Bradford	6
Ardley—Three Schools	School Board	Thos. Harper, Clerk, Stairfoot	8
Stairfoot—Three Board Schools	Ardley School Board	The Clerk, School Board Offices, Cradley, Leeds	8
Northampton—House, 15, Fish-street	Corporation	W. Shoosmith, Town Clerk, Guildhall, Northampton	12
Slights Bridge—Two Villas	—	D. Richardson, Newholm, Whitby	—

ROADS AND STREETS.

Leeds—Forming New Streets off Morris-lane, Kirkstall	—	J. Braithwaite, 26, Norwood-place, Headingley	Nov. 6
Dewsbury—Sewering and Kerbing Greenwood-street	—	T. W. Speight, Architect, 23, Boothroyd-lane, Dewsbury	6
Nantymoel—Paving and Kerbing Nantymoel-row, Nantymoel, and Osmore Vale	Urban District Council	S. H. Stockwood, Clerk, Bridgend	8
Castleton—Making Good Hanovers-street	Urban District Council	R. Bruce Wallis, Clerk, Council Offices, Castleton, Manchester	8
Reddish—Road Improvement Works	Urban District Council	Thos. H. Duckworth, Clerk, Council Offices, Reddish, nr. Stockport	9
Hornsey, N.—Making Good Indwick-road	Urban District Council	E. J. Lovegrove, Engineer, Southwood-lane, Highgate, N.	9
London—Supply and Laying of Asphalt	Bermondsey Vestry	Fredk. Ryall, Vestry Clerk, Spa-road, Bermondsey	10
Levenshulme—Paving and Sewering Six Streets	Urban District Council	James Jepson, 9A, Union-road, Stockport	13
Mickleham—Carriage Drive through Norbury Park Estate	L. Salomons	J. Bastin, Norbury Park Farm, Mickleham	13
Romford—Supplying and Laying Norway Granite Kerb, Victoria Stone Paving, Granite Setts, and Tar Paving	Urban District Council	Geo. Bailey, Clerk, Romford	15
Southend-on-Sea—Works on the Bournemouth Park Estate	Kilworth's Trustees	Wilson and Phillips, Surveyors, Clarence-street, Southend-on-Sea	15
Richmond—Road Works	Town Council	J. H. Brierley, Borough Surveyor, Town Hall, Richmond, Surrey	17
Enington—Roads and Sewers on the Oldway and Redcliffe Estates	P. E. Singer	R. J. Beadon, 165, Manor-street, Clapham, S.W.	20
Weston-super-Mare—Roadmaking on Smyth-Pigott Estate	—	Price and Wooler, Surveyors, Weston-super-Mare	22
Altofts—Making Good George, Brook, High, and York Streets	Urban District Council	William Wilkinson, Surveyor, District Council Offices, Altofts	22
Batterssea—New Road and Sewers, Hyde House Estate	—	F. and W. Stocker, Surveyors, 90 and 91, Queen-street, E.C.	22
Mansfield—Forming West Hill-avenue	—	R. Frank Wallace, Surveyor, Mansfield	—
Shenfield—Roadmaking and Drainage Works	—	A. T. G. Woods, Surveyor, Brentwood	—

SANITARY.

Ludgate-circus, E.C.—Alterations to Underground Convenience, New Bridge-street	Commissioners of Sewers	H. Montague Bates, Clerk, Guildhall, E.C.	Nov. 6
Tong—Sewers, &c. (1,900 yards)	Urban District Council	John Duffon, Clerk, Council Offices, Tong-street, Dudley Hill	8
Provanmill—Drainage Works	Lanark District Committee	William H. Hill, Clerk, 194, Ingram-street, Glasgow	8
Brighouse—Sewering of Victoria-street	Highways Committee	Emerson Brooke, Borough Surveyor, Public Offices, Brighouse	8
London, E.C.—Laying Pipe Sewers	St. Luke (Middlesex) Vestry	G. W. Preston, Clerk, Vestry Hall, City-road, E.C.	9
Birkenhead—Sewering and Kerbing Hillside-road, Tranmere	Corporation	Herbert H. Humphries, Engineer, Public Hall, Birkenhead	10
Erdington—Sewerage Works (2,900 yards) at Bromford	Urban District Council	Alfred Fidler, A.M.I.C.E., Borough Surveyor, Clarence-rd., Southend	10
Southend-on-Sea—Sewer, West-road, Prittlewell	Corporation	Walter W. Snailum, Church-street, Trowbridge	11
Hillperton—Draining Burial Ground	Ayrshire County Council	H. H. Hickmott, Town Clerk, Council Hall, Rotherham	15
Kilbirnie and Glegarnock—Drainage Works	Sewerage Committee	Henry Bancroft, Civil Engineer, 88, Mosley-street, Manchester	16
Rotherham—Sewers, Richmond Park District	Urban District Council	Charles Anderson, Clerk, Bridge-street, Morpeth	17
Latham, Lancs.—Sewerage Works (2,968 lineal yards)	Urban District Council	W. Onslow Times, Clerk, Stevenage, Herts	18
Ashington—Sewer, near Hirst	Urban District Council	H. Richardson, Engineer's Offices, Council House, Aston Manor	23
Stevenage—House Connections to Main Sewers	Aston Manor Rural District Council	A. P. I. Cotterell, A.M.I.C.E., Lonsdale Chmbrs, Baldwin-st., Bristol	Dec. 1

Launceston—Sewerage Works	—	—	—

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2236.

FRIDAY, NOVEMBER 12, 1897.

THE LAW OF MATERIALS.

A REVOLUTION in building is almost inevitable if we go on introducing without prevision manufactured materials as substitutes for the natural productions—mineral and otherwise—to which we have been so long accustomed. The increasing use of Portland cement, concrete, and other artificial substances as substitutes for stone has, no doubt, opened the way for a variety of inventions and methods which would have verily astonished, if not alarmed, our forefathers. What would they have thought of whole blocks of buildings constructed of cement concrete—floors of concrete and iron—stairs and landings of artificially-made blocks—window and door dressings, sills and lintels of manufactured stone—which in surface and colour almost equal the natural sand and limestones, and surpass them for qualities of strength, durability, and resistance to fire? They would have been equally astonished to behold inside partitions and ceilings made with materials other than timber lath and lime plaster, of expanded metal lathing covered by manufactured plasters and slabs of great fireproof resistance and strength. The result of these artificial productions has been to diminish greatly the amount of stone and timber in our buildings, and to utilise instead various products till lately thought useless—like slag and clinkers, and mineral fibres of the asbestos kind. That substances formerly accounted of no value and mere waste should have been thus utilised for building construction seems only to be fulfilling an economical law of which our ancestors were almost ignorant. What the consumption of stone and timber might have been if clay products and cement and iron manufacture and other waste materials had not been discovered and taken their place largely, it would have been impossible to say. Building would have become extremely costly, and our supplies of those natural productions very limited.

In the next place it is desirable to notice that with the introduction of artificial compounds like concrete, cementitious stones, cast iron, and other fabrics, the modes of conversion have been changed. To a large extent the saw, the chisel, and other tools have been superseded by moulds, castings, and other apparatus. Stone has to be quarried and sawn into blocks; the stone-cutter has to square up the rough stone, to make plane surfaces by hammer and pitching-tool, to cut drafts round the edges, and the surfaces have to be finished with the axe, bush-hammer, and other tools. Every student of masonry knows that several operations are necessary to form a springer, or a skew block for a moulded arch. But with the artificial stone all these labours are reduced: a mould can be made into which the raw materials, sand, and lime are mixed in due proportion, and the stone can be turned out under pressure to the required size and shape, all dressing by hand being dispensed with. Thus tool labour is saved, and moulded work of the most elaborate kind can be turned out at much less cost. Whether the result is so artistic is another matter; but the effect of this simplification of labour is to produce more elaborate details and multiply mouldings. Ornamental carving is also superseded by imitations cast in moulds; but as most architects know, these are spiritless and poor apologies for their existence, for they lack the real motive of carving with the tool. If

there is one greater evil than another of being an artist, it is in the employment of moulded or cast ornament—in other words, of being obliged to use a material which can only be adorned by the pattern-maker in his own way. A casting in metal or plaster cannot be like relief or carved stone, because in the first place the material is not the same, and secondly the artist who models is not a stone-carver. The architect has, of course, to face these facts, and the sooner he brings himself to square with them the better. He can at least endeavour to shake himself free from the traditions and trammels which have grown up with the older materials; to look upon the artificial productions as having other conditions, and to try and understand them; but the fatal mistake of the modern average architect is to follow that method which he has been in the habit of using—in other words, to apply the same treatment to the new material. In this manner we see stucco and cement imitations of stone details and ornament, iron columns and arches cast and moulded like those of stone, and various other blunders. It is so easy to apply the old method, as it saves thought and labour, and so the mischief is repeated and the progress of architecture hindered.

Looking at the change in another way, the introduction of composite for simple and natural materials has involved a new method of putting them together. Why is it so many of our buildings are failures architecturally? We are constantly told that our age is without an architecture of its own; that we can only copy old buildings, that our modern works, which are essentially new in conception and are built with modern materials like iron and concrete, are extremely ugly and disappointing. We cannot deny the charge, but they are so because we have not yet learned a method of combining these materials and putting them together. New materials demand new forms. As every language has its own grammar and its peculiar idioms and modes of expression, as every production of nature has its own way of growth and combination, so must every new material follow the same law. The experimental stage is, no doubt, unprofitable and unsatisfactory. We can imagine an architect or engineer putting up the first warehouse of concrete and iron, or the railway station in which iron or steel is employed on the roofs. His first effort is uncouth and unsatisfying, it is criticised freely; but still it may be a bold attempt to design in those materials without imitating old forms and features. The designer of the Forth Bridge has not certainly produced so pleasing a structure as the recently-erected Tower Bridge, though it is a bolder and more original attempt to throw off restraints and traditional treatment. What looks now more pleasing to the eye as not offending our prejudices too violently may in another half a century appear a mistake; while the bolder design across the Forth, in which the metal has been structurally disposed without any effort to conceal it, will be regarded as one of the foremost steps in the new architecture. So with many other structures, like the Eiffel Tower and other daring efforts to use iron in accordance with its own laws, which is, after all, only following the same principles of design which actuated the masters of the Greek and Mediæval ages. That the latter knew nothing of iron as a structural material was no fault of theirs; but if they had they certainly would have used it exactly as the engineer now uses it in his cantilever or suspension bridges. They would never have thought of making an iron column resemble one of stone, much less of casing it with marble. We look in vain for an architecture of concrete and iron, just because we have not yet dared to break through the conventions of an historic architecture; but it will come,

nevertheless, when the architect begins to see the law of materials more clearly than he can now. Let us take one simple object—an iron bracket for a signboard. The old craftsman of the 15th and 16th centuries, of Nuremberg, or of some Flemish town, fashioned his wrought-ironwork upon right principles. He hammered out his bars and forged and welded them into scrolls and all kinds of delicate hammered work, for he knew that his hanging sign board or his pieces of ornamental iron on his gable fronts were destined to bear chiefly tensile and cross strains. The modern cast-iron maker of brackets tries to imitate the open work and lightness of these beautiful examples of forged iron, forgetting that his material ought to be solid, and is not adapted for such purposes; so, too, he imitates the lightness of the old wrought-iron grilles, by casting his metal in ridiculously light ornament. The ornamental cast railing used before houses, with its twists and scrolls, cusped imitations of hammered work, soon tells the tale of its apostasy by a broken and mutilated appearance, while the wrought-iron railing or grille is always strong and ornamental. Why; it is needless to assert a common fact, wrought iron is fibrous, tough, and malleable, while cast iron is granular and brittle. The old smith understood the fibrous nature of their material; the modern likes to do what the old smith did, though working with a very different iron. Going back to our stone, too, the idea of even grain and texture and stratification is sadly overlooked in the same way. The old mason and builder knew perfectly how to place his stones in a wall; he laid them on their natural beds, as they stood in the quarry; he knew also the effect of stratification of veins and vents in laying and working and carving his stone; he knew exactly what his chisel or "point" could do, and if he transgressed any of these rules the work soon decayed. The cement-made stone of aggregates and Portland cement is unstratified; it has no veins of flinty hardness interspersed with calcareous matter or soft grains; in a word, it is perfectly even in texture, and can be placed in almost any position; it submits to the process of either moulding or tool-working. Do these differences of texture suggest any correspondent treatment? We have no evidence that they do, or that the manufacture of any of our artificial stones has been at all taken into account. One other important fact remains. The ancient granite and stone architecture was monolithic. Great masses of granite or marble were used by the Egyptian and Greek builders; but now the tendency is to use small blocks of stone or baked clay. It is true concrete blocks of huge size are made for quay and dock walls and breakwaters; artificial stone slabs of large size for floors and landings; and we have floors and ceilings constructed of monolithic proportions, but they are not in the same sense monolithic. Again, our construction is no longer simple, but composite. Even our artificial stone landings and floors are made up of several substances incorporated together, aggregates and cement and iron. Our construction also is no longer solid like the ancient, but to a large extent cellular or hollow; and here we have a very important principle to remember. What are our best fireproof floors but cellular structures of concrete and iron? What our most effective domical erections but cellular constructions in which the forces are concentrated in a few ribs filled between with some light material, and so of all modern contrivances in which thrusts and stresses are restricted to iron members? Has the modern designer looked at the possibilities of this system? Boldly face it he must. He cannot be always affecting the solid treatment.

The effect of these influences upon the architecture of the day, it may be premature

to predict. From what we have said, the change has been in the direction of greater complexity. The homogeneous and solid construction of stone is gradually giving place to a more composite and cellular mode of building, in which artificial products and fabrics of the most varied kind enter. Solid, thick stone walls are less used; brick, concrete, terracotta, faience, in combination with iron and steel, are rapidly supplanting the monolithic system of building, especially in America. A skeleton structure of steel, with the interstitial spaces filled in by certain walls of light material, is a mode of building common to all the cities in the States. In this country, artificial stones, cement, iron and steel, and a host of new materials of a decorative character are competing with stone and timber, and it is left to the architect to combine and adapt them in the best way he can. No longer are solidity and massiveness required to give stability and resist external forces as of yore, but the designer has to arrange his materials so that each shall do its part. Resistance of pressure or strain is now to be met by specially-designed sections of masonry or iron distributed in the body of the work, so that the material is employed to the most economical advantage. These are the problems which the modern designer has to face. Hitherto he has been groping in the dark, trying to bring his design into line with old examples, sometimes ignoring the new conditions, at other times clothing them with old forms, courses which are leading him into a hopeless state of distrust and uncertainty.

TECHNICAL OBJECTIONS.

RED-TAPE and technical points of law frequently impede the operation of the London Building Act. District surveyors and Metropolitan magistrates are often at loggerheads about some point of wording a notice, the date of serving a notice, or some question of interpretation. These vexatious hindrances only serve to delay the administration of the law, and to encourage litigious owners and builders to disobey the regulations of the Act. Several instances of this kind have occurred of late. Not long ago the London County Council moved for a rule *nisi*, before the Divisional Court of Queen's Bench, for a mandamus, calling upon Mr. Mead, the Metropolitan magistrate, to show cause why he should not hear a summons under the Dangerous Buildings Clause. In this case the County Council had not been able to find out who was the owner of the buildings in a dangerous state, and the notice had been affixed, according to statute, on the premises. This mode of serving the notice was not considered right by the magistrate, who thought that the summons ought to be served personally on the unknown owner, as required by the Summary Jurisdiction Act. As was pointed out by the counsel of the County Council, if this ruling was right, it would be impossible for the Act to be carried out in all cases where the owners could not be found. A rule in this case was granted by their Lordships. We believe it is no uncommon occurrence for the County Council to find it difficult to trace the real owner of a dangerous building. Clause 106 of the Act makes it clear that if the certificate of the surveyor is to the effect that a certain structure is in a dangerous state, the Council may cause the same to be shored up and secured, and a proper hoarding put up for the protection of passengers, and shall cause a notice to be served on the owner or occupier of the premises requiring him forthwith to take down or secure the same. If the owner cannot be found, section 188 provides that the notice may be served by delivering a copy thereof at, or sending it in a registered letter by post, to the last known residence (in

the United Kingdom) of the person, or to some person on the premises, or if no person be found on the premises, then by fixing a copy on some conspicuous part of the building. A sub-clause says any notice by this Act served on the "owner" or "occupier" may be addressed by the description of the "owner" or "occupier" of the premises (naming the premises) in respect of which the notice is served without further name or description. According to these provisions, the County Council had strictly, it would appear, followed the Act. In another instance, the magistrate at the Westminster Police-court was called upon to decide a case in dispute between a builder and a district surveyor. The builder obtained a building agreement from the Crown in respect of some buildings, and was about to rebuild loftier and larger premises; but the district surveyor objected to the plans, and gave notice of the same, on the ground, among other things, that sufficient open space was not provided for at the rear of the new buildings. The magistrate decided that the district surveyor's notice was wrong, and should have been differently framed. The builder's appeal was accordingly allowed, with costs. We are not informed what was wrong in the notice; but the question of greater concern to the holders of property is that their rights in respect of buildings erected prior to the passing of the Act ought to be observed.

We could mention other instances in which magistrates have refused to hear summonses on the ground of informal or defective notices, the consequence of which has been a delay, or the case has been dismissed. A well-framed notice depends on many technical points—on a careful study of the definitions of the Act, and of various provisions such as given under section 187 *et seq.* No doubt there is considerable difficulty experienced in carrying out these provisions. Responsible owners absent themselves to avoid expense; occupiers are not to be found, and magistrates are eager to find out errors in the notices. Great responsibility falls upon the district surveyor in these circumstances: instead of being assisted, he is thwarted in the performance of his duty. The unfortunate part of the technical opposition is that dangerous structures, inferior construction, and the encroachment on areas in and round buildings; erections of greater height than are permitted by statute law are allowed to pass, and the spirit of the Act is seriously impaired. We have no doubt the objections of the surveyor in some cases are trivial and vexatious, or there has been a lack of cordiality between owner or builder and district surveyor, the latter may have acted precipitately on insufficient evidence, without giving the builder the opportunity of seeing the mistake. But in the majority of instances the fault is with the owner who likes to "steal a march," or take advantage of a wrongly-dated or worded notice. In the case of dangerous and neglected structures, the Act allows the owner, if dissatisfied, to give notice in writing to the Council of his desire to refer to arbitration; he may, in fact, appoint an independent surveyor to report in conjunction with the district surveyor on the state of the structure, and if they cannot agree, the question may be referred to a third surveyor previously appointed as an arbitrator. These provisions allow the owner of any dangerous or objectionable building to obtain a fair hearing.

THE ARCHITECTURAL ASSOCIATION.

THE third ordinary meeting for the present session of the Association was held on Friday evening, the President, Mr. Hampden W. Pratt, F.R.I.B.A., in the chair. The following fourteen gentlemen were elected as members:—E. P. Archer, A. C. Stair, C. C. Duggan, R. C. Fry, J. Haslam, C. F. Innocent, E. H. Kent, F. G. May, E. O. Payne, W. S. Payne, J. H.

Pearson, C. E. Pease, C. M. Quilter, and E. R. Taylor. Mr. N. L. Ashburner had, it was stated been reinstated as a member, and five nominations for membership were read. The President announced that the annual *conversazione* would be held on Friday, the 26th inst. (a fortnight hence) at the Matinée Theatre, late St. George's Hall, Langham-place, W., where a play, specially written by Mr. F. D. Clapham, would be rendered at 8.45 p.m., entitled "The Broken Contract; or an Egyptian Enigma."

A PROPOSAL FOR CLASSIFYING BUILDERS' WORK.

Mr. S. FLINT CLARKSON, F.R.I.B.A., past-president, read the following paper on this subject:—The proposal is that Classes, such as fair (A), good (B), best (C) shall be agreed upon. The suggestion is made in the interest of employers, architects, and contractors. It will probably be about equally serviceable to all, as long as contract amounts are settled by competition tendering. Other systems besides competition may be tried with advantage; but at present the greater part of the work is allotted in that method, which seems likely to be kept to also in the immediate future. Drawings, specifications, quantities, competitive estimates, clerks of works, and other superintendence, and 5 per cent. are the recognised machinery by which an employer gets exactly what he ought to wish for, and is assured that he is to pay no more than the market price for it. We propose only a minor improvement in the regular machinery. Let us see why it seems desirable.

GRADATION IN QUALITY

is as legitimate in builders' work as it is in anything. People know this very well, though they may grumble when gradation takes too wide a range. Proportion is not simply securing the right relation of function and apparent importance. Thorough proportion requires that materials and workmanship shall be varied judiciously by the architect in different buildings, and in different parts of the same building. Blunders and wild tendering will account for anything, but there will be smiles, and notes of admiration also, for less outrageous disparities—which might often be traced to misapprehension as to the class of work required. Between work of the highest class and fair work without pretension to excellence, there is a wide distance. From work ranking with the best of all time we reach by proper stages the most ordinary work—sound and serviceable, though wanting in fineness of quality and finish; and thence the *declassis* may be reached—found in building as in life. Certain contractors lay themselves out for work of a certain kind—selecting workpeople and materials accordingly—and anything out of the usual course meets with less cordial welcome, and is sometimes not competed for with eagerness. The selection of such imperfectly sympathetic contractors accounts for other bad tenders—as also the selection of people who differ a good deal in the class of their business. Classification of work will not help us over all difficulties, but it may be of service in many. Any decent names of classes will prove better than any others as soon as they are generally accepted. Naming of sub-classes would cause little trouble; everyone could do it for himself, or definitions might be agreed upon from time to time, and then used in general practice. There must naturally be two extremes and a mean. The worst work with which an architect could be connected would be at one end, first-rate monumental work at the other, and something better than the one and less excellent than the other between.

SUGGESTED CLASSES.

Class A.—Nothing special anywhere; the most current things in all trades. Class B.—Something below the best; special design, adaptation, &c., in the more important parts of the building; good execution, but a keen regard for cost. Class C.—Excellence in materials and execution; the most finished work of the time; for the best public and private buildings. Objectors will hint that some contractors might try to supply the least costly work of its class—in fact, the worst work which the architect would pass—instead of what was intended; but the same sort of contractors do that sort of thing now. It will also be suggested that several specifications are not effective, and that classification might be interpreted by some architects as an encouragement to undue brevity. "The building is to belong to Class B, and is to be completed in all respects accordingly," is the pithiness which is

feared; but the passion for detail will keep most architects on the old lines. Hurried, slovenly, and generally inferior specifications (and drawing) should not increase in number, as they are serious evils; but it does not follow that anything which might prevent an inferior specification from failing hopelessly would necessarily be an evil. Hopeless failure results when everything proves adverse; but pursues pleasantly full, well-occupied lives, and a healthy appetite for compromise, enable many meagre specifications to keep their virtue. Sometimes they are even (in retrospect) looked upon as blessings in disguise. Some employers appreciate low tenders; the architect who has obtained so much for so little is spoken of as skilful and economical; and the contractor, if treated with judicious liberality, does not object to posing as a benefactor who works more cheaply than other people. Contractors are sometimes informed, in suitable language, that they are not to add a large sum per page of specification to their tenders, because the specification seems unusually big, and so much per drawing also, because some of the detail drawings, which will form part of the contract, have been prepared in good time instead of later on. Shrewd employers have the same thing in view when they ask whether a specification of 150 pages is really necessary, and hint that explanations about moderation in quality to the builders submitting tenders should be very precise. The mention of a recognised class of work at the beginning of a specification

NEED NOT LEAD TO THE OMISSION FROM SPECIFICATION

of a word. The proposed prefatory words would, however, throw a strong light upon every detail. There are pieces of work which fall to every one of us, where time is so all-important, that delay of a few days in starting the work may lead to serious reflections on the energy and resource of the architect. These are, happily, exceptional cases, though apparently on the increase. But an architect thus pressed for time, after describing all special items and throwing the rest of the work into one of the proposed classes, might feel solid ground under his feet in carrying through a contract. The Classification would frequently be, in effect,

A RECORD OF THE RESULT OF NEGOTIATIONS;

such a record as ought to be in writing, in view of the uncertain future—for general understandings are frequently misunderstood; memory fails, or ill-will and bad blood distort it, and much else; or parties die and give no sign. People who can get on with very imperfect specifications manage to struggle through with more perfect ones. Difficulties arise when a contractor tries to supply a good deal less, and an employer at the same time asks for a good deal more, than the discreet architect considers that the contract provides. The employer, who anxiously suggested explanations to the contractors as to a moderate sum and a good deal of work for it, may find that events before the contract was signed, after a busy interval, become more and more shadowy. He then prayed, as a favour, for mediocre work; now he and his friends read the specification with much care, and interpret conventional phrases literally and liberally—and there is perhaps assistance for them from legal minds. If the contract made it quite clear that work of Class A was intended, such an employer might be disposed to leave things alone. An architect selected because he has a reputation for thoroughness and work of high quality; an appeal by the employer for the mildest treatment such a reputation will permit; resolute bargaining and a low contract sum; and in the sequel a tender solicitude for the keeping up of the architect's reputation—might thus, in the future, be treated by a playwright as one of the dramatic situations possible only in the elder days. No minor change will prove a panacea for all building ills. A trial of classification is only a modest little practical proposal. It could be easily introduced, and should be generally accepted in a short time.

SEVERAL OBJECTIONS TO THE PROPOSED CLASSIFICATION

were raised in the discussion which followed the reading of the paper. The President remarked that at first sight the matter seemed very simple; but the more it was looked into, the more difficult any such system appeared to realise in a practicable way. If they inspected a completed building it was quite possible to classify it as A, B,

or C; but how could they classify a structure not yet commenced? The different degrees of merit in buildings were, after all, matters of specification, and rather depended on qualities of material than on workmanship. He could conceive of contractors very reasonably saying, for their own reputation's sake, that their works were only of one class, and that the best, and thus the first class of men would be self-excluded from tendering for works of class B or A. Again, many buildings would fall under various classes in their several parts. He thought the question was much more one for builders to discuss than for architects.

Mr. W. H. SETH-SMITH, in proposing a vote of thanks to Mr. Clarkson, said his proposal was very fresh, but he feared it would be exceedingly difficult to put into practice. After all, two-thirds of the cost of a building was for workmanship, and this must be paid for in any case at trade union rates. The suggestion was one for consideration between architects and clients rather than architects and builders, and it was most desirable that from the very outset the architect should know the character of building desired by the owner.

Mr. J. H. LEANING said they were so much indebted to Mr. Clarkson for giving so much consideration to a subject of great interest to the profession that he was sorry to have to totally disagree with his conclusions. The question had been the undercurrent of an architect's life for years. Every professional man felt that, let him do what he might, he could not always get what he wanted from the contractor, and yet he realised that he could not reject everything. In every contract the builder seemed to look round and expect some advantage, and the architect felt a little reluctance in squeezing the utmost from the contractor. In the case of a job which was obviously not of the highest class there was still more leniency in the mind of the professional man. A distinction should be made between such cases and those in which the architect, instead of being master of the works and chief director, was merely a spectator. Just as a horse could tell in a few minutes whether his rider knew his business, so did a builder, with a few feelers, and an interview, and a detail, know his architect. Seeing how far he could go, and being only human, the builder generally went that far, and a little farther. But they were discussing the effect of all this upon the practice of the qualified and honest practitioner; as for the other class of man, nothing could be done for him, and the sooner the public found him out the better. Now it was suggested by Mr. Clarkson that the establishment of a series of classes or grades of quality would dispel this hitherto unspoken-of element of uncertainty in building, and that by adopting this system they would eliminate the speculative margins which builders when tendering on the present system were compelled to allow. The classification was not, it appeared, to take the place of the architect's specifications; on the contrary, it would not lead to the omission of a single word. Its effect would, therefore, be to further define the architect's definitions, or, as Mr. Clarkson had put it, "to throw a strong light upon every detail." He proposed, therefore, to examine briefly where the differences between good and bad materials and workmanship were to be found. Firstly, by the fitness and efficiency of its several parts, such as thicknesses of walls, scantlings of timber, and the amount of detail put into finishings; these surely were matters entirely determined by the specification, the drawings, and details. Secondly, by the quality of the materials used and the style and finish of the workmanship. Attempts were made in most specifications to regulate this factor also, and it was presumably this branch of the specification to which Mr. Clarkson would make his classification apply. He (Mr. Leaning) made these apparently superfluous generalisations because there seemed to be a confusion of ideas in Mr. Clarkson's definition. He said that Class B related to "Special Design, Adaptation," &c. Did this mean that the builder was tendering from 1/4th scale drawings, and that he must allow for some special mouldings and architectural efforts, which would come in the first category, here and there, although not shown or specified? Or did it mean that for the class of buildings in which such things were to be found? Class B was the one most suitable; but as it read it was misleading, because Class C reverted to the second category, and said, "Excellence in Materials and Execution." He (the speaker) wished to empha-

sise this, because it brought him to his first point—viz., that the classification could only be made to apply to the quality of materials and workmanship, and not to the drawings and detail. The latter, of course, were dealt with by the quantities, and if varied, could be adjusted. Mr. Clarkson did not mention quantities, but alluded to contractors tendering at so much per detail and so much per page of specification. That might, perhaps, explain his difficulty. How was it that a speculating builder could produce a house for so much less than could the architect? Largely, he (Mr. Leaning) maintained, by economies effected in the first category, such as varied proportions for mortar and concrete, thinner inner walls, reduced scantlings of timber and lap of tiles or slates, omissions of roof boarding and felt, omissions of grounds to all joinery, two-coat plastering instead of three, stock mouldings, zinc instead of lead, cast railings instead of wrought, three-shilling locks and eightpenny taps, cast-iron mantel registers instead of grates, varnish in lieu of French polish, cement fillets for flashing, composition gaspipes, no attempt at ventilation, 15oz. glass instead of 21oz., &c., &c., and, in addition, the omission of architect's fees and surveyor's charges. All these were quite distinct from any general saving in quality of materials or workmanship, and were capable of clear and easy definition by drawings and specifications. They did not, therefore, concern architects, but with the second category they were now seriously dealing; but even here there was very little which could evade clear definition. The speculating builder saved by using grizzlies and placers for his brickwork, and employed promoted labourers to build it, with the result that there was no bond, the joints were badly filled, and the perpend bad. He used sand no one else would have, lime that was stale, spruce deal for floors and joinery, foreign steel, light lead pipes and light lead or zinc, thick laminated slates, probably inferior Port Madoes. Lastly, and most important, the speculating builder employed piecework, which meant the minimum of labour everywhere. But even here, as regarded materials, the architect was able, without much trouble, to bind the builder hand and foot. He could specify the maker of his facing bricks, the maker of his lime and cement, the maker and quality of his glazed bricks or rubbers, the quality of his sand and where it was to be obtained, the maker of his steel work, the quarries and quality of his stone, the weight of his lead and zinc, and so on. The architect's chief difficulty was with regard to his timber and deal. As to these, insistence upon well-known brands seemed to be the only safe guide; but considering the fact that the joinery and carpentry generally amounted to one-fifth part of the whole job, and that half that represented labour, while the difference between the best deals now used for buildings and fourths was not more than 30 per cent., the possible saving on a £2,000 job could not be more than about £60. As to labour, it must be admitted that the architect could not specify so precisely. The only protection, especially just now, was to go to builders who held a command of the labour market, and with whom their leading men in each trade had worked for years. An acquaintance with the methods of workmen and with the capabilities of modern machines, and a careful study of the various ways of doing the same thing and the relative value of the results, ought to qualify an architect not only to specify intelligently, but also to be certain of getting what he wanted. They saw, then, that the proportion of work in a building which was indefinable was really quite small, and got smaller with every day of our increasing technical education. The classification would be very well if applied to separate articles; but when applied to a collective mass it ceased to have any meaning. Further, it allowed nothing for questions of taste, nor for locality. He hoped he had succeeded in showing that by the present system it was quite possible, and by many architects whose name it would be invidious to mention, to produce works of the very best description, and, where necessary, to economise without any sacrifice of good construction or taste. It required a great deal of attention to secure this result, but so did everything worth doing, and Mr. Clarkson's proposed classification would need quite as much definition as the specification would. Quantity surveyors were often reviled for their long-winded specifications. They were willing martyrs; they had their

reward in a long rest after the signing of the contract, for with their specifications and an intelligent builder there was no contingency that could arise which was not answered by a clause in the specification; without such a specification daily letters arrived asking what had been taken, and how the contractor was to carry out the work.

Mr. J. DOUGLASS MATHEWS thought there could be little difficulty with the best class, and little more with the lowest class of buildings; but many obstacles would present themselves in the way of getting work of the quality demanded for the medium classes. The differences in timber and fittings could all be covered by the specification and drawings, and he feared that the builder's tendency would be to carry out each work according to the class just below that specified. He would suggest that Mr. Clarkson should write a further paper on the subject for consideration at the R.I.B.A., in which the treatment of this subject should be a little less foggy.

Mr. HENRY LOVEGROVE thought the names of classes should be reversed, and that "A" should denote the best quality, and "C" the lowest. What would Mr. Clarkson do in the case of a building specified to be of the poorest class, if subsequently defects showed themselves in the building? Could not the contractor shelter himself under the fact that it was specified to be of the lowest quality?

Mr. J. OSBORNE SMITH held that no builder could mistake the class of building required if the specification and drawings were clear and materially consistent; and Mr. MAX CLARKE failed to see what object would be gained by the architect or building owner by the proposed classification. All builders believed that the work required belonged to the lowest class.

Mr. CLARKSON, in replying to the vote of thanks, said he was surprised that so few speakers had seen the desirability of such classification. He should not abandon the subject, but should carry the proposal further in a paper to be read elsewhere.

SOME NEW BUILDING MATERIALS—ASBESTIC AND PETRIFITE.

Mr. H. D. SEARLES-WOOD, F.R.I.B.A., past-president, read the following paper on these materials.

ASBESTIC.

Asbestic comes to this country, he explained, from Lower Canada, and is a name given to a by-product from the manufacture of asbestos from serpentine. After the fine white fibrous asbestos has been extracted by machinery, this sand and it is the various uses to which this can be put that he proposed to call attention. It is claimed for plaster made with ordinary lime and asbestic (the proportion recommended being 3 cwt. of lime to 1 ton of asbestic) that it is absolutely fireproof, and being fibrous and possessing very great elasticity, there is no cracking, chipping, or crumbling away, and nails driven into it enter in the same way as into a pine board, and can be easily withdrawn. This plaster is also a perfect non-conductor of heat. It is stated that this plaster, being a perfect non-conductor of sound, has a curious effect on the room or hall where it is used, making them much easier for singing or speaking in. For the protection of metals, this substance has a great future. An elaborate series of experiments were carried out by General Povey Smith, when he found that asbestic not only protected the metal against fire, but at the same time preserved it from any corrosion. The covering properties of the asbestic plaster are about 40 per cent. more than those of ordinary plaster, and it is 40 per cent. lighter to handle; the mixing and application are so much easier that there is a saving of 25 per cent. in actual labour. The

DIRECTIONS FOR USE

are given as under:—For rough coat: Slake about 3 cwt. of lime, and while liquid run it through a sieve into a box large enough to hold one ton of asbestic. Mix thoroughly, adding the requisite amount of water. After the lime and asbestic are thoroughly mixed, the plaster should be allowed to stand at least twenty-four hours before being used. For finishing coat: Mix two parts of lime to one of asbestic finish and gauge with plaster of Paris. No hair or sand is required. The price of the asbestic, per ton of 2,240 lb., is £3; asbestic finish, £5. The sole agents for London are Messrs. Witty and Wyatt, of 88, Leadenhall-street, E.C., where numerous samples can be seen. The plaster takes about

three weeks in setting to get thoroughly hard, and it gradually toughens after that time. The asbestic is now being made up in slabs about $\frac{1}{4}$ in. thick; these can be worked as easily as wood, and as non-conductors of heat and cold they can be utilised for walls, ceilings, cornices, mosaics, &c., and can be used out of doors and coloured as required. This material is far more suitable for buildings in new countries, such as Africa or West Australia, than corrugated iron or canvas and framing. The non-conducting property of asbestic plaster would be of great value. For hot countries glazed asbestic tiles are being made for roofing purposes. In the manufacture of paper, asbestic is being largely used. Paper 130 in. in width is being produced in one factory for building purposes. Asbestic has been recently selected by the London County Council as one of the fireproof materials that may be used in the alterations at Olympia. Talking over the subject of this paper with Mr. Drew, when at Furness Abbey, the lecturer asked him what new material in his opinion was most wanted. He replied, "An artificial slate." In the samples produced, the surface is smoother than intended; but they show that a good roof covering can be made in this way. They would be light, non-combustible, and non-conducting, and could be made to any shade of colour.

PETRIFITE

is a white cement which appears to have the power of binding together almost any material that can be thought of. The principle of the invention was discovered in 1891; but it was not until some years later that a cheap and practical method of making petrified was worked out and patented, and even now it is not practically on the market, though he was informed that it is hoped it may be by the 15th of this month. During the lapse of time from its discovery a large series of exhaustive and interesting experiments have been made, and some wonderful results obtained. Messrs. David Kirkaldy and Son have reported on the following experiments:—

RESULT.

25 per cent. Portland cement and clean pit mud, petrified, and ordinary sea-sand.	Petrified eleven times the strength.
Petrified and common earth.	Nearly four times the strength.
Natural Bath stone: 10 per cent. petrified and ordinary sea-sand.	Nearly twice as strong.
Natural Portland stone: 25 per cent. petrified and ordinary sea-sand.	Stronger when only 30 days old.
Marble Carrara blocks: 50 per cent. dust from the same with petrified.	Eight per cent. stronger.
Tensile strength: 25 per cent. Portland cement and clean pit mud.	Over five times as strong.
25 per cent. petrified and clean pit mud.	Over seven times as strong.
Tensile strength: 25 per cent. petrified, sea mud, and powdered chalk.	Nine times less porous.
Porosity: 25 per cent. Portland cement and clean pit mud.	
25 per cent. petrified cement and clean sea-sand.	

In a further report made by Messrs. Kirkaldy in May, 1897, as to the effect of immersion in water, it was found to reduce the ordinary petrified 25 per cent. in strength, as against 10 per cent. in natural Portland stone and 20 per cent. natural Bath stone; but in samples made with hydraulic petrified, which is ordinary petrified mixed with from 5 to 10 per cent. of inexpensive materials, the diminution in strength is slight. As regards hardness of surface and hardness internally, there is hardly any appreciable difference between 2 to 1 Portland and 6 to 1 or 9 to 1 petrified. A backing of 6 to 1 petrified, faced with 3 parts plaster of Paris to 1 of petrified, yields a hard and smooth surface very suitable for walls. The tests made to ascertain the relative adherence of petrified mortar show that 6 of sand to 1 of petrified adheres as well to the face of rough bricks as good Portland cement mortar mixed 3 to 1. In the case of bricks with rather smooth surfaces, petrified mortar gave nearly four times the adhesive strength. Petrified mortar mixed 3 to 1 with smooth bricks had ten times the adhesive strength of the same proportion of Portland cement mortar. Another feature of petrified is that it adheres to wood. Messrs. Kirkaldy summarise their two reports by stating that petrified has the following valuable properties:—(1) Its combinations have great crushing and tensile strength and adhesive qualities. (2) It will solidify unclean materials, the presence of which, even in small quantities, would be fatal to the setting of Portland and other cements, and bind together into useful blocks many substances which cannot now be utilised. (3) Dirty or unwashed materials can be used, which is not the case with other

cements. (4) Its compounds do not sweat or effloresce, thus enabling sea sand to be used. (5) It will adhere perfectly to wood or iron. (6) As ordinarily used it solidifies slowly, so that work need not be hurried; it then dries and sets hard with great rapidity. (7) It is so powerful that a much smaller quantity suffices, considerably reducing the cost of freight and transport. (8) After setting has commenced, it can be still used again, as but little deterioration takes place, unlike other cements, when small quantities have to be mixed for immediate use. (9) It does not become inert after exposure to a damp atmosphere. (10) It may be used when quite freshly made, without fear of failure. Messrs. Slunger and Blount's report states that petrified, when mixed with a suitable aggregate—e.g., sand—expands on setting to about the same small extent as Portland cement. Mr. G. F. Harris, stone and quarry expert, summarises his very interesting report on petrified sandstone, that the Petrified Company can deliver a first-class dressed building stone in London at a price under half that of dressed natural building stone, and of a superior quality. As a plaster, petrified has been reported on by Mr. Marson. Its advantages over Portland cement are that it can be used with sea-sand without risk of efflorescence, and the surface is harder and closer than when Thames mud is used. Petrified grips the whole surface, both smooth and rough places, and, being "fatter" than Portland cement, can be laid more easily and dries better. Compared with Keene's cement, it has the advantage of being non-porous, much harder when set, and can be worked much more quickly. If petrified compounds are painted whilst wet, the paint sinks into the soft material. It takes no longer to dry than ordinary paint put on woodwork. In twenty-four hours a room can be finished and ready for occupation. With colouring matter, petrified and water is a first-class substitute for ordinary distemper. As a cement for iron, an ordinary galvanised iron building can be covered with petrified plaster, and will adhere perfectly. Petrified has one special quality—viz., that the water which is added does not evaporate but enters into a chemical union with the cement. The hardening process takes a very short time; it may be delayed by cold weather. Used as artificial wood, petrified mixed with sawdust has certain advantages over ordinary wood. This artificial wood can be cast into any shape or size, and can be worked with the same tools as ordinary wood. It also has the advantage that it can be made in large masses, uniform in quality and strength throughout. Petrified can be run, moulded, or worked by a tool; either moulded and built in the walling in blocks, or run and modelled *in situ*.

A vote of thanks was accorded to Mr. Searles-Wood on the motion of Mr. SETH SMITH, seconded by Mr. C. H. BRODIE. In reply to the President, Mr. G. F. SEDDON, the engineer to the Petrified Company, gave some further particulars as to that material, and explained that when placed on the market the price would be about 60s. a ton, or 50s. for the petrified cement, thus comparing with Keene's cement. The President remarked that they had heard all the advantages of the material—what were its weak points? To which Mr. SEDDON said that Messrs. Kirkaldy could not find any weak points—a reply received with hearty laughter and applause.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—VIII.

By AN ASSOC. INST. ELECT. ENGS.

ACCUMULATORS (continued).

HAVING shown the possibility of storing energy, it now remains for us to consider the various storage cells on the market, and to add such particulars respecting the characteristic qualities, capacities, weights, and dimensions of each kind, as may lead to the proper selection of a battery to suit the requirements of individual cases. We shall then refer to the general methods of working accumulators, and it is particularly important to remember that storage cells play a very useful part in private installations, and that consequently the choice, fixing, and working demand more attention than in central lighting stations, where fully qualified engineers are in constant attendance. Many firms now undertake to fix batteries, and to maintain them in working order by contract. In cases where unqualified

persons have to attend to them, it is a good plan to adopt this method, since the abuse of accumulators is always attended by bad results. With private installations it is advisable to call in the makers or some expert to inspect the storage cells at regular intervals, by which means the life of the accumulators may be prolonged.

The following are the most common types of cells in use for private installations:—The "E.P.S." cell, the "D.P." cell, the "Epstein" cell, the "Chloride" cell, the "I.E.S." cell, and the "Tudor" cell.

The E.P.S. cells are manufactured by the Electrical Power Storage Co., and are well known both for private installations and central stations. This type is of the Faure or pasted plate pattern, and as these cells have been in use for many years, they have undergone many improvements, and now are justly considered among the best on the market. Their low cost of maintenance and high efficiency have given every satisfaction. There are two general types of E.P.S. cells adapted for private installations, the earlier "L" type, and the more recent "K" or high-discharge type. The former is specially recommended for large storage capacity, whilst the latter is recommended for varying loads. The normal rates of discharge are 4.5 and 8.5 amperes per positive plate for the "L" and "K" types respectively. We give below particulars of these cells, and here may add the advantages claimed by the makers for the "K" as against the "L" type:—

1. The space occupied for storage per ampere discharge for the "K" is about half that required for the "L" type cells.

2. The weight for storage per ampere discharge for the "K" is about three-fifths that necessary for the "L" type cells.

3. The number of plates to be maintained with the "K" type is only half the number as when the "L" type are used, the load being the same, in both cases.

4. The prices of the two types of cells having the same number of plates being approximately the same, the cost per ampere in the discharge circuit is, in the "K" type, only about one-half that of the "L" type.

L 31	96	50 to 60	1 to 60	660	18 1/2 x 22 x 31 1/2	265
K 15	44	30 to 50	1 to 50	196	9 1/2 x 11 1/2 x 15 1/2	161
K 31	88	62 to 125	1 to 125	420	18 1/2 x 22 x 31 1/2	330

The "D. P." cell is manufactured by the D. P. Battery Company, being the joint invention of Dujardin, Drake, and Gorham. The plates of this cell are built up of a number of roughened lead strips placed horizontally one over the other, the face of the plates being formed by the edges. To give stability, the ends of the strips are lead-burnt into a solid lead framework formed by upright rods. It is claimed for the D.P. cell that it combines the durability of the Planté cell with the capacity of a pasted type. The construction of the plate (1) presents a large active surface, and gives to them a high charge and discharge rate without fear of disintegration or buckling; and (2) enables them to expand, whilst forming, and contract, during discharge, without injury. The plates are formed in the same way as Planté plates. From the large number of private installations using these cells it is evident that the D.P. accumulator has proved itself to be a satisfactory storage cell.

The "Epstein" plates are prepared by boiling solid lead plates in a 1 per cent. solution of nitric acid and water until the plate assumes a dull-grey appearance. In this condition a deposit of lead salts is formed when dried in the air, and as this adheres to the plates, a porous surface, insoluble in dilute sulphuric acid, results. Furthermore, the surface of the plates is increased five-fold since both sides are corrugated, and, after boiling, is in a condition to be formed electrically, and it very readily acquires considerable electrical capacity. These cells are particularly adapted for very heavy discharges,

since there is no tendency to dislodge the active material from the grooves. The normal maximum rate of discharge is 30 amperes per positive plate, which for short periods may be doubled. Under the normal rate of discharge the capacity is 120 to 150 ampere hours per positive plate, whilst at half the normal rate the capacity is 140 to 170 ampere hours per positive plate.

Since this cell was introduced it has rapidly grown in favour, and is much used in private installations; and for the purpose of making comparisons between the Epstein and other cells, particulars of the various sizes are given below. The advantages claimed for this cell are:—(1) Great mechanical strength, and no tendency to buckling, since the solid web of lead in the middle provides a strong backbone. (2) Impossibility of disintegration of the active material. (3) Minimum internal resistance, because of the intimate contact between the active material and the conducting parts. (4) Impossibility of "local action" taking place between the active material and the conducting parts.

The "chloride" cell is manufactured by the Chloride Electric Storage Syndicate, Ltd., and from the results which have already been obtained, it is looked upon as one of the most promising storage cells, and is rapidly coming into favour, although but recently introduced commercially. Both at Manchester—where it is used for equalising the distribution of electrical energy during periods of heavy loads, and for relieving the generators after midnight—and in connection with the Isle of Man tramway system, it has proved itself capable of withstanding rough usage and heavy discharges.

The method of manufacturing the cells is unique, and embodies certain features of construction different from those already mentioned. Small square tablets made by mixing chloride of lead with a given proportion of chloride of zinc, are placed in a mould so that a grid or framework of lead alloyed with a small percentage of antimony may be cast round them, great pressure being applied to force the molten mixture into the mould. On removing the chlorine and zinc from the compound plate by a process of electrical disintegration (which takes place when the plates are immersed in a dilute solution of zinc chloride together with zinc plates, and a current sent through them), there is left a considerable amount of porous lead within the framework. They may then be readily formed electrically in the usual way, which gives the plates a more homogeneous and perfect nature, absolutely uniform and of maximum porosity, enabling them to have an exceptionally high storage capacity. Furthermore, the process gives a combination of perfect electrical and mechanical connection between the framework and the active material. The great porosity of the active material and the special process of manufacture permit a very high rate of charge and discharge; in fact, the makers claim that they may be discharged, if desired, in one or two hours, without detriment or risk of damage, and charged in three hours. For private installation work two types—the R and S types—are manufactured. The former, permitting very high rates of charge and discharge, is recommended for general working where the rate of discharge

is not required for more than eight or nine consecutive hours; whilst the S type is recommended for high storage capacity. The following particulars show that the weight of these cells for a given capacity compare most favourably with any cell in general use. The advantages claimed for the chloride cells are solidity, durability (disintegration of active material almost impossible), efficiency, and cheapness.

Another cell recently introduced is the "I. E. S.," manufactured by the International Electric Storage Company, Ltd. The plate is made of a lead-shaped grid somewhat like a comb, and this grid is then fitted with strips of perforated sheet celluloid in the manner which has proved most successful from a practical point of view. The active material is then laid on, and the whole plate at this stage of its manufacture presents a surface entirely composed of lead oxide. It is then slipped into a perforated celluloid envelope which it fits closely. The plate is then ready for use, and after its first formation by charging settles down into a solid and compact plate, which, however, can freely expand and contract to the required extent, and in which no travelling or movement of the particles of the active material can take place. The capacity of the plate is claimed to be from three to five times that of the E.P.S. plate of the same size and surface. It is also capable of standing heavy charges and discharges.

The last cell which we shall describe is the "Tudor" cell, the invention of Henry and Hubert Tudor, and previous to its introduction to the English market it had an extensive sale on the Continent. The process of manufacture combines the Planté and Faure processes, and presents free play to the active mass without affecting its bearer. This is accomplished by employing a naturally-formed plate (Planté's method) as the positive, and a pasted plate (Faure's method) as the negative. The positive plate is cast in a special mould, and, having a number of grooves, presents in proportion to its weight a large amount of active surface, approximately eight times that of a smooth plate of the same external dimensions. The result is that solidity is secured, together with perfect connection between the peroxide and the lead conductor. The efficiency of these cells is high, and the durability greater than with ordinary pasted cells, since the positive plate is the one which deteriorates most quickly. Furthermore, they may be quickly charged, and, if desired, may be discharged in one hour.

THE SURVEYORS' INSTITUTION.

AT the first meeting of the session, held on Monday, the president, Mr. Christopher Oakley, read his opening address before a full gathering of the members. He referred first to the fact that of all the Council who governed the affairs of the Institution in 1868, its first year of existence, but two members now survive, Mr. R. C. Driver, of Whitehall, and Mr. W. Sturge, of Bristol, and strongly recommended the younger members to read the addresses of some of the former presidents, as containing much wise and valuable advice, and emphasising the fact that the success of the Institution depended on the conduct, influence, and co-operation of the individual members. There had been, he said, very little legislation during the past Session of Parliament which nearly affected the surveyors' profession. The Extraordinary Tithe Act settled some doubtful points in previous Acts. The Market Gardens (Scotland) Act and the County Dublin Surveyors' Act did not materially affect them. The Public Offices Act authorised the purchase of the site of premises on

the north side of Lord Carrington's House, and other premises in Whitehall Place, for the purposes of a new War Office. This clearance would, he thought, increase the difficulty and cost of obtaining offices in Westminster. The Agricultural Rates Act, 1896, had given rise to much discussion, and there was still a good deal of uncertainty as to what was "agricultural" land and what was not, and some dissatisfaction among the clergy that tithe and rent charge should not be allowed the relief afforded by the Act to other incomes arising out of the land. The recent book of the Duke of Bedford's "The Story of a Great Agricultural Estate," showed that on one estate of 32,000 acres the expenditure, in seven years out of twenty since 1876, exceeded the income by some £39,000, while another estate showed a deficiency of nearly £10,000 in five years. This seemed, he thought, conclusively to show the inadvisability of breaking up large estates to form small ones, for the supposed benefit of the community. The President next dealt at considerable length with the Report of the Royal Commission on Agriculture, and after setting forth in some detail some of the facts contained in the report and the evidence, briefly condensed the conclusions of the Commissioners into the following:—1. That the fall in prices owing to foreign competition has caused the present grave state of affairs. 2. That they found no prospect of any material relaxation of this competition. 3. That we must look forward to a further reduction of land susceptible of arable cultivation at a profit, with a corresponding contraction of production, and diminution of our rural population. Referring to the effect of agricultural depression on property sales, the register of sales kept at the London Auction Mart showed that in the years 1875, '85, '94, '95, and '96, the sales of landed properties over 100 acres and upwards outside London amount respectively to 96,000, 31,000, 11,500, 36,000, and 77,600 acres, at prices averaging respectively 52s., 32s., 25s., 19s., and 25s. per acre. The sales of freehold ground rents registered during each of the same five years, amounted respectively to £9,500, £12,000, £13,500, £18,000, and £25,000, the average number of years' purchase being respectively 26½, 27½, 28, 30½, and 33½ years, which at all events showed that there were still persons who thought such investments worth a high price as securities. The London County Council in their Improvements Act, 1897, obtained the sanction of Parliament to three schemes of street widening—viz., the Strand and Holywell-street scheme, that for widening the southern end of Tottenham Court-road, and that for a new street in connection with the northern approach to the Tower Bridge. Into all these the principle of "Betterment" coupled with "Worsenment" entered, under different modifications. In conclusion, the President referred to the new institution buildings in Great George-street, which, under the supervision of the architect, Mr. Alfred Waterhouse, R.A., were now making rapid progress, and he expressed a hope that some part at least might be available early next summer.

A vote of thanks having been moved by Mr. E. P. Squarey, and seconded by Sir Henry Cartwright, and carried unanimously, the meeting adjourned.

NOTES ON SURVEYING AND LEVELLING.—V.*

By WALTER TESTER.

SETTING-OUT THE BASE OF THE TOWER.

THIS article will be devoted to the setting-out of the base of the steel tower, octagonal on plan, the eight main pillars of which come down one just inside each of the corners of the octagonal-shaped building dealt with in the last article.

The plan and elevation, Figs. 1 and 2, show the section of the main pillar, and the detail of the base and holding-down bolts. The bases are 9ft. by 10ft., and there is to be 14ft. by 14ft. of concrete underneath the latter, at least 4ft. 6in. thick, or more if the rock at that level is not perfectly sound.

As soon as the excavations for the basement floor of the building are sunk down to 49.62 level (as described in the last article), the holes for the concrete can be marked out. The dimensions required for this purpose are given on the accompanying elevation, Fig. 2, together with

FIG. 1.

certain others that will be required for setting-out, and it will be as well in this place to explain how they are arrived at. Of course, the general dimensions of the tower have already been settled, and the surveyor is supplied with the following particulars:—Rake of the pillar, 12° 15' 13" out of vertical; width across the tower on a diagonal line at the 60.00 level (above Ordnance datum), 132ft. 9in. to the inside of the pillar; half-width to the centre of the octagon, 66ft. 4½in.; horizontal width of the pillar, 4.0112ft. Now let us take any right-angle triangle, A B C, having an angle of 12° 15' 13", as sketch, Fig. 3.

$$\begin{aligned} \text{Angle A} &= 12^\circ 15' 13'' \\ \text{B} &= 77^\circ 44' 47'' \\ \text{C} &= 90^\circ 0' 0'' \end{aligned}$$

$$\text{Total} \dots 180 \quad 0 \quad 0$$

$$\text{Then—} \quad \text{Sin. A} \times \text{AB} = \text{BC}$$

$$\text{And—} \quad \text{Cosin. A} \times \text{AB} = \text{AC.}$$

Then, from the Tables—

$$\text{Sin. } 12^\circ 15' 13'' = .2122393$$

$$\text{Cosin. } 12^\circ 15' 13'' = .9772177$$

That is supposing we have the long dimension A B; A C is found by multiplying it by .9772177, and B C by multiplying it by .2122393. Now the dimension of the tower on a diagonal line at 60.00 level being 66ft. 4½in. = 66.375 from the centre point to the inside of the pillar + 4.0112 = 70.3862 to the front angle, and the length on the rake to the underside of the 4ft. 6in. of concrete from the point where the 60.00 level cuts the front angle of the pillar is—

$$\begin{aligned} 13 \frac{1}{2} \\ 4 \frac{1}{2} \end{aligned}$$

$$= 17 \frac{7}{8} = 17.875$$

$$17.875 \times .9772177 = 17.438 \text{ vertical}$$

$$17.875 \times .2122393 = 3.7451 \text{ horizontal.}$$

$$\begin{aligned} 60.00 & \quad 70.3862 \\ 17.438 & \quad 3.7451 \end{aligned}$$

$$\begin{aligned} 42.562 & \quad 74.1313 = 7 \text{ft. } 1 \frac{1}{8} \text{in.} \end{aligned}$$

In a similar way the dimension from the centre of the octagon and level of the front angle of the pillar (produced) can be calculated for any depth necessitated by a greater thickness of concrete than 4ft. 6in., on account of the rock not being perfectly sound; also the levels of the top and bottom edges of the 14ft. width of concrete; the triangle formed by the rake of the bottom of the concrete with horizontal and vertical lines being similar to the one we have just been dealing with

—viz., the one formed by the line of the rake of the pillar with vertical and horizontal lines—that is, they both contain the same angles; all that is necessary being to multiply the longest side of the triangle by .9772177 and .2122393 for the other two sides. In the same way the dimensions and levels at the top of the concrete are calculated. They are given on the accompanying elevation (Fig. 2), but sufficient has been said to explain how they are arrived at, and it is not necessary to give the calculations in detail.

The surveyor is now in a position to proceed with the marking out of the holes for the concrete, and it will be assumed that the centre point of the octagon used for setting-out the building has been retained, and that the brick pier on which it is marked with a nail, is standing up three or four feet above the basement formation level, so that by tilting the telescope of the theodolite down, the surveyor can command a good view into the farthest side of the hole in which the tower base is to be placed. The radial lines used for setting-out the octagon of the building are also retained. The surveyor should check each one of these by again setting out the angles 22½°, 67½°, 112½° off the axis line, as explained in the last article.

Having set out the radial line for one of the holes, he can measure out the lengths 64ft. 4½in. and 79ft. 0½in., and two lines square off at these points and 7ft. out each side will define the position of the hole. The hole being in this way marked out on the basement floor formation level, the excavator can proceed to sink it down to the required depth (see Fig. 2), and in order that there shall be no mistake, the surveyor should put in a nail at each corner of the hole with his level, say, at 48.00; two measuring staves should then be made, of such a length that when they are placed underneath the nails and fixed vertical with a plumb-bob, they will give the depth to be excavated to. One of these staves will be perfectly straight, and 4ft. 2½in. long (48.00 less 43.82); but the other one will require to have a return piece square off at the top and 1½in. long (65ft. 4½in. less 64ft. 4½in.), the length of the other portion being 7ft. 1½in. (48.00 less 40.85), and it should also have the length 2ft. 9in. (48.00 less 45.24) marked on.

Assuming that the rock is perfectly sound at this level and cut to the correct rake, the surveyor must next mark out the position for drilling the four holes for the holding-down bolts, and for this purpose a wooden template (see sketch, Fig. 4) is provided by the maker of the steelwork

* The illustrations by kind permission of Messrs. Maxwell and Tuke, the architects and engineers.

FIG. 2.

with holes cut in it corresponding to the ones made in the steel bases, and also with the front angle of the pillar, and the radial line marked on it. Having set out the requisite angle, the surveyor should have a board fixed by nailing to the rock on his radial line at each side of the hole, standing up above the formation level to the height of his centre point. On each board he should mark the exact position where his line cuts, by

FIG. 3.

FIG. 4.

means of the theodolite, and have a saw-cut made at these points in the boards. A string line can then be fixed over the centre nail and through the saw-cuts in the boards, and will, in this way, be kept perfectly level and truly on the line, and prevented from swaying over the hole. He should now measure out carefully with his steel tape, from the centre point, the dimension 74ft. 1 1/2 in. (for 4ft. 6 in. of concrete, or the corresponding one for any other thickness), and put a pin in his string-line to the exact measurement. This point can now be carefully plumbed down into the bottom of the hole, using a heavy plumb-

bob. Having marked this point with a nail driven into the rock, he should fix the front angle point of the template exactly at the spot, and in order to get it truly on the diagonal line, he must

plumb another point down off his string line, which must coincide with the line marked on the template. The exact centre point of each of the four holes for holding-down bolts can then be marked with a nail, and the template can be removed. Four nails should be driven into the rock around each centre, sufficiently away from it to prevent them being disturbed by the drilling operations, and in such a position that diagonal lines between them will cut at the exact point. The four holes being marked, the drilling machine can be got to work, the angle at which the drills work being set with a template provided for that purpose, which is merely like a large set-square having angles of 12° 15' 13", 77° 44' 47", and 90°. (See sketch, Fig. 3.) The best way to use it is to set the side A C perfectly vertical with a plumb-bob; the side A B will then be at the required rake. After the holes for holding-down bolts are drilled down to the required depth in the rock, a boxing is fixed over each hole at the proper rake, and sufficiently long to go through the concrete, being well stayed to

the sides of the hole with timber to prevent it from being disturbed.

The four boxings being fixed, the concrete can then be put in, and the next thing requiring consideration is finishing the top surface of the latter, which requires to be done with considerable accuracy. The method adopted at New Brighton was as follows:—Around the sides of the hole were fixed timbers exactly at 48·50 set carefully with the level. (See sketches, Figs. 5 and 6.) A template was made as sketch, Fig. 6, of the exact length and depth, to finish the surface to the required level, and so as to work along two cross-pieces, shown on the sketch, the template being kept square with the latter by means of

FIG. 5.

guide pieces as shown. These cross-pieces were fixed to the exact dimensions required measured out in a similar way to that already described for fixing the template for holding-down bolts. The template serves for all the eight holes, which are dealt with in every particular as described. When the concrete is sufficiently set, the boxings can be removed, and the holding-down bolts placed in position. The first portion of the pillar comes on to the works separate from the base and brackets; but they are all riveted together up to the first joint in the pillar just over the hole, and when ready are lowered on to wedges at the four corners of the base, arranged for adjusting the levels of the tower. The bases must be exactly correct in position, and in order to attain this end the brick pier on which is marked the centre of the octagon is built up, perhaps 15ft. or 20ft. high, with a platform round the top for the surveyor, so as to get a view with the theodolite on to the surface of the concrete at the side nearest the centre point. The nail at the lower level is not disturbed and the pier is built hollow, and with eight holes at the bottom on radial lines, so that the tape can be hung on to the centre nail. The centre point is plumbed up from the nail on to the higher level, and a plate as sketch Fig. 7 is fixed.

FIG. 6.

This plate has a centre-piece screwed to fit the theodolite, and also three adjusting screws for setting level, and must be fixed with its centre exactly coinciding with the centre of the octagon.

FIG. 7.

The theodolite is screwed to this plate instead of to the legs in the ordinary way, thus saving time in fixing, and, as the plate cannot move, insuring its being always at the same point. The position where the radial line cuts is marked on the steel

base-plate and on the pillar, and the base must be fixed so that these marks coincide with the vertical hair of the theodolite, the angles being set out as already described; also it must be perfectly true to measurement from the centre of the octagon, the dimensions being set out as before. The central pier is retained until the tower is up to the first girder level, the pillars all being set exactly on the radial lines with the theodolite, and when the tower is complete up to this height it can be checked, to see that it is perfectly vertical and level, and adjusted by means of the wedges on which the bases are built. Being now as near perfect as possible, the holding-down bolts can be run in, also the $\frac{1}{4}$ in. thickness of cement under the bases, and everything fixed, concrete being eventually filled in the holes up to the basement floor level.

PAINT-MIXING

IS not an every-day art. There are scores of provincial small master-painters who follow the time-honoured rule-o'-thumb method of mixing their own paint—a wooden keg, with a piece of coarse canvas stretched across its top, still meeting all their requirements for paint. Whether this old-fashioned method be followed, or the more up-to-date one of grinding up the paint in a colour-mill, neither process helps the beginner in knowing what colours to blend to produce a certain tone of colour or match any particular hue. This part of the paint may, however, have to be acquired by long practical experience; but to be up-to-date, a much faster plan is to employ one's spare time in making experiments on the following lines, and jotting down the results in a notebook especially reserved for the purpose. Select a definite quantity—say 1 oz. of each of the pigments, in dry powder, of which the particular shade of colour is composed. Take up a little of each colour on the top of the palette-knife, rub them up together on a piece of thick glass—placed over a sheet of white note-paper—or else on a china slab. Drop a few drops of linseed-oil on the dry pigment mixture, and rub up the whole until of a homogeneous compound. Note whether the hue of the mixture thus made matches the one desired, and if not, add a little more blue, yellow, or other pigment required to produce the particular tone or shade required. When you have matched the particular colour desired; weight of the remainder of each batch of dry colour, and also note how much oil has been used to bring the mixture to the right consistency.

For example.—Suppose you want to match a light French grey tint, the compounds of which you know to be white-lead, ivory black, orange chrome yellow, you will start by taking about equal bulks of the black, yellow, and white. On mixing these you will at once be struck with the fact that the compound is too yellow, not black enough to produce a suitable grey. You therefore increase the amount of the black and also the white; the mixture is much too dark, so you keep on adding more and more white, until you have produced the exact light tint required, adding oil as required; but do not make the mixture too sloppy—only just the stiff consistency an oil paint would be when used. On weighing the dry colours you find that for every one grain of orange chrome yellow used you required two grains of ivory black and 480 grains of white lead. You also note that out of the ounce bottle of linseed oil you have used a little more than one half. Put the remainder of the oil into a graduated glass measure, and the number of minims used will show the number of parts of oil required—e.g., 480 parts of dry white-lead, 2 parts of ivory black, 1 part of orange chrome yellow, 280 (about) parts of oil; these proportions are for best quality pigment unadulterated. For impure badly-coloured pigments the proportions of them would vary slightly from the above. On making a medium French-grey tint, you would note that only half the above quantity of white-lead would be required. Although you are here only working in grains, all that you have to do, after working up bulk quantities, is to make the lb. a cwt., the units in proportion. To find the quantity of oil needed, calculate the percentage amount required in compounding the experimental sample, then 280 minims out of 1 fluid oz. of oil equals that 57 per cent. of the oil was required to commingle the pigments. When you find out the proportions of any particular colours stated in the following

formula do not give the prescribed hue, you may not unreasonably suspect that some one or other of the pigments are adulterated, and therefore the suspected sample should be assayed or compared with a standard pure colour. The assay should be made for intensity of staining power, opacity or covering power, and unctuousity or power of combining with the oil vehicle. These tests are made as follows: To assay for staining power, take equal weights of the suspected pigment and of a pure one, and also the proper quantities of dry white-lead; mix one lot of white-lead with the suspected pigment, and the other lot of white-lead with the genuine sample that is to be used for comparison; put an equal number of drops of oil to each mixture, and rub them up separately on a slab of white porcelain, then compare the two mixtures. If the suspected sample is weaker in tone than the genuine one, you have good grounds for supposing that it is not a pure pigment.

To assay for covering power, take equal weights of the suspected pigment to a sample of genuine ditto; add an equal amount of oil to each, and rub the colour up on a piece of glass. Rub each sample of colour out to cover as large a surface as it will without actually showing the glass beneath. Measure the difference between the extent of surface covered by each sample. That which covers the larger surface without losing its opacity possesses the greatest covering power. The opacity may be determined by holding the piece of glass up to the light, or by placing a sheet of coloured paper beneath the glass, on which the colour is rubbed out, and noting any difference or modification in hue that is produced by the coloured paper.

To ascertain the unctuousity of the pigment, or its capacity to combine with oil, take equal weights of the suspected and a genuine sample of pigment; add an equal number of drops of oil to each pigment, and rub them up separately, and compare the consistency of each sample. The stiffer the consistency, the greater is the capacity for combining with oil.

The bottle or vial which holds the oil should be of a known capacity, and be fitted with a cork, down the side of which is a V-shaped slit cut. This will permit the oil to flow out at a uniform rate in drops. The specific gravity of a pigment is no criterion as to its genuineness or freedom from adulteration.

In mixing paint by the old-fashioned method of straining through canvas over the mouth of a keg or tub, it is usual to use white-lead already ground in oil, and to dilute this with oil and add the staining colours, and mix the two by rubbing the pigment and oil in coarse canvas by means of a brush. As only a pound or two of colour can be worked up at a time, this is a very tedious way of colour-mixing, and inducive to laziness on the part of the operative.

If a hand or power colour-mill be used, it is best to mix up the staining colours in a little oil or turps before mixing with the white-lead. This mixing should be done on a stone slab, with a stone or glass muller. The number of turns the colour is put through the mill will depend on the importance of the work in which it is to be used, and also on the nature of the paint compound. Some pigments require a great deal more grinding and mixing than others.

RECIPES FOR MOULDING COLOURS.

All parts by weight, fluids by fluid measure, unless otherwise stated. No classification is made as to cost price of each paint compound.

POSITIVE COLOURS: REDS AND THEIR ALLIES.

- 1.—Vermilion: 3 parts English vermilion, 1 part orange mineral.
- 2.—Scarlet vermilion alone.
- 3.—Deep scarlet: 8 parts vermilion, 1 part white-lead.
- 4.—Light scarlet: 20 parts vermilion, 1 part golden ochre, 7 parts white-lead.
- 5.—Crimson: 25 parts Indian red, 7 parts crocus mantes, 6 parts oxide of zinc, 6 parts whiting.
- 6.—Light red: bright red oxide of iron.
- 7.—Blood red: 15 parts crocus mantes, 10 parts whiting, $\frac{1}{2}$ part peroxide of iron ore (hematite), 1 part Venetian red, 3 parts silica.
- 8.—Cherry red: 2 parts English vermilion, 1 part carmine.
- 9.—Turkey red (paint): 56 parts light red oxide, 126 parts precipitated barytes, 28 parts Paris white, 23 parts boiled oil (to make it into a paint).

- 10.—Deep crimson: 2 parts carmine, 1 part vermilion.
- 11.—Oriental red: 2 parts Indian red, 1 part red-lead.
- 12.—Brick red: 1 part Venetian red, 4 parts white-lead.
- 13.—Tuscany red: 8 parts Indian red, 1 part rose pink.
- 14.—Indian red: 3 parts Indian red, 5 parts native barytes, 1 part Paris white (2 to 3 parts boiled oil to form a paint).
- 15.—Armenian red: 2 parts Venetian red, 1 part yellow ochre.
- 16.—Mexican red: 4 parts Venetian red, 1 part red-lead.
- 17.—Deep Indian red: 16 parts Indian red, 1 part lampblack.
- 18.—Moorish red: 3 parts aniline vermilion, 1 part rose pink.
- 19.—Red oxide of iron (paint): 3 parts red oxide of iron, 6 parts native barytes, 1 part Paris white (2 to 3 parts boiled oil).
- 20.—Pink, light: 24 parts white-lead, 1 part vermilion.
- 21.—Pink, bright: 24 parts white-lead, 1 part orange mineral.
- 22.—Pink, Venetian: 20 parts white-lead, 1 part Venetian red.
- 23.—Pink, Indian: 40 parts white-lead, 1 part Indian red.
- 24.—Pink, royal: 2 parts zinc-oxide, 1 part carmine lake.
- 25.—Pink, coral: 5 parts white-lead, $1\frac{1}{2}$ parts vermilion, 1 part orange chrome yellow.
- 26.—Pink, shell: 50 parts white-lead, 2 parts vermilion, 1 part orange chrome, 1 part burnt sienna.
- 27.—Orange: 1 part white-lead, 1 part orange mineral.
- 28.—Pink, Venetian (paint): 11 parts Venetian red, 1 part red oxide of iron, 24 parts native barytes, 8 parts Paris white, $6\frac{1}{2}$ parts boiled oil.
- 29.—Pink, geranium: 60 parts zinc-white, 1 part geranium lake.
- 30.—Pink, flesh: 120 parts white-lead, 2 parts yellow ochre, 1 part Venetian red.
- 31.—Pink, carnation: 16 parts zinc-white, 1 part rose madder.
- 32.—Pink, carnation: 12 parts white-lead, 1 part scarlet lake.
- 33.—Pink, carnation, rose: 16 parts white-lead, 1 part rose-pink.
- 34.—Pink, rose: 16 parts zinc-white, 1 part Munich lake.
- 35.—Pink, rose, pale: 32 parts zinc-white, 1 part Florentine lake.
- 36.—Pink, rose, deep: 8 parts zinc-white, 1 part Victoria lake.
- 37.—Pink, rose royal: 16 parts white-lead, 1 part rose lake.
- 38.—Pink, salmon: 60 parts white-lead, 4 parts vermilion, 1 part lemon chrome.
- 39.—Pink, salmon: 36 parts white-lead, 4 parts golden ochre, 1 part Venetian red.
- 40.—Pink, fawn: 24 parts white-lead, 3 parts golden ochre, 1 part vermilion.
- 41.—Pink, terracotta: 2 parts white-lead, 1 part burnt sienna.
- 42.—Pink, terracotta tint: 20 parts white-lead, 1 part terracotta.
- 43.—Pink, Indian: 40 parts white-lead, 1 part Indian red.
- 44.—Pink, royal: 2 parts zinc-white, 1 part crimson lake.
- 45.—Pink, opaque: 32 parts white-lead, 1 part red lead.
- 46.—Pink, transparent: 32 parts zinc-white, 1 part rose madder.
- 47.—Pink, coral tint: 15 parts white-lead, 1 part deep aniline vermilion.

VIOLETS, PURPLES, LILACS, AND LAVENDER HUES.

- 48.—Lilac: 30 parts white-lead, 1 part madder lake, 1 part ultramarine.
- 49.—Lilac, rich: 64 parts zinc-white, 1 part mauve lake, 1 part madder lake.
- 50.—Lilac, purple: 16 parts white-lead, 1 part cobalt blue, 1 part carmine lake.
- 51.—Lilac: 40 parts white-lead, 1 part rose pink.
- 52.—Lavender: 16 parts zinc-white, 1 part mauve lake, 2 parts rose madder.
- 53.—Lavender: 88 parts zinc-white, 3 parts ultramarine, 1 part carmine.
- 54.—Lavender: 48 parts white-lead, 1 part ultramarine, 1 part rose pink.
- 55.—Purple: 4 parts zinc-white, 2 parts ultramarine, 1 part carmine.

- 56.—Purple, deep: 3 parts white-lead, 1 part ultramarine, 1 part rose pink.
 57.—Purple, royal: 4 parts white-lead, 2 parts cobalt blue, 1 part carmine lake.
 58.—Purple, slate grey: 60 parts white-lead, 3 parts ultramarine, 1 part Indian red.
 59.—Purple, transparent: 1 part cobalt ultramarine, 1 part carmine.
 60.—Purple, transparent violet: 4 parts ultramarine, 1 part crimson lake.
 61.—Purple, opaque violet: 6 parts white-lead, 3 parts ultramarine, 3 parts rose lake, 1 part ivory black.
 62.—Purple, mauve: 12 parts zinc-white, 4 parts cobalt blue, 1 part carmine lake.
 63.—Terracotta red: 1 part white-lead, 1 part burnt sienna.

(To be concluded.)

A FARE CHANCE FOR ARCHITECTS.

THE prospectus of the Phebe Hearst Scheme for the University of California has been issued by the trustees at San Francisco, giving the architectural profession such a chance to distinguish themselves as is not likely to occur again. The Governor of the State is the Chairman of the Trustees; one of the Board of Regents and one of the Professors of the Faculty represent the University. Mrs. Phebe A. Hearst, widow of the late United States Senator, Mr. George Hearst, has provided ample funds for the competition, and the site is described as "the most beautiful site on earth for the purposes of a university." The architect of such a home as the promoters contemplate for this university, which is to become one of the great seats of learning of the world, "will make his name imperishable." "There are to be no definite limitations of cost, material, or style. All is to be left to the unfettered discretion of the designer. He is asked to record his conception of an ideal home for a university, assuming time and resources to be unlimited. He is to plan for centuries to come." "In fact it is a city that is to be created—a city of learning—in which there is to be no sordid or inharmonious feature." "It is seldom in any age that an artist has had such a chance . . . with such an entire exemption from the influence of discordant surroundings." There are to be 28 buildings at least, and about five million dollars have already been pledged for a beginning. The University was founded in 1862. The charter was given by the State in 1868, and its income is augmented by the Government. It is thus National, and its present resources are valued at nine million dollars, in addition to an income of 40,000dol. from the United States and of about 250,000dol. from the State tax. The site includes 245 acres, and is at Berkeley, where it covers an area more than 700ft. in altitude, with a superb outlook over the bay and city of San Francisco. Maps, charts, and photographs are to be supplied. Ample prizes are offered. There are to be two contests. Here, then, is the chance free to all talent to win the day. Apply to the Trustees, 217, Sansome-street, San Francisco, California.

LONDON RIVERSIDE CHURCHES.*

THIS is a companion volume to the author's "London City Churches," which we noticed some time ago. Mr. Daniell here describes the most noteworthy churches "situated on or near the banks of the Thames between Kingston on the west and Greenwich on the east, omitting those within the city boundaries," before described. The book is illustrated by over 300 views by Alexander Ansted. Some of these are sketched in a free and spirited style, but rather too small to be of much value. Others are more suitable for vignettes. Mr. Daniell is descriptive and historical. The leading peculiarities of the edifices from an architectural point of view are briefly pointed out, together with the names of great men who find resting-places in these interesting churches, and of their monuments. It is mainly in this latter regard that the author's book will be found of service as a guide. Such names as Sir Thomas More, Fletcher, Massinger, Andrewes, Raleigh, Caxton, Blake, John Evelyn, Gulliver, Dr. Johnson, Charles Dickens, Hogarth, Gainsborough, and Theodore Hook give an abiding interest to the

edifices. It would be impossible to give the reader any idea of the number of buildings described. Of course, the larger part of these churches are of quite modern date, like that of St. Mary Magdalene, Richmond, which, with the exception of the old battlemented tower of flint and stone, is of brick of Classic design; so, also, is that of St. Mary, Twickenham, but both have many associations and interesting monuments. St. Anne, Kew, is another 18th-century church of Queen Anne character, with a Doric portico. St. Paul's, Hammersmith, is shown by two views. The old demolished building had a picturesque tower with lantern; the new edifice (1882) is of Early English character, but of little architectural interest. A characteristic 18th-century church is that of St. Mary, Battersea, which has a steeple of some picturesqueness seen from the river. St. Mary, Lambeth, has also a picturesque tower from the Thames; but the church was rebuilt by Philip Hardwick in 1850. Good sketches accompany the descriptions of St. Mary-le-Strand, the best of Gibbs's churches, and of St. Clement Danes, by Sir Christopher Wren; but the illustrations of St. Saviour's, Southwark, do inadequate justice to the restored church. The south view is meagre. Other interesting churches noticed are St. George's-in-the-East, by Hawksmoor; St. George's, Southwark; St. Alphege, Greenwich, by John Webb, one of Inigo Jones's pupils; St. Anne, Limehouse, by Hawksmoor, the latter of interest for its Classical steeple of pleasing and broken outline; St. Paul, Deptford; and All Saints', Poplar. All these churches are of Classic design, and particularly interesting as examples of 18th-century architecture. Not possessing any pretensions to architectural style, but rather as having an historic and monumental interest, these riverside churches must be accepted, and Mr. Daniell has brought together, in a summarised and interesting form, all the literature and records that throw light upon his subject.

CHIPS.

A new Baptist chapel at Cwm, Churchstoke, Salop, was opened last week. The builders were Messrs. E. Davies and Son, of Newton, Mont.

The Local Government Board have appointed Mr. H. E. Greene, Q.C., M.P., arbitrator in disputes under the Housing of the Working Classes Act, 1890.

A new building, comprising stockroom, workroom, and bedrooms, has been added at the rear of the drapery premises of Messrs. F. Corder and Son in Tavern-street, Ipswich. Mr. J. Shewell Corder is the architect and Messrs. T. Parkinson and Son, of Ipswich, are the builders.

In the case of J. Blackman, of Catford, S.E., builder, the order of discharge from bankruptcy has been suspended for two years, ending July 30, 1899.

At the annual meeting of Greenock Dean of Guild Court, Dean McGregor reported that during the year 623 cases were considered, comparing with 757 last year. The probable total cost of the buildings, additions, and alterations for which plans were passed amounted to £75,755, against £83,000 last year, which, however, was a record year. The total number of plans passed was 136, of which 13 were for villas and cottages, 14 for tenements, 23 for business or other premises, and 96 additions or alterations.

It has been finally decided to build the new Royal Infirmary for Newcastle-on-Tyne, upon a site of ten acres on the Castle Leazes given by the city council. The cost of this hospital, about £100,000, will be borne by Mr. John Hall, a local ship builder, and the site of the present infirmary will presently be handed over to the corporation.

Mr. Clement C. R. Spelman, a member of the firm of Messrs. Spelman, valuers and estate agents, has been elected as Mayor of Norwich.

The Forestry Department of Western Australia report that negotiations have been entered into between parties in Italy and at Perth, W.A., with a view to the opening of trade in Australian timbers. A Hamburg merchant is also inspecting the timbers with the idea of making purchases for the German market.

Improvements have been effected at the Halifax parish church. Additions have been made to the organ. Electric lighting has been provided in the church, the installation having been made by Messrs. Dixon and Sons, Boar-lane, Leeds, and the supply is drawn from the corporation mains. The reopening services begun on Saturday.

Eddleston parish church was reopened on Sunday. It is almost a year since the interior of the church was completely gutted by fire, only the walls being left. The restoration has cost about £1,160.

COMPETITIONS.

BIRMINGHAM.—The report of the Lunatic Asylum Committee, that they had selected six firms of local architects to engage in a limited competition for the proposed asylum at Holly Moor, Northfield, each firm to be paid a fee of a hundred guineas, led to an animated discussion at the meeting of the city council on Tuesday; but it was eventually adopted, with an addition, binding the committee to call in an independent architect as assessor. The newly-elected Lord Mayor severely rebuked Mr. Stenbridge for asserting that it was a foregone conclusion that the plans of Martin and Chamberlain (who were originally recommended as architects for the building, and are one of the six firms invited to compete) would be accepted. Mr. Stenbridge withdrew the remark, but gave notice of motion that two other architects—Messrs. Essex Nicol and Goodman and Mr. W. Henman, the designers respectively of the new meat market and new hospital—be added to the half-dozen invited to send in plans. We gave the six names of firms last week, p. 651.

BURY, LANCS.—The designs of Messrs. Woodhouse and Willoughby, architects, of 100, King-street, Manchester, have been accepted for the erection of the Bury Art Gallery and Public Library. The chief purpose of the building is to house the Thomas Wrigley collection of pictures and statuary, valued at from £60,000 to £100,000, which was given to the town as a Diamond Jubilee memorial. We shall illustrate shortly the selected design, which is English Renaissance of the 18th century in character, and is to be faced with stone.

HARROGATE.—A site has been secured for a new technical school for Harrogate at the junction of Bower-road and Hayura-crescent, and the committee have decided that local architects be invited to send in competitive designs, for which prizes of £20, £10, and £5 will be offered. The instructions provide that more attention shall be devoted to the interior of the building than to external ornamentation. The chief room is to be at least 45ft. by 35ft.; whilst a number of smaller rooms are to be provided. It is desirable that a large room should be available for conversaciones, &c., and it is suggested that the elementary, building, and lecture-rooms should be so designed as to be convertible into one large room. The building will be two or three stories high, and must be so arranged as to allow for extension if necessary. The building proper will be of stones and the cost is not to exceed £3,500.

HARRISBURG, PA.—The Pennsylvania State Capitol Commissioners have selected Mr. Henry Ives Cobb, of Chicago, as architect of the new building to be erected at Harrisburg. Whether the courts will allow him to carry out his design is not yet settled, but he has been instructed to prepare working drawings at once.

IPSWICH.—The school board received at their last meeting a report by a committee on the six sets of plans sent in by local architects for the new higher grade school to be built on the Tower House property. Mr. E. R. Robson, architect to the education department, has been appointed assessor, and it was resolved that the authors of the plan he selected should be appointed as architect of the new higher grade school. On opening the envelope which accompanied the plans recommended for adoption, the authors turned out to be Mr. J. S. Corder and Mr. W. Brand, of Ipswich.

WOLVERHAMPTON.—The committee formed for providing a new free library by voluntary efforts have selected Mr. Waterhouse, R.A., as assessor to decide on the competitive plans to be sent in by twelve architects for the new building. Owing to an extension of the site, the architects are given until February 14 next to send in the plans. The cost is estimated at £10,000.

A Local Government Board inquiry has been held at St. Stephen's-by-Saltash relative to an application to borrow £2,000 for works of sewerage at Burraton. Colonel A. Smith held the inquiry, and very little opposition was offered.

Mr. R. H. Jeffes, an assistant in the office of the surveyor and water engineer to the Tottenham Urban District Council, has been appointed assistant on new streets, sewers, buildings, &c., in the urban district of Esher and The Dittons, under Mr. A. J. Henderson, A.M.I.C.E., engineer and surveyor to that council.

Building Intelligence.

BENWELL.—The foundation-stone of an English Presbyterian church was laid at New Benwell, near Gateshead, on Wednesday in last week. It is being built from plans by Messrs. Badenoch and Bruce, of Pilgrim-street, Newcastle-on-Tyne, the builder being Mr. Thomas Hunter, of Washington, Co. Durham. The hall occupies the eastern portion of the site, and between the church and hall the classrooms and vestries are placed. The church is planned with nave and aisles, the aisles and west end having galleries, the whole providing seating accommodation for 650. The floor has a fall of 9in. in the length; the pulpit and communion platform are at the east end, and the west gallery has been reserved as the organ chamber. The fall of 16ft. in the length of the site is utilised to get the caretaker's house, tea-room, heating chamber, and coals under the hall and classrooms, but entering off the back street. On the same level as the church, and immediately behind, are placed the minister's vestry, a room for ladies, and a small hall for prayer meetings, and infants' class, and a flight of short steps leads to the large hall, with accommodation for over 400. The first floor over the vestries is occupied by three classrooms. The whole block is designed in the Early English style; the walling is of local stone, in coursed rock facing, with chiselled stone dressings, the bays of the nave having buttresses at every principal, and the alternate bays having the upper windows carried up as dormers. Internally, the nave is divided from the aisles by an arcade of five bays on either side. The roof and internal fittings, gallery front, and pews are of pitch-pine, the ceilings being of pitch-pine cleaving in narrow widths, formed into panels with mouldings planted on. It was found necessary to go down about 16ft. all along the west front to secure a suitable foundation. To overcome this difficulty concrete piers were carried down to the required depth, the spaces between being bridged with concrete blocks about 4ft. wide and 2ft. thick, in which rolled steel girders are embedded to strengthen the concrete and tie the piers together. The foundations throughout are of Portland cement concrete, and are taken down to the clay.

BRADFORD.—A new Theatre of Varieties, of large and attractive proportions, is about to be erected in this town on the site of the Alexandra Hall, stabling, and vacant land adjoining, in Horton-lane, containing an area of 4,400 yards. Mr. W. G. R. Sprague, of London, is the architect. The building is to be of concrete and steel. The auditorium will accommodate 3,000 persons, and electric lighting and low-pressure hot-water heating will be adopted. It is not proposed to entirely demolish the hotel. Of its 140 bedrooms, 82 will be retained, but the hotel will have no connection with the theatre. A new front will be given the structure, one feature being a colonnade on the ground level. A search-light will be fixed aloft. The entrance to the theatre will be through lobbies opening into a vestibule 45ft. square, the roof of which will be carried by twelve marble columns with carved caps. It will be lofty and decorated in the Arabesque style. The vestibule, by two short flights of white marble steps, will give access to the grand circle, boxes, and fauteuils. The theatre will also be decorated in the Arabesque style, and 2,000 16c.p. electric lamps will illuminate the interior. Saloons, retiring-rooms, and lounges are to be provided for each section of the auditorium. The house will be built on what is known as the two-tier system—viz., fauteuils, stalls, and pit on the ground floor; grand circle and boxes on the first tier; balcony and gallery on the second tier.

BYKER-ON-TYNE.—A new board school at Baby-street, Byker, was opened last week by the Mayor of Newcastle. The design and arrangement are on the "central hall" principle. The halls on each floor are 73ft. by 30ft. Opening off the main hall on the ground floor seven classrooms are arranged, each 26ft. by 24ft., and separated from the main hall by glazed screens. The first floor is similar to the ground floor. Each set of desks is lighted from the left hand of the pupils. Between the entrance doors and central hall cloakrooms are designed, fitted with requisite cloak-horses and lavatories. Next to the main entrances are arranged at each end three rooms for teachers (six in all) with lavatory accommodation. The infants' school is designed as a one-story building, the central hall being 62ft. by 32ft.,

with desks for one class. Off this main hall are seven classrooms with glazed screens as in main school. All walls are lined throughout to a height of 4ft. with glazed bricks. The caretaker's house is in the centre of the site. The accommodation is for 1,540 children. The total outlay will be about £12,950. The contractor is Mr. Thomas Hunter, of Washington. The clerk of the works is Mr. Boocock, and Mr. W. Lister Newcombe, F.R.I.B.A., of Newcastle, is the architect.

EDINBURGH.—The Edinburgh District Lunacy Board has just purchased the estate of Wester Bangour, by Uphall, extending to 861 acres, for £13,000, as the site for a new asylum. The District Lunacy Board have during the last few months had under their consideration the character of buildings to be erected for the accommodation of about 600 patients, and appointed a deputation to visit the principal asylums in England and the Continent and to report. The deputation visited a number of asylums on the Continent and in England, and returned impressed with the conviction that the system adopted at Alt-Scherbitz, near Leipzig, was the best they had seen, and the one which Edinburgh should adopt. The Alt-Scherbitz system is the segregated or village type of asylum. The idea at the basis of the whole scheme of its construction and administration is to endeavour to assimilate as far as is possible the conditions of life of the patients to those of sane people in an ordinary rural community. At a meeting of the Lunacy Board, held last week, the report of the deputation was fully discussed, and it was thereafter unanimously resolved to proceed with the construction of the new asylum buildings upon the villa system. The plans will be open to limited competition, and a rough estimate of the expense of the whole land, buildings, furnishings, water supply, &c., is made at about £150,000.

STONE, NORTH KENT.—The visiting committee of the City of London Lunatic Asylum recently submitted to the Corporation plans for proposed improvements to the asylum building at Stone, near Dartford, at a cost of £46,770, and these plans were adopted. The visiting justices afterwards invited tenders for the work from eighteen well-known firms of builders. Three declined, and the remaining fifteen sent in tenders ranging from £59,000 to upwards of £80,000. Those tenders were for the erection of the fabric of the building only, and did not include any machinery, internal fittings, or furnishing. The visiting justices consider that a further sum of £10,000 beyond the amount of the lowest tender will have to be expended on those items and on certain works which have become necessary. A very considerable increase had taken place in the price of builders' materials, more particularly in the price of bricks, and owing to the disturbed state of the engineering trade difficulty has been experienced on the part of the firms tendering in obtaining quotations for the ironwork required. The visiting justices are, therefore, seeking to obtain an increase of the grant from the Corporation to £70,000 instead of £46,770.

WOLVERHAMPTON.—Among the plans passed for new buildings by the Public Works Committee of the Corporation are some for Messrs. T. W. and J. Walker, hardware merchants, Temple-street, who propose to erect offices and warehouses in Fryer-street on a site lately acquired from the Corporation. Adjacent and in the neighbourhood of Canal-street, where old buildings are to be demolished, Messrs. John Shaw and Sons, also hardware merchants, Church-lane, are about to erect new and larger warehouse premises. Near to Messrs. Walker's intended new buildings, Messrs. Chubb and Son, lock and safe manufacturers, are about to erect a new manufactory to abut on Railway-street and Fryer-street, in lieu of their existing factory at the top of Horsley Fields. Other extensive business premises are likewise to be provided in the same locality on various sites sold by the Corporation under their improvement scheme. Development of building estates on the Heath Town side of the borough is going on at a rapid rate, especially in the neighbourhood of Park Village, Cannock-road, which is assuming the proportions of a newly-established town. Among the causes for this are the removal of Messrs. J. Evans and Sons' Culwell Engineering Works to Heath Town, and the erection of the electrical works of Messrs. Thomas Parker, Limited, and other establishments on the north-east side of the town. At the present time there is a brisker demand for houses than can be met, and such as has not existed for many years past.

Engineering Notes.

BUDE AND HOLSWORTHY RAILWAY.—This line, giving access to the picturesque coast of North Cornwall, is being carried out by the London and South-Western Railway. It will, for the present, be a single road, and will be 10½ miles in length. A short distance from the point where the new railway starts from Holsworthy (as a continuation of the existing line) a viaduct is being constructed, probably the highest in the West of England, except that at St. Austell. It consists of nine spans of a uniform width of 50ft., the greatest height from the bottom of the Deer stream being 93ft. The work on the railway is being carried on under the superintendence of Mr. W. Grainger, the representative of Messrs. John Aird and Co., of London, the contractors, and of Mr. E. Connal, resident engineer, representing Messrs. Galbraith and Church, C.E., of Westminster. The detailed work of this viaduct is in charge of Mr. McQueen, Mr. Grainger's engineer. Leaving Holsworthy, the line skirts the villages of Pyworthy and Derrill, and goes on to within half a mile of Bridgerule; then crosses the Tamar near the county boundary. At Merrifield works are in progress with a view to the construction of the only intermediate station throughout the course of the line. At Wolston there is another viaduct, comprising five spans of 50ft. each, and about 60ft. at its highest point. At Helebridge it has been necessary to divert the course of the stream and construct several bridges. Towards the Bude end the line passes along the valley of the Strat to the intended station near the junction of the Stratton and Bude roads, a short fork being taken further on to a point nearer the harbour, so as to serve the traffic to and from the sea.

INSTITUTION OF JUNIOR ENGINEERS.—This institution held the inaugural meeting of its 17th session on Friday night at the Westminster Palace Hotel. Sir Alexander Binnie, the retiring president, was in the chair, and presented the institution premium to Mr. W. R. Beckett for his paper on "The Protection of Buildings from Fire." Mr. H. B. Vorley moved, and Mr. W. J. Hunter seconded, a vote of thanks to Sir A. R. Binnie for the services rendered by him to the institution during his year of office, and this was heartily accorded. Mr. John A. F. Aspinall, M.I.C.E., chief mechanical engineer to the Lancashire and Yorkshire Railway, was then introduced as president for the ensuing session. Mr. Aspinall, who was warmly cheered, delivered his presidential address, the subject of which was "Some Aspects of Railway Work." He urged upon any young man who intended to learn the business of a railway engineer to make the best use of his powers of observation when he was in the workshop, so that he might store up a fund of useful information by the time he was fortunate enough to secure any position of responsibility. His experience had been that those young men who had in the first instance gone to one of the engineering schools and had afterwards gone into the workshop had generally begun at the wrong end. The tendency of the lad who went first of all to an engineering school and acquired some slight knowledge of what could be done upon a lathe or other simple tool was, when his time came to enter a mechanical engineering establishment, to assume he knew a great deal more than he actually did, and to give considerable offence to the workmen among whom he was placed, instead of setting himself patiently and quietly to acquire as much knowledge from them as he possibly could during the short time he would be in the shops. His view was that it was far better for a young man to enter the workshops for one or two years, and after that to go to one of the engineering schools, returning again to the workshops to finish his time. If that was done, he set himself to learn different theoretical subjects with very much greater interest, because he had somewhat definite ideas of the way in which theory could be applied to practice.

LEEDS AND BRADFORD LIGHT RAILWAY.—A scheme has been projected which has for its object the connection of the tramway systems of Leeds and Bradford by means of a line of light railway. The proposal is to construct a double line of electric tramway from the authorised Arndley terminus of the Leeds tramways to the termination at Thornbury of the Bradford tramway system. An application is to be made to the Light Railway Commissioners for authority to

carry the scheme into practical effect. The lease of the Bradford Tramway Company will shortly expire, and the Bradford Corporation have in contemplation the reconstruction of the whole system on a 4ft. 8½in. gauge (instead of 4ft. as at present), making the gauges of the Leeds and Bradford system the same, and the adoption of electric traction. The proposed route passes through the parishes of Bradford, Calverley, Calverley-with-Farsley, Farsley, Stanningley, Pudsey, Bramley, and Armley. The idea is to adopt the trolley system with overhead wires. Dr. Hopkinson, who was consulted by the Leeds Corporation during the construction of the Roundhay and Kirkstall electric tramway, is the engineer of the scheme.

SEA DEFENCES.—At a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on November 1st, Mr. G. Maxwell Lawford, president, in the chair, a paper was read by Mr. Richard F. Grantham, M.Inst.C.E., F.R.G.S., entitled "Sea Defences." The author referred to the rapid development of watering-places on the coast, and the large sums of money spent in their protection against the inroads of the sea; and to the loss of land in other parts by erosion. He observed that the sand and shingle freed by this erosion became the most important elements in the defence of the coast line. The removal of the drift for trading purposes therefore should not be allowed, and in many places has been prohibited. The forms of defence against the encroachment or overflow of the sea were divided by the author into three classes:—(1) Embankments of reclamation areas; (2) Upright stone, or concrete walls; and (3) groynes of timber, stone, or concrete. The walls of Canvey Island, which are 16 miles long, were described as typical of the first class. The wall fronting the Thames is four miles long, and its outer slope, the inclination of which is 3½ and 4½ to 1, is pitched with stone, which at the most exposed portion is 40ft. broad. The top of the wall is 18ft. above Ordnance datum, and the high water of spring tides rises from 11ft. to 12ft. above that datum. The author stated that upright walls ranging in profile were usually built at seaside watering-places. An upright wall caused a lowering of the shore in front owing to the scour induced by the impact of the sea against the wall, which thus gets undermined. Several examples were quoted. The function of a groyne is to deflect the waves, so that the drift may be deposited and retained in the vicinity of the groyne. The object of the deposition and retention is to gradually raise the level of the shore, which thus becomes a defence against the scouring action of the waves. Groynes erected on the Ligurian coast of Italy, and on the Yorkshire and Sussex coasts have stopped the encroachment of the sea without the aid of longitudinal walls. A system of low light groynes recently adopted at Dymchurch and New Romney has been beneficial in raising the level of the foreshore. The points to which especial attention was drawn were the importance of the littoral drift for defence, the necessity of groynes in certain situations, and groynes as the sole means of defence.

A life of James Abernethy, C.E., F.R.S.E., past president of the Institution of Civil Engineers, written by his son, Mr. John S. Abernethy, will shortly be published by Messrs. Abbott, Jones, and Co. It will contain numerous illustrations of the important harbour and other engineering works which the subject of the memoir designed and executed.

On Monday an interesting discovery was made in Mitton churchyard by two local antiquaries—viz., Mr. T. Harrison Myres, F.R.I.B.A., and Mr. Wm. Calderwood, of Ashton-upon-Ribble. These gentlemen were making a careful examination of the sundial, dated 1683. The circular cross contains a representation of the Crucifixion, enriched by mouldings and carved fleur de lis, six in number, on one side, and on the other three carved figures under canopies, which evidently at one time formed the eastern terminal of the church, and was not, as it was erroneously supposed, the upper part of a churchyard cross. The third stone in the yard under examination appeared at first sight to an untrained eye to be the socket or base of a roadside cross. Messrs. Myres and Calderwood dug round this stone, and it ultimately proved to be an octagonal font, in the form of a shaft, 2ft. 6in. long and 2ft. wide, the basal part being square. The bowl is 13in. in diameter and 8in. deep, and with the exception of a defect on one side, is complete. It is thought to be coeval with the Late Norman style of architecture, though without date or ornamentation of any kind.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

ART AND SANITATION.—Sir Wyke Bayliss delivered an address on "Art" at a *soirée* on Friday night in connection with the autumn exhibition in the Walker Art Gallery, Liverpool. Referring to the connection between art and sanitary science, he asked, What was art but the science of beauty, and what was sanitation but the science of health? Could they not make their great cities more habitable, more lovely? That was the question for consideration, and he would submit six propositions. First, that the progress of art in our country and the further development of some of its characteristics have been arrested, and are now seriously impeded by the foul condition of the atmosphere of our great cities; secondly, that the constructive arrangements and appliances necessary to avoid that evil are not irreconcilable with the laws of beauty; thirdly, that the law of beauty, as well as the law of health, is that things are right only in their right places; fourthly, that if we do nothing better with works of art than to smoke them like fitches of bacon, our artists would certainly not fulfil that law of supply and demand and give us works of art suitable for that purpose; fifthly, that any great scheme for the future of national and historic art is practically hopeless so long as this state of things continues; and, finally, he put it to them that to find a remedy for those evils they must not look to the artist, for the artist looked to them to see justice done. Having referred to the chief forms of art, he suggested that the nation through its representatives should choose the event, and the artists should choose the man who should paint one picture every year of the chief events of the year, or the most noble deed done, or the highest good achieved. That would, indeed, be true historic art—the marriage of art and history.

DEVON AND EXETER ARCHITECTURAL SOCIETY.—At the meeting of this society, held on Tuesday evening in last week at the Athenæum, Exeter, a paper on "Churches and Chapels: their Differences of Object and Construction" was read by the Rev. Oswald J. Reichel, M.A., F.S.A. The Rev. W. Hohl occupied the chair. The address was archaeological and ecclesiastical in character, and explained, by the light of Early Roman and Byzantine usage, the distinctions between parochial and non-parochial places of worship, emphasis being laid on the fact that the term "church" originally denoted an assembly of citizens, and had only secondarily derived its present application to the building in which the congregation worshipped. Mr. Reichel urged that there was and always had been, in the use of the term church applied to buildings, a broad distinction between public churches and private churches. Public churches or ancient minsters were those provided with a staff of clergy capable of handing down tradition and exercising public discipline. Private churches were praying places for the living, or places for commemorating the dead. Intermediate between public churches and private churches were the village churches, the majority of which were originally private chapels served by itinerant clergy, but were constituted in a certain sense public churches, and endowed with tithes and lands as such by the Norman conquerors between the 11th and 13th centuries in this country. The intermediate character of a village church was therefore represented in its architecture. Instead of a presbytery, apse, and detached altar, the altar was fixed against the north wall, and seats for one, or at most three, clergy were placed on the south side. This construction of a village church has reacted on the construction of the cathedrals.

EDINBURGH ARCHITECTURAL SOCIETY.—The thirteenth meeting of the session was held on Wednesday in last week, Mr. J. A. Williamson, A.R.I.B.A., President, in the chair. Mr. A. N. Paterson, M.A., A.R.I.B.A., Glasgow, delivered a lecture, entitled "Evolution of the House," illustrated by diagrams. Mr. Paterson first treated of the earliest developments of domestic dwellings, and then described, in historical order, the houses of the Greeks and Romans, the Saxon hall, and Norman castle, the grange and the monastery, the early town house, and the mansions of Elizabethan and Jacobean times. He traced the special Scottish developments from the 15th to the 17th centuries, and gave a short description of the Palladian type of house, and the house of the times of Queen Anne and the Georges.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—The monthly meeting of this society was held at the School of Art on Monday, when there was an unusually large attendance. The president (Mr. R. W. Fowler, F.S.I.) was in the chair. The following new members were elected:—As Associates: Arthur Appleby (student), Frank Barker (student), Henry W. Beale, John H. Chorlton, Sydney L. Chipling (student), Joseph W. E. Clayton (student), Herbert Ogden, George E. Turner (student). As Students: Wm. C. Antcliffe, Charles F. Bond, Herbert S. Hague, Thomas Jowitt. Mr. J. A. Gotch, F.R.I.B.A., F.S.A., of Kettering, delivered an interesting lecture on "Eighteenth-Century Architecture," which was amply illustrated by numerous photographs of buildings. The lecturer said the view of architecture taken in the 18th century was very narrow, being little more than a consideration of the Five Orders. Architectural design was amateurish and artificial, and its professors were far behind the great masters, Inigo Jones and Wren, in ability. The large houses, of which many were built for great nobles, were devised for display rather than comfort. The smaller houses, however, were much more pleasing, and there are few towns which do not possess specimens of the Queen Anne or Georgian house, simple and appropriate in design, and marked with enough character to render it interesting. The interiors of these smaller houses are generally well treated, and the woodwork of the period still furnishes abundant hints to designers of the present day. One inheritance we have from that time which alone would render it memorable, namely, the sash window.

THE ARCHITECTURAL ASSOCIATION OF IRELAND.—The Architectural Association of Ireland held their usual fortnightly meeting in the Grosvenor Hotel, the President in the chair. Mr. T. R. Scott delivered an address on "Furniture," chiefly from a practical point of view. The lecturer illustrated his remarks by a large number of specimens of work, finished articles of the Sheraton and Chippendale periods, and examples of Early Victorian, these last chiefly as specimens of what to avoid in design and construction. Mr. Scott also sketched numerous diagrams on the blackboard. He dwelt on the importance of allowing sufficient time to execute an order in, reminding his hearers that there was no such thing as timber over 3in. thick seasoned fit for immediate conversion into articles of furniture. Hence, he said, architects should design so as to admit of small scantlings being used, and, if necessary, built up to avoid the use of great masses of solid wood. The lecturer strongly advocated the great utility of dowelling as opposed to tenoning for indoor joinery. At the conclusion of the lecture, Mr. Scott answered numerous inquiries. Mr. Moore proposed a vote of thanks, saying he had often been troubled to get a tenon in certain forms of construction which would really hold the work together without cutting away all the stuff, and said dowelling appeared to afford a valuable method of dealing with certain problems. Mr. R. M. Butler, in seconding the vote of thanks, thanked the lecturer for the eminently practical address delivered. He said it was oftentimes a source of difficulty for an architect to know the very best method of construction in every handicraft, and one felt small if some shop foreman pointed out utter impracticabilities in a working drawing. Lectures like Mr. Scott's would do much to tell the members many things that could not be learnt from books. Mr. George Sheridan and Mr. Holloway also spoke. The president, in putting the motion, said many theorists said an architect should first be a craftsman and then a designer. He supposed one should first spend a year or two in a carpenter's shop, then in a forge, another year at a cabinet-maker's, another at a stained-glass works, and yet another at a foundry, and if the architect then had any spare time, he might devote it to picking up something of architecture; but he thought the nearest thing to such a course in these times were lectures like these. It was announced that Mr. A. W. Moore had been appointed joint secretary in the room of Mr. Gleave, resigned; and that Mr. Geo. Sheridan, A.R.I.B.A., had been co-opted a member of committee to fill the vacancy created by Mr. Moore's appointment; and Mr. Joseph Geoghegan had been appointed honorary librarian in the room of Mr. Frederick Hicks, resigned. Mr. Butler announced that he hoped to make arrangements for further practical

lectures on handicrafts, the next of which would be on the 16th inst., when Mr. McGloughlin would lecture on "Wrought Ironwork." Visits would also be paid to the workshops and forges. Four new members were declared elected.

CHIPS.

In the case of the application for discharge from bankruptcy of Henry Foster, of Plymouth, builder, the discharge has been suspended for six months, ending March 22, 1898.

A new Lyric Theatre is about to be built at Eccles from plans by Messrs. Campbell and Horsley, of Manchester. It will be Renaissance in style, and faced with red terracotta and Rainhill stone dressings. It will contain over 1,270 seats.

Mr. H. Shaw, an inspector of the Local Government Board, held a public inquiry at the Hall Hotel, Hope, with reference to the application of the rural district council of Chapel-en-le-Frith, to borrow £1,800 for the purpose of providing a water supply for the township of Hope. The plans were explained by Mr. Wm. Sterling, of the firm of Sterling and Swann, engineers. There was no opposition.

A lych-gate, constructed by Messrs. Harry Hems and Sons, of Exeter, has just been placed at the entrance to the churchyard at Hooton Pagnell, near Doncaster. It is of oak, resting on dwarf walls of local masonry, and is covered in by red tiles. It was designed by Mr. E. Bernard Wilson, architect to the Frickley estate, and is Perpendicular in style.

New sewerage works constructed for the urban district council of Thurlstone, near Penistone, at a cost of £5,600, were opened last week. Mr. T. Aird Monroy, of Sheffield, was the engineer, and Mr. Frank Eyre, of the same city, the contractor.

Whilst some quarrying operations were being carried out recently at Messrs. Parker's quarry on the Totnes-road, near Newton, the opening to a large cavern was exposed. It consists of three chambers, the largest about 100ft. in length, and it is incrustated with innumerable stalactites and stalagmites of various shapes and sizes, and of different periods of growth. As yet no attempt has been made to discover the actual size of the cavern, and several passages remain to be explored. Appearances indicate that the cave has never previously been entered either by man or beast.

The chancel of the parish church of Bottesford, near Grantham, which already contains many handsome memorials of the family of the Duke of Rutland, has been further enriched by the insertion of another stained glass window to the memory of the late rector, Canon Norman. The window contains three lights, which respectively portray the texts, "I am the Light of the World," "I am the Bread of Life," and "I am the Good Shepherd." The window, which is very effective, is from the studio of Messrs. Jones and Willis, of Birmingham, London, and Liverpool.

The new sanatorium, Brighton, is being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke flues, and Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The burgh commissioners of Langholm, N.B., held a special meeting, on Monday, to consider the Langholm Bridge dispute. A letter was read from Mr. Knox, the contractor, offering to submit the question to Mr. Barbour, architect, Dumfries, and Mr. Burnet, architect to the Duke of Buccleuch, or any other competent person who was not one of the burgh commissioners. He, however, reserved the right to appoint one arbitrator on his own behalf. It was unanimously resolved to allow the matter to be settled in the law courts.

The parish church of St. Mary, Playford, near Ipswich, was reopened on Wednesday week, after the re-roofing of the nave, as a memorial of the Queen's Diamond Jubilee. Formerly the nave was celled, and the rafters above had become rotten, so that it was absolutely necessary that the roof should be restored. A plain open roof of oak has now been substituted, the work being executed by Mr. A. Kersey, Great Bealings. New gable crosses have been placed at the east and west ends of the nave, the work being executed by Mr. Stephenson, Woodbridge. This has completed the restoration of the church, for the chancel and organ chamber were entirely rebuilt in 1873 by the Marquis of Bristol, and in the following year the body of the church was filled with oak benches, and a new pulpit was erected.

At the annual meeting of the Newport (Mon.) Town Council, on Tuesday, the Corporation seal was affixed to an agreement with Mr. Baldwin Latham on his appointment as engineer to the Wentwood Water Works. It is reported that the expenditure on the works up to the present is over 100,000.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 60s. 0d. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLII., XLIII., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

SAXON. (We have had quite enough of the correspondence, and we are not going to add fuel to fire by inserting your letter. It is libellous. People who use the word "untruthful" must put names and addresses to their letters if they expect them to appear.)

RECEIVED.—P. P.—G. B. W.—S. T. W. and Co.—B. N. D.—V. L. M.—A. O. A.—R. S.

"BUILDING NEWS" DESIGNING CLUB.

SECOND LIST OF SUBJECTS.

B.—A small coachhouse and stable forming an entrance-way to the grounds of a country house, the coachman's dwelling being included and used as the lodge for this approach. The building is to stand on the frontage line of the property facing a high road. The accommodation is to provide for four stalls and two loose boxes; a coachhouse for four traps or carriages, a harness-room and washing covered space, and a loft for hay and corn. The entrance way to be large enough to drive through. The dwelling to comprise a small parlour, good kitchen, 16ft. by 14ft., and larder, small scullery, and wood shed; three bedrooms, one of which to be reached from loft, for use of groom. A man's w.c. besides that for use of lodge. No limit is placed on the site frontage, which is straight and level, facing N.W. The price will govern the undertaking, and £1,500 is the contemplated outlay. Style to be suited to a stone district, and roof covered with tiles. Picturesque simplicity and grouping is to be aimed at, and fussy, meaningless detail avoided. Scale, 8ft. to the inch. The plans may be 16ft. to the inch if desired. A perspective view of the front is essential, and sufficient elevations and sections to illustrate the design properly.

DRAWINGS RECEIVED.—"Spero," "Check Mate," "Bonum Consilium," "Cobden," "Petticoats," "Bull's Eye," "Wen," "Go," "Dachi," "Orb."

Correspondence.

ENGLISH AND IRISH ARCHITECTS.

To the Editor of the BUILDING NEWS.

SIR,—I am loth to trouble you with another letter, but the statements of "A Ghost who has Walked," in your last issue, are calculated to mislead your readers.

He says the revival of the Architectural Association of Ireland is entirely due to Englishmen.

It is only fair to say that this project was first suggested some few years ago by an Irishman now fulfilling a professional engagement in London. Chiefly owing to his departure it remained in abeyance until some twelve months since, when it was revived through the letters of two gentlemen, Messrs. Gavagan and Macnerney, addressed to a daily journal. To them is due the fact that the movement took shape when it did. Beyond the fact of desiring to give credit where it is due the members of the Association are, as far as I am aware, not guilty of the ill-bred impertinence of inquiring into the religious belief and nationality of their fellow-members and of the friends and well-wishers of the Association as "Ghost" would have your readers believe.—I am, &c., R. M. BUTLER.

Dublin, Nov. 8.

Memorial stones of a Wesleyan chapel were laid in Sidney-street, Burton-on-Trent, on Wednesday week. The building will be Gothic in style, will seat 400 people, and will cost £1,300. Mr. C. F. Underhill, of New-street, Burton, is the architect, and Mr. J. Harlow the contractor.

The new hospital at Kettering, built from plans by Messrs. Gotch and Saunders, of that town, was opened on Saturday. It contains 22 beds, and is built of local brownstone, with Weldon stone dressings, the roof being tiled. The two large wards are each 40ft. by 24ft. Mr. A. Barlow, of Kettering, was the builder, and Mr. G. Vinell, of Oxford, the clerk of works. The outlay has been under £6,000.

Foundation stones of Wesleyan schools at Holly Hill, Felling, were laid on Friday. The building is of local stone. A central hall or school room, 57ft. by 30ft., forms the main department, having at the sides halls, book stores, cloak rooms, and four classrooms each 12ft. square, and two larger classrooms, the latter being divided from the school room by movable partitions. Mr. James W. Frazer, of Newcastle-on-Tyne, is the architect, and Mr. Robert Davidson, of Felling, the contractor. The cost will be £1,500.

On Sunday a new pulpit was dedicated at St. Budock's church, Cornwall. The pulpit is of carved oak, standing on a massive pedestal of Breage granite and steps of the same. Mr. Carah, of Praze, executed the work.

Gas and water companies have the privilege of using the subways along the streets of the Metropolis on more favourable terms than other companies. Desiring to participate in these benefits, the London Hydraulic Power Company claimed that the London County Council's charges against them should be reduced to the level of that of a water company. The point having been argued before a Divisional Court of the Queen's Bench on Saturday, Justices Wright and Kennedy held that the Hydraulic Company was not a water company, their duty being not to supply water to the public, but to return it to the river when they had done with it. Judgment was, therefore, given for the County Council.

The Bishop of London visited West Green, Hornsey, on Saturday afternoon, and dedicated the wrought iron chancel screen, stained east window, and lectern, which have just been placed in Christ Church. The window is of five lights, and represents as many incidents in the Life of our Lord. All three additions have been executed by Messrs. Jones and Willis, of Great Russell-street, W., and Birmingham.

The asylums committee of the London County Council will shortly ask the Council to sanction a large expenditure for the provision of temporary buildings for the accommodation of female lunatic patients on the Horton Manor Estate, Epsom. It is on this estate that the Council is about to erect a permanent asylum, but, as this cannot be finished before the end of the year 1900, it has become necessary to immediately provide further accommodation. The Bexley-heath Asylum, which is now being constructed, will not be finished until the beginning of 1899. The primary cost of the proposed buildings, which are designed to be occupied for 15 years and to accommodate 700 female patients, is £147,000. It is proposed to complete the temporary buildings within the next twelve months.

Colonel Hepper, C.E., an inspector of the Local Government Board, held an inquiry on October 28th at Holloway, Derbyshire, touching an application to borrow £850 to remedy a failure of a water scheme put down at a cost of £2,300 a few years ago. The application was made by the Rural District Council of Belper, and it appeared that the whole of the higher portion of the district of Dethick, Lea, and Holloway is without water, and has been so for three months. The scheme laid down was reported upon by Mr. Frith, C.E., and he recommended taking out the two engines used to pump the water to the higher level, and the substitution of others calculated to do the work.

PUBLIC LIBRARY AT HAMPSTEAD.—ALDFORD RECTORY, CHESTER.—PEACOCK, WILLSON, AND CO.'S BANK AT LINCOLN.—SELECTED DESIGN FOR HALIFAX POLICE-STATION AND COURT-HOUSE.—TOMB OF FILIPIO DECIO AT PISA.—MRS. WALDO'S HOUSE, MADISON AVENUE, NEW YORK.

Our Illustrations.

HAMPSTEAD CENTRAL PUBLIC LIBRARY.

Our illustration represents the building, which was opened on Wednesday, the 10th inst., by Sir Henry Harben, who is the donor of £5,000 for its erection. By the plan published, it will be seen that the whole of the original scheme has not yet been completed, the intention being at some future time to use the present lending library as a book store, and to erect a new one, together with a lecture hall, &c. (on the level of the upper ground floor) upon the remainder of the site to the west of the Arkwright-road entrance. The building is faced with Cranleigh red bricks, with Portland stone dressings, and has been carried out in a phase of the Later Tudor style, with large mullioned windows with iron casements, in order to obtain thoroughly good lighting to all parts. The reference library has an open-timbered roof. The news and magazine room roofs, which are partly open, in order to get the largest possible amount of air-space, are finished with plaster between the wooden beams so as to form panels. The two latter rooms adjoin with an arcade of Hopton wood stone between them. The building has been successfully carried out by Messrs. F. Gough and Co., of Hendon, whose tender, amounting to £4,954, was accepted by the vestry. The same firm has carried out the rest of the work, which consists of forming the boundary walls of the same materials as the building, and curved sweeps of York stone steps up to the porch facing Arkwright-road. The central hall and corridor are paved with mosaic, executed by Messrs. B. Ward and Co., of 15, Great George-street, Westminster. The building is heated throughout on the low-pressure system. The upper ground-floor is fitted with a circulation of 2in. wrought-iron pipes and radiators. The electric lighting has been carried out under the supervision of the vestry's electrical engineer. The furniture has been executed in teak, according to the designs supplied by the architect, Mr. Arnold S. Tayler, of 2, The Sanctuary, Westminster.

ALDFORD RECTORY, CHESTER.

This view, which we give with a copy of the ground plan, illustrates this characteristic country rectory from the garden. The copings and dressings generally are of stone, the walls being of brick. A distinguishing feature of the plan is the commodious hall, and a parish room with a distinct entrance is usefully contrived. The architects are Messrs. T. M. Lockwood and Sons, of Chester.

MESSRS. PEACOCK, WILLSON, AND CO.'S LINCOLN BANK.

THESE premises, which have just been opened for business purposes, have a frontage of 40ft. to the High-street, Lincoln. The basement, lined throughout with glazed brick, contains the strong-room, clerks' cloakroom, store-room, and heating chamber, the latter being approached by steps in the yard at the rear of the building. The ground-floor is occupied by the banking office, manager's-room, waiting-room, and the lavatory, &c., in connection therewith; a lift is provided to convey the ledgers and cash from the banking office to the strong room in the basement, which is also approached by a small staircase descending beneath the platform of the manager's desk. The remainder of the ground-floor is occupied by the entrance and staircase to the manager's house, which entirely occupies the first, second, and third floors, and is also approached by an open stone staircase in the yard at the rear, where a lift is provided to convey tradesmen's goods, coals, &c., to the kitchen. The building is wired throughout for the electric light, and warmed by hot water on the low-pressure system. The bank office is finished with oak dado, screens, and doors, mahogany desks and counter, and fibrous plaster enriched walls and ceiling, with oakwood block flooring on the clerks' side of the counter, and marble mosaic on the customers' side. The whole of the moulded and enriched work in the front elevation has been executed in Doulton's brown buff terracotta, the manufacturers of the other special works being Messrs. Dorman, Long, and Co. for steelwork. The general contractors were Messrs. Wadsley and Co., of Billingham, the amount of their contract being £3,900, exclusive of bank fittings. The architects were Messrs. Watkins and Son, of Lincoln.

COURT HOUSE, HALIFAX: SELECTED DESIGN.

WE give the plans and elevations of the new Court-house and Police-station, which the corporation are about to erect on the site of the old infirmary, from the designs prepared by Messrs. George Buckley and Son, architects, of Tower Chambers, Halifax. The police entrance is from Carlton-street, and leads into a large entrance hall. The police-offices front to Harrison-road, and are reached by a wide corridor. The charge-room and inquiry office is in close proximity to the entrance hall, and the cells are placed round the parade ground. To these a special corridor leads, commencing with a lobby for the prisoners waiting to be charged. Near at hand is the search-room. To the right of the entrance-hall is a large parade-room, and fine wide staircase leading to the first floor with a large recreation-room, policemen's lavatories, bathrooms, &c., also to the basement and minor offices of this department. The warrant entrance is in Harrison-road, and leads to the inquiry and warrant-

office, and the rooms of the magistrates' clerk, chief constable and his clerk on the first floor. The magistrates will enter from Blackwall. On the ground-floor are the magistrates' cloakroom, a small retiring-room; and the lunacy-room. The entrance-hall here is a well-proportioned one, and gives access to a wide staircase leading to the magistrates' retiring-rooms and Court-house. One of the rooms for the magistrates—a large one—may be used as a subsidiary court. The solicitors' entrance stands in Blackwall, too, and their rooms, and those for clients and witnesses front to Ferguson-street. The general public will have an entrance from Ferguson-street, and a large entrance-hall is provided which will meet every tax upon its capacity when, for instance, the Court is cleared. On the ground-floor accommodation is also provided for a gaoler's house and matron's apartments. The Court-house is well-lighted, and has open areas on two sides. Conveniences and cloak-rooms will be provided in every department, and there is a large open parade-ground with a covered portion. A four-stall stable will stand at the back, together with a coachhouse and harness-room, with a hay-loft above. The style of the exterior is Renaissance. We published the first premiated design from the late competition held for this building in our pages for October 29 last.

TOMB OF FILIPIO DECIO AT PISA.

THIS famous sarcophagus at Pisa, by Stagio Stagi, is in the Campo Santo, and this beautiful tomb of the Cardinal is the chef-d'œuvre of the artist. Among other specimens of his magnificent carving are the candelabra on either side of the high altar in the Duomo of Pietra Santa, a small place north of Viareggio, about 40 miles from Pisa, and in the Duomo at Pisa is an altar-piece from his hand in white marble. Stagio Stagi, like many other Italian artists, seldom did any work far away from his native place and its neighbourhood. A cast of this monument, which we illustrate to-day, is to be found in South Kensington Museum. The work dates about 1530. Our illustration is from a very delicate pencil measured drawing made at Pisa from the original, by Mr. H. V. Lanchester, and the details given of the ornament are most useful and suggestive.

MRS. WALDO'S HOUSE, MADISON AVENUE, NEW YORK.

THIS handsome building, situated on a corner site in the aristocratic thoroughfare of Madison-avenue, is a somewhat plain adaptation of the French Renaissance style. It is built of stone, and is well-lighted throughout, and in quiet dignity is a welcome relief from the ornate affectations of so much of the American work. Messrs. Kimball and Thomson are the architects. Our illustration is from the pages of the *American Architect*.

Col. Rowlandson, the new Mayor of Durham, is the land agent to the Dean and Chapter of Durham.

Nov. 12, 1897.

QUESTIONS.

[11835].—**Parchment Plans.**—I shall be glad to know what is the best substance for mixing with ink and colour to prevent "running" in the preparation of plans on parchment paper.—T. A. W.

[11836].—**Repairing Drain.**—Where the yard grid of a person's property drains an area common to several properties, and consequently different owners, does not this form a public drain or sewer repairable by the local authority, on the principle that a sewer serving more than one house is termed "public," and, although the owner has been called upon by the local authority to repair and make good same, have at last done it themselves, free of cost?—YORKSHIRE BITE.

[11837].—**Pavement Slabs.**—Having a quantity of granite chips I wish to make into slabs for paving and other purposes, will some kind reader say whether I shall require a crusher and other machines or cement? If so, what quantities, and how to mix? Any other hints for making concrete landings and steps.—ABERDEEN.

[11838].—**Measuring-off Works.**—Is it not unusual for an architect of a building to allow the contractor to bring an outside surveyor to check him in measuring-off additions and deductions, either at the completion of the works, or where the contractor has been stopped for negligence and not complying with the terms of the contract?—DOUBTFUL TOMMY.

[11839].—**Blisters.**—I have a pitch-pine door facing south, made and hung in 1892, which has been painted three times. The outside is painted and varnished, but it blisters where the knots are, also where there are no knots. I shall be glad if any of your readers can say what is the cause, and suggest a remedy.—PUZZLED.

[11840].—**Measurement of Stonework.**—Which is the best way of measuring stone; should it include labour? Many directions are given, but I should like to know the practice recommended by the best surveyors.—STUDENT.

[11841].—**Queen Anne Churches.**—Will any reader give me the names of a few good examples of churches built or restored during the period in the neighbourhood of London?—X.

[11842].—**Artificial Stones.**—Which is the most durable stone of this class for paving, and cost per yard? A reply will oblige.—A SURVEYOR.

REPLIES.

[11831].—**Bright Red Cement.**—Use Venetian red, or any other red oxide of iron, to colour the usual cement the required bright colour.—H. C. S.

[11831].—**Bright-Red Cement.**—Oxide of iron is usually employed for staining Portland cement, the proportion required being regulated by the tone of colouring required, which is best determined by mixing several samples in varying proportions. The result, as far as colouring goes, is not generally everything that could be desired. Venetian red gives a better shade of colour, but deteriorates the strength of the cement. Brickdust requires to be ground very fine to act as a good staining matter.—THOMAS POTTER.

[11833].—**Painting Galvanised Roofing.**—Metallic zinc, or iron galvanised with zinc, may be painted on with ordinary paint if the metal be first prepared in one of the following processes:—No. 1.—Dissolve 64 parts (by weight) of water 1 part (by weight) of chloride of copper, 1 part (by weight) of nitrate of copper, 1 part (by weight) of sal ammoniac, and when these salts have dissolved, add 1 part (by weight) of hydrochloric acid, and brush this over the zinc with a mop or old (but clean) brush, and in 12 to 24 hours proceed to lay on the paint in the usual way. No. 2.—Take some hydrochloric acid, and "kill" (i.e., neutralise) this acid by dropping in pieces of zinc until effervescence ceases, then add an equal bulk of water, and lay this compound (fluid chloride of zinc is highly poisonous to cuts in the flesh) on the zinc surface, and after a short time wash off the compound water or diluted vinegar, and then dry the surface of the zinc and proceed to paint it. If the galvanising is a tin, instead of zinc, coating, the following paint may be used:—Mix together by grinding 30 parts (fluid measure) of linseed oil, 10 parts of oil of turpentine, 14 parts of red oxide of iron, and 46 parts of red ochre (or ammonium boli); reduce, if required, with a mixture made of equal parts of linseed oil and turpentine. Give two coats, allowing the first to dry before applying the next, but do not lay them on too thick, and be sure the metal is free from rust or grease (a wash all over with diluted hydrochloric acid will sufficiently cut the grease to enable the paint to adhere.—H. C. S.

[11833].—**Painting Galvanised Roofing.**—Galvanised iron is better left a short time, then washed or scrubbed, and painted with one or two coats of Torbay oxide paint, as circumstances permit. The durability of galvanised iron depends largely on the purity of the surrounding atmosphere. In country places it will last 30 to 40 years, in towns it depends upon surrounding conditions. If the air is charged with sulphur fumes the zinc coating is soon destroyed. Owing to competition in prices, galvanised iron is not so good, as a rule, as it used to be.—THOMAS POTTER.

[11833].—**Painting Galvanised Roofing.**—I should advise "Much Advised" to follow the recommendation of his second friend, to wait some time before painting his galvanised iron roofing—until, in fact, the "salts of the galvanising" are out. To paint it at once would be probably to court failure. My experience of painting galvanised iron roofing has been that after a few months the coating peels off. The boiled linseed-oil coating is no doubt a good preparation, but the oxide of iron paint will be sufficient after the "salts" disappear.—AN ARCHITECT.

[11834].—**Section of Girder.**—The way to calculate the required sectional area of a rolled iron girder when

the load is in a certain position is shown in most manuals. The expression is $M = Wx - Wx^2 = \text{maximum moment}$ of stress, W indicating the load, and x the distance from support. Manufacturers of rolled joists publish tables showing strength of sections they supply, and will give "L. H." all he requires. For structural work, an ultimate strength in tension of 28 to 32 tons per square inch is given. Take for working stress, one-fourth—OTTO.

CHIPS.

At Fazeley, near Tamworth, the foundation-stone was laid on Saturday of a public hall to be given to the village, at a cost of £2,000, by a Burton brewer.

The career and works of Mr. Walter Emden, J.P., L.C.C., the newly-elected President of the Society of Architects, form the subject of a special article in the last issue of the *Era*.

Mr. Astor's huge table, made of a single sectional piece cut out of a Californian redwood tree, has arrived at Clivedon. It was brought by road from London, and reached its destination on Saturday night. The slab weighs $13\frac{1}{2}$ tons, and stands 16ft. high. The journey from London occupied two days, although the trolley was drawn by several horses. There were several mishaps on the road.

The Bishop of Clifton performed the reopening ceremony at the Convent of Mercy Chapel, at Westbury-on-Trym on Tuesday. The church has been decorated in the Italian style by Mr. Hopkins, of Birmingham.

The Bristol Town Council have decided to postpone for the present the scheme for extensive dock extensions at Avonmouth, in order to allow time for further negotiations with the railway companies, whose co-operation is necessary.

The memorial stone of a parish room at Stevenston, Bedford, was laid on Thursday in last week. The building will cost £650, and will be of local red bricks with stone dressings. The architects are Messrs Usher and Anthony.

The Bishop of Reading has dedicated a churchyard cross at Glympton, near Woodstock, which has been erected to the memory of the late Mr. Henry Barnett, of Glympton Park. The cross, of Portland stone, consists of a tall column resting on a base of two broad steps. At the top of the column, under a slightly recessed canopy, there is a carving in relief of the Crucifixion, with the attendant figures. The cross was designed by Mr. W. J. Tapper, of Gray's Inn.

At Emmanuel Church, Camberwell, on Sunday, the Bishop of Rochester dedicated an east window. The window is one of three lights, representing "The Adoration of Christ in Paradise by Saints and Angels." It has been designed and executed by Messrs. Powell, of Whitefriars.

The work of restoration in Oldham Church is now accomplished, so far as the first part of the scheme is concerned, which includes the restoration of organ and tower, rehanging of twelve bells, and adding chiming apparatus to eight bells, the re-seating of part of the nave, the fitting-up of a choir vestry, and the relighting of the nave. This church was built by special Act of Parliament in 1829. The first stage of restoration embraces half the pews in the centre of the nave, and among the alterations is the removal of an iron grille which was formerly drawn across the aisles to separate the few narrow free seats from the cushioned and carpeted square pews.

A church mission-room has been erected at Fitzhugh, Southampton West. The building is 53ft. by 20ft. The height of the walls, of fair red brickwork, is about 14ft. to the wall plate; and the roof is open-timbered. There is sitting accommodation for 150 persons. The mission-room was designed by the honorary architect, Mr. A. F. Gutteridge, of the firm of Messrs. Mitchell, Son, and Gutteridge, and the erection was carried out by Mr. A. Warden.

Mr. Henry Adams, of Grayingham House, Worthing, and of 250, Camden-road, upholsterer, for many years with Maple and Company, and a director since its formation of the Maple Company (Limited), who died on September 19, aged 72, left personal estate of the value of £92,153.

Sales were not very numerous at the Auction Mart last week, but the results were, on the whole, highly satisfactory. The aggregate realisation as registered at the Estate Exchange was £119,586, which showed a large advance on the amount recorded for the similar period of 1896, when the total was only £49,335.

Arrangements have been made for commencing the extensive alterations and improvements in connection with the Pontefract Workhouse. These consist of developments of the accommodation for vagrants, and extensions of the laundry arrangements. The total amount involved is £7,695. Mr. W. H. Greaves, of Pontefract, is the architect.

The Queen has bestowed the Silver Jubilee Medal upon Professor George Aitchison, A.R.A., President of the Royal Institute of British Architects.

The Midland Railway Company's engineers are at the present time surveying in Sheffield with a view to the widening of the main line between Dore on the south and Masborough on the north, a distance of nine miles. The engineers have also been instructed to report upon the advisability and probable cost of building a new station in a more central part of the city.

At the church of St. Mark, Fitzhugh, near Southampton, built in 1891, an organ has just been erected, and was dedicated last week. It has cost, including the oak case, £800, and was constructed by Messrs. Ginn's Brothers, of Merton.

The annual dedication festival of Almondbury Church was marked by the dedication of a marble pavement, and a new screen at the west end. The pavement has cost £250, and the oak screen, fitted with cathedral glass, was carried out by Messrs. Holland, of Huddersfield. The north internal wall has been stripped of plaster, so as to reveal the original stonework, and it is contemplated carrying out this work with regard to the remainder of the walls. The font is to be placed at the west end of the south aisle. It is intended that the verger's house in front of the tower shall be pulled down, so as to open out the west end entrance.

Mr. William J. Akin, assistant to State Architect I. G. Perry, and resident architect and building superintendent of the St. Lawrence State Hospital, died on Oct. 24 at Ogdensburg, N. Y.

The Staffordshire County Council have appointed Mr. K. Walter Gregory as assistant surveyor for the Leek district, in succession to Mr. Kinnison, resigned; the commencing salary is £175 per annum.

At the Central Criminal Court on Friday, the Common Sergeant sentenced a man named Frederick Fenn, who called himself an architect, to five years' penal servitude, for being concerned in a conspiracy to defraud the public by bucket-shop stockbroking swindles under the names of Hartridge and Co. and Frank Tarrant and Co.

The Secretary of State for India has appointed Colonel Sir William Sinclair Smith Bisset, K.C.I.E., R.E., late Secretary in the Public Works Department of the Government of India, to be Government Director of Indian railways, in succession to General Sir Edward Williams, K.C.I.E., R.E., whose tenure of the office has expired.

At Mostyn House School, Parkgate, the Bishop of Chester dedicated last week a new chapel. It is built of Ruabon brick and terracotta facings, is of Gothic character, and is said by local journals to have been designed by the master, Mr. A. G. Grenfell, the work being carried out by Mr. W. Fleming, of Neston. The interior fittings of the church were designed by Messrs. Frazer and Warburton, architects, Warrington. The seating is of polished pitch-pine, while the panelling and framing is of the curly pitch-pine. The seat ends have been carved by Mr. T. A. Allen, of Chester. The flooring is of oak wood blocks, laid to a special design, while the roof is of pitch-pine. The terracotta was supplied by Mr. J. C. Edwards, of Ruabon.

The River Tyne Commissioners considered in committee, on Friday, in Newcastle, a communication from Sir J. W. Barry and Messrs. Coode, Son, and Matthews, engineers, London, principally having relation to the damaged North Pier. Several of the members were in favour of the work being carried out by their own workmen, under the supervision of their engineer, whilst others proposed that the responsibility of seeing to the repairing of the damage to the pier be entrusted to the London engineers, and that the work be carried out by contract. After a long conversation, it was decided to adopt the second proposal. The following candidates have been selected from the applicants for the position of chief engineer to the commissioners:—Mr. Jas. Walker, Douglas, Isle of Man; Mr. Alexander Hamilton, Clyde Trustees, Glasgow; and Mr. M. F. S. Wilson, Harbour Works, Dover.

A memorial service was held on Tuesday in the church of St. Cybi, Holyhead, on the occasion of the opening of a south aisle to the chancel, and the unveiling of an altar-tomb, in memory of the late Hon. William Owen Stanley, of Penrhos. The altar-tomb, which is by Mr. Hamo Thornycroft, R.A., is Italian Renaissance in style, and it is executed in white Carrara marble. It consists of a life-sized recumbent figure of Mr. Stanley, with watching angels at the head and feet; the one seated at the head, representing Immortality, holds a wreath; the other, representing Death, holds an inverted torch. The wings of the angels are outstretched, and almost meet above the effigy. The front and ends of the base, immediately below this group, are enriched by panels in low relief, the centre panel containing the inscription tablet, supported by kneeling figures. The architect of the new aisle is Mr. Harold Hughes, F.R.I.B.A., of Bangor, and the builder Mr. Bridgeman, of Lichfield.

LEGAL INTELLIGENCE.

DILAPIDATIONS AT A BRICKFIELD.—**BOYES v. FOXLEY.**—In the Queen's Bench Division on Friday the hearing of the case of *Boyes v. Foxley* came before Mr. Justice Bingham, sitting without a jury. It was an action by Mr. William Boyes to recover from the defendant, John White Foxley, of Rugby, possession of certain brickfields, known as the Old Coppice, Dean's Manger, Northamptonshire, and £100 for dilapidations. The defendant denied that he was in possession, and paid into court £32 in discharge of the dilapidations. It appeared that the brickyard in question had been leased in 1866 by the plaintiff's predecessor in title to the defendant's predecessor, but the lease had expired, and the defendant's predecessor in title continued to occupy from year to year. The defendant came into possession on the death of Thomas Foxley in 1895, and in 1896 he gave notice to quit at Lady-day, 1897. Thereupon the plaintiff had the dilapidations valued, and supplied defendant with a copy of the valuation; but according to the plaintiff's case the defendant had neither given up possession nor paid the dilapidations. Several witnesses having been examined on both sides as to the dilapidations, his lordship gave judgment for the plaintiff, fixing the amount to be paid by the defendant at £90, with costs. His Lordship said it was a great pity that the defendant had not made arrangements to settle the matter without incurring the costs of litigation.

DISCOUNT ON PAYMENTS DELAYED FOR ARCHITECT'S APPROVAL OF WORK.—In the Lord Mayor's Court on Tuesday week, before the Recorder (Sir Charles Hall) and a jury, an action was tried in which Geary, Walker, and Co., of Queen Victoria-street, E.C., sought to recover from Henry Young, builder, of East Grinstead, the balance of a debt incurred for wood-block flooring at an isolation hospital being erected by Mr. Young for the East Grinstead Urban Council. Mr. Glynn appeared for the plaintiffs and Mr. Hodges for the defendant. Mr. Glynn said the original claim was for £81 ls. 11d. for 295 superficial yards of wood-block flooring laid down at the East Grinstead Isolation Hospital. Two sums had been paid on account, leaving £15 ls. 11d. now sued for. The defendant claimed to be entitled to a deduction of 5 per cent. from the full amount in accordance with the terms of the order, but the plaintiffs contended he was only to be allowed this for a cash payment, and as he had not yet paid he was not entitled to any discount. The work was done in June and the account was rendered on July 28. The defendant claimed that he was not liable to pay until the architect had approved of the work, and such approval had not been expressed when the action was commenced. When the order was originally given, the plaintiffs wrote to Mr. Young on May 6 suggesting the form of an official order, and it was accordingly sent the following day in these terms: "Please proceed at once with 2in. deal flooring at 5s. 3d. per yard, less 5 per cent., the same to be laid to the satisfaction of the architect." Accordingly the work was done and the bill sent in. The defendant should have paid the money and then, if the architect expressed disapproval of the work, he should have brought an action against the plaintiffs to recover back the money he had paid. As to the claim for 5 per cent. discount, it was simply ridiculous and was so explained in the letters. On May 8 the plaintiffs wrote Mr. Young acknowledging receipt of his order at the price of "5s. 3d., less a cash discount of 5 per cent." On June 10 defendant wrote them, "My agreement with you is 5s. 3d., less 5 per cent. for cash, and I am prepared to carry out my part if you will do the same. Unless you send at once to finish the work I shall be obliged to get someone else to do it." On receipt of that letter plaintiffs sent men at once to do the work; but the foundations were then damp and the plaintiffs took their men away again at the request of the defendant. A part of the work, to the value of 12s. 6d. was not done, but this was defendant's own fault, for the hearth tiles had not been set, and the defendant told plaintiffs' workmen they need not trouble—he would see to that little part himself. Now he sought to take credit for this 12s. 6d. On August 5 Mr. Young replied, "I am only waiting for the architect to pass the flooring and I will at once send you a cheque, but I can't think of paying for work you have not done." Included in the demand was one item for £3 13s. 2d., more flooring having been sent down than was required, but this portion of the claim the plaintiffs now abandoned. On August 6 the plaintiffs wrote to Mr. Young, "Our contract is with you and not with the architect." Mr. Young answered the last letter by saying, "I am surprised at your action, as you undertook to do the work to the satisfaction of Mr. Gale, and as soon as his certificate is forthcoming I am prepared to pay." Thereupon the plaintiffs demanded a cheque by return, and defendant wrote, "I have not been able to get the architect here; perhaps you or your traveller (Mr. Mayo) will write him and hurry him on." On September 4 plaintiffs' solicitors communicated with Mr. Young, and on September 6 they received a letter from Mr. W. W. Gale, who wrote that he was much surprised at their threatening Mr.

Young with an action, as he (Mr. Gale) had not yet certified that the flooring had been laid to his satisfaction. It was most unpleasant for an architect to insist on a certain firm being employed and then for friction to arise between that firm and the builder. He was going to East Grinstead the next day and if the work was satisfactory he would issue his certificate. Mr. Young next wrote setting forth his objections to the account, inclosing a cheque for £36, and admitting a further sum of £6 18s. 10d. was due to the plaintiffs. He intimated at the same time that the architect could not pass all the plaintiffs' work. The plaintiffs wrote back declining to accept the cheque and saying that unless the balance was paid by return the action would go on.—The Recorder here interposed and said he must decide that both the cash payment and the architect's approval should be within a reasonable period. The defendant was not liable to pay until the certificate was given, if it were given within a reasonable time, and he was then entitled to deduct his cash discount if he paid within a reasonable time.—Mr. Glynn: Your lordship will give me leave to appeal on that point?—The Recorder: No, certainly I shan't.—Mr. Glynn: My clients are desirous of getting an opinion from the Divisional Court, as a large number of contracts are similar to this, and it is a most important point.—The Recorder: I can't give leave to appeal in a case in which I entertain no doubt whatever. It would be a farce to send a case to the Divisional Court on a document which, to my mind, is absolutely clear.—Mr. Glynn: There remains then the question whether the certificate was given within a reasonable time and there is the point with regard to the 5 per cent.—The Recorder: The latter point holds good with the other, having held, as I do, that the work must be done to the satisfaction of the architect. Defendant seems to have taken ordinary means to get the architect there.—Mr. Glynn: You say, then, that two months is a reasonable time?—The Recorder: Yes, I say that; but if you think it worth while, go to the jury on that point; but if the architect says he is not satisfied, it will only date from the day that he is. I don't see what you will get beyond what is paid into court.—Mr. Glynn: I must take the opinion of the jury on the question of reasonable time.—Mr. Hodges: We have no control over the architect. If the architect won't certify we cannot compel him to.—The Recorder: Suppose he withheld his certificate for ten years, do you say you would not have to pay until then?—Mr. Hodges: Certainly I do, and I will give you authority.—The Recorder, having read the case handed up to him, said it clearly took away from the plaintiffs all right to argue as to reasonable time. The defendant was not bound to pay until the architect was satisfied at the way in which the work had been done. There would be a verdict for defendant with costs, leave to appeal being refused.

A QUESTION OF QUANTITIES.—At the Bradford County-court on Friday, Alfred Shackleton, butcher, of Bradford Moor, sought to recover £30 7s. 6d. from Joseph Coates, of Vignola-street, Bradford. It was alleged that in certain specifications of excavations for which the defendant contracted, the number of yards required was put at 552 instead of 309, and the plaintiff claimed to recover the amount which he alleged had been overpaid. His Honour (Judge Bompas) held that the defendant had complied with the plans, and was not responsible for any mistake. Judgment was accordingly entered for the defendant.

ALLEGED INTERFERENCE WITH ANCIENT LIGHTS.—In the Chancery Division of the High Court of Justice, before Mr. Justice Kekewich, the action of "*Hall v. Ogden*" was heard on Friday and Saturday. It was an action brought by the plaintiff as the owner of a dwelling-house, a shop, and other premises, situate in Leeds-road, Windhill, Shipley, to restrain the defendant from building in that road in such a manner as to obstruct the plaintiff's ancient lights.—Mr. Renshaw, Q.C., in opening the plaintiff's case, said the fact that the plaintiff's lights were ancient was not disputed. The plaintiff not only asked for an injunction to restrain the obstruction, but also for a mandatory order to pull down a piece of wall which had been erected by the defendant. His Lordship had previously granted an interim order restraining the defendant doing what was complained of, but declined to make a mandatory order to pull down the wall that had been erected by the defendant. Since his Lordship had made that order the defendant had done nothing but pull down a few bricks, and had not in any way done anything to abate the interference. The plaintiff complained that the access of light to two of his windows in particular had been interfered with. Down to the year 1894, said the learned counsel, there was near the new wall of the defendant a public pathway. In that year an arrangement was come to with the local authority by the defendant, by which another public footpath was substituted for it, and defendant was allowed to take possession of the ancient footpath.—Mr. Justice Kekewich, in giving judgment, said that the evidence showed that things now remained in precisely the same position as they did when the

matter was before him on interlocutory application. The plaintiff complained of the obstruction of access of light to two rooms, one a scullery—a long, narrow, and obviously very badly lighted room. The little light it had originally must have been of great value to it. Upon the evidence it was clear that there had been, by the erection of the wall to its present height, a material interference with the access of light to that window—material in this sense, that there had been a large proportion of that light taken away. As regarded the other room, there was a little more difficulty; but also with reference to that room the defendant's witnesses admitted that there had been some interference with the access of light, but they said it was inappreciable and could not be measured. Putting the evidence of the experts one against the other, he should say that there had been a sufficient interference with the access of light to justify him in giving judgment for the plaintiff. The plaintiff was entitled to an injunction, and the injunction must be both prohibitive and mandatory, so as to prevent the access of light to the two rooms being continued. The wall must be removed, and the defendant must pay the costs.

THE PAVING OF LONDON FORECOURTS.—At the Southwark Police-court on Saturday, Mr. Slade, the magistrate, dismissed, after four adjournments, a summons taken out by the Bermondsey Vestry against S. G. C. Sansom, the owner of a large property in South London, to compel the paving of the open spaces in front of three houses in New Church-street, Bermondsey. The object of the vestry was to treat these instances as test cases, preliminary to compelling the tenants of a number of other houses in the street to do away with their front gardens. The houses in question are tenanted by the working classes, and were built six years ago under the supervision of the district surveyor and vestry, and are alleged to comply with all modern requirements of construction. In front of each house is a small forecourt, railed in with iron railings, and it was contended by the vestry that the rain percolated through the earth in these forecourts, and found its way into the houses, thereby making them damp. Mr. Bodkin, however, who appeared for the defendant, Mr. Sansom, contended that, inasmuch as there were three courses of footings—a proper damp-course, a bed of concrete 6in. thick under the floors, and a cement plinth between the brick wall and the ground running from the footings more than 1ft. above the level of the ground—it was impossible for damp to get into the houses, and the expert evidence given by Mr. Hewitt, district surveyor of Southwark, Mr. Woodward, district surveyor of Lambeth, Mr. Gruning, surveyor to the London County Council, Dr. Farr, of Kennington, and the evidence of the tenants who had lived in the house for six years, led the magistrate to believe that no grounds existed for saying that there was damp or anything approaching a nuisance "injurious or dangerous to health." The summons was issued at the end of April, 1897, to abate a nuisance "injurious or dangerous to health," and was dismissed six months afterwards, and cost the owner over £100 to oppose, towards which the vestry do not pay a penny.

BUILDER V. BRICKMAKERS.—"GOOD, CLEAN, WELL-BURNT" BRICKS.—At the Stockport County Police-court, on October 23, before Judge Yate Lee, an action was brought to recover £70 12s. 8d., the sum alleged to be due by Denis Mulaney, builder, of Heaton-lane, for goods sold and cartage to the plaintiffs, Moore and Bristow, brickmakers, of Dalston-lane and Norbury Moor. The case had been remitted from the High Courts. Mr. Potts, solicitor, appeared for the plaintiffs, and the defendant was represented by Mr. Wharton, barrister. Mr. Potts said that in March the defendant had an interview with the plaintiffs, asking them to quote the price of 100,000 checker bricks, bricks which were better than common bricks. On March 12 plaintiffs wrote quoting the price as 18s. 6d. per 1,000 net. These bricks were wanted for the construction of twelve houses in three rows of four houses each in Bramall. Plaintiffs' usual price for these bricks was 20s. per 1,000, but as they had a stock in hand, and the job was near by, they gave the lower quotation. On the 17th defendant wrote saying he wanted the plaintiffs to commence sending the bricks which had been quoted. On the 23rd defendant wrote confirming the price of 23s. per 1,000, for "good, clean, well-burnt bricks, not common," delivered, and asking for the supply to be commenced at once. When the money became due for the first month's supply Mr. Bristow called upon the defendant for the money, but did not get it. Defendant wrote on April 17 saying that he would forward the account the following week-end if found correct. He also wrote calling attention to the bricks they were sending, and stated that he learned they were raking up all the old stuff which they could find about the yard, and the architect had been grumbling about it. That was the first and only complaint received by the plaintiffs, who replied expressing surprise at the complaint. The total amount of bricks supplied to the defendant on this job was 223,800. On May 17 plaintiffs wrote to the defendant stating that as he had slightly exceeded the 100,000, they

could not supply him with any more bricks at the reduced price, and that they would be glad to supply him at the usual price of 20s., less 2½ per cent., and that they could also supply him with a few common bricks at 17s. 6d. In his affidavit defendant described the bricks as spoiled by exposure to bad weather, badly burnt, cracked, and rotten, and yet on May 18 he wrote expressing surprise that plaintiffs intended stopping supply. He made no complaint about the quality of the bricks. In the first instance the quotation had been for 100,000 "or more," but before the acceptance of the contract the quotation was for 100,000. On the last date named defendant wrote that he thought they ought to supply him until the Bramall job was completed, and that it was not fair to break with him now that he had worked up their old stock and they could get a better price for them. The plaintiffs replied that they had not intended supplying defendant with checkers for good, and that they did not think he had had 10,000 of the old stock. They generously offered to continue supplying until the Bramall job was finished. By May 31 he had received 186,500. Mr. Bristow expressed surprise that the defendant had not sent the promised cheque. Defendant regretted not having been able to forward the cheque for the amount due, but said that he would forward it before the week-end. On June 8 plaintiffs wrote that unless they received the cheque per return they would stop the supply. On June 9 he sent a cheque for £80, and wrote saying that he had about 40,000 bricks on the ground. With the defendant it had been simply a matter of procrastination from beginning to end in payment and in everything. The defendant had been supplied with 228,800 checkers. Mr. Bristow was called and spoke as to the contract and the quality of the bricks supplied. John Brown, plaintiffs' foreman, denied that any bricks similar to those produced by Mr. Wharton had ever been sold as checker bricks. They might have been included in the common bricks. Mr. W. L. Atkinson, Lumb-lane, Bramall, builder, said he would not like to say whether it was an unusual thing to allow so large a quantity of bricks to remain about the ground on a job like that at Bramall. Mr. Peter Pierce, architect and surveyor, Stockport, said Moore and Bristow's checkers had been used on the outside walls at the back and gables. They had been used inside as well. About five-sixths of checkers were Moore and Bristow's. There would be about 61,650 bricks used on the outside, of which 50,000 were Moore and Bristow's. It would be impossible to use 109,500 checkers for the outside walls. Moore and Bristow's checker bricks were as good as any in the town. A large number of the plaintiff's checker bricks had been used inside. Some of them were splendid bricks, and others were not fit to be used outside. Mr. Wharton said they did not dispute that 50,000 of Moore and Bristow's bricks were used outside. It was admitted by Mr. Pierce that some of the bricks used on the inside were not fit to be used outside. Those bricks were not according to the terms of the contract, and they were entitled to reject them. The only question left was as to how many. His client had complained time after time, day after day, and plaintiffs had said they would make the allowance. The witnesses had stated that they had taken the greater part of the bricks from the stack. The defendant wanted "good, hard-burnt bricks," and he had not had them, he contended. Defendant stated that of 7,500 sent to St. George's Vicarage none of them were fit for outside work, and 700 of them were not fit for use. The rest were used as common bricks for inside work. His loss by this would be about £2 12s. 6d. Of 230,000 checker bricks supplied at Bramall 182,000 were bad ones. His loss on these would be about thirteen guineas. He had also to buy 59,000 bricks for the front, at a loss of 1s. 6d. per 1,000. Owing to the wetness of the bricks supplied by the plaintiff, he had to repoint 250 superficial square yards of the outside wall at a cost of 1s. 3d. a yard. He (defendant) had not left the bricks lying about more than was usual. He estimated his loss at £35 8s. 3d., which was rather underestimated than anything, and this amount he had wished to deduct from the plaintiffs' account. He saw Mr. Bristow every few days, and on each occasion he complained as to the quality of the bricks. James Jepson, the architect in connection with the Bramall property, said he had occasion to complain about some of the bricks, as they were not fit for outside use. He did not know where the bricks which he objected to came from. It appeared that £34 4s. 2d. had been paid into court, and his Honour said he would give his judgment after going through the correspondence.

RE MATEO CLARK.—Under a receiving order recently made in this case, the debtor being described as of Dashwood House, New Broad-street, railway contractor, it is stated that the liabilities amount to about £100,000, the value of the assets not yet being ascertained. The debtor is stated to have been interested in the construction of railways in South America.

CHALK REMOVAL FROM A BUILDING ESTATE.—**HUTCHINS V. THE SEAFORD BAY ESTATE COMPANY.**—The hearing of this case took place before Mr.

Justice Stirling on Friday and Saturday. The plaintiff, who recently purchased some building land at Seaford, sought to restrain the defendants who were developing an estate there, from working and taking chalk on the plaintiff's property in such a way as to materially interfere with his enjoyment of the land. It appeared that some years ago, before the plaintiff purchased the property, the then proprietor granted a license allowing the defendants, under certain conditions, to dig and take chalk from the land for a limited period, subject to his approval, in order to construct a sea wall and for other purposes. The wall was practically completed in 1895. Towards the end of 1896 the plaintiff, having purchased the land, gave notice to the defendants that the license to take chalk would come to an end in April, 1898. When the plaintiff subsequently went down to visit the estate, he found that the defendants had laid down a light railway over part of his land, and was using a locomotive upon it, with the result that they blocked up a road leading to the plaintiff's property. Under these circumstances, the present action was brought. Mr. Buckley, Q.C., for the plaintiff, submitted that, according to the terms of the license, the plaintiff's approval was necessary as to the manner in which the chalk was to be removed, and this had not been obtained. The plaintiff was, therefore, entitled to an injunction. Mr. Butcher, Q.C., for the defendants, said that he was prepared to enter into an undertaking to divert a part of the railway, so as to enable the plaintiff to use the road. But he contended that the defendants were entitled to use a locomotive, as that was the only practical way of removing the chalk. Mr. Justice Stirling, in giving judgment, said as the defendants had given an undertaking as regarded the road, it was only necessary for him to decide what were the rights of the parties under the existing license. He came to the conclusion that the plaintiff had good ground for bringing the action, and objecting to the use of a locomotive, for there were other practical ways of removing the chalk. He should grant an injunction restraining the defendants from using a locomotive in the future, or in taking the chalk in any way not approved of by the plaintiff. The order for an injunction was, however, suspended for a week.

CHIPS.

The newly-founded Sir John Buchanan gold medal of the Royal Society is to be awarded to Sir John Simon, F.R.C.S., for his labours in the interests of public health.

The members of the town council of Tunbridge Wells paid an official visit last week to the Northern Sewage Farm, which has just been extended from plans by and under the direction of Mr. T. W. Mellor, the borough engineer. The total cost expended has been over £30,800, including £12,050 for the purchase of land by compulsory arbitration, £6,244 for a sewer 5ft. in diameter and nearly a mile in length, and £2,000 for a low-level sea.

Colonel A. G. Durnford, R.E., held an inquiry at Morley, on Friday, concerning an application made by the town council for powers to borrow £8,000 for the purposes of public baths, and £550 for works of sewerage and the paving of Corporation-street.

The two local branches of the Associated Carpenters and Joiners have decided to withdraw from the Aberdeen Trades Council. The men declare that it is useless sending delegates to a body which, by its action, misrepresents the views of the general mass of workers on public questions. The case is instanced of the president's position with regard to the litigation over the erection of Westfield School.

The pulpit in St. Nicholas' Church, Harwich, has just been replaced by a new one of wainscot oak, hexagonal in form, and Early Perpendicular in style; it has been carved and executed by Mr. T. Stopher, Falan-street, Ipswich.

A Local Government inquiry was held by Mr. W. O. Meade King at Newport, Mon., on Friday, into the application to borrow £21,000 for extending the town-hall, and some smaller amounts for other purposes.

By a decision of the Bournemouth Town Council, the suburb of Boscombe will shortly possess a piece of open space on the cliff front, Lady Shelley's offer of six acres of foreshore and cliffs having been accepted with some unimportant conditions. This is the first opening out of the overcliff for the public use to the east of Boscombe Chine.

The directors of the Cambrian Railways Company have just formally appointed Mr. Alfred J. Collin, M.I.C.E., of Darlington, to the responsible post of engineer to their railway system, in succession to Mr. George Cowen, resigned. Mr. Collin, who is only 35 years of age, has occupied the position of chief assistant to the divisional engineer of the North-Eastern Railway, at Darlington, for seven or eight years, and is the son of Mr. Thomas Collin, assistant general manager of the Lancashire and Yorkshire Railway Company.

Our Office Table.

THE 144th session of the Society of Arts will be opened on Wednesday evening next, when an address on "The Colonies: Their Arts, Manufactures, and Commerce," will be delivered by Major-General Sir Owen Tudor Burne, G.C.I.E., K.C.S.I., Chairman of the Council. Amongst the subsequent lectures to be delivered is one by Dr. Samuel Rideal on "The Purification of Sewage by Bacteria," to be given on Dec. 15, and others arranged for after Christmas are: "Stage Mechanism," by Mr. Edwin O. Sachs; "The Recent History of Papermaking," by Mr. Clayton Beadle; and "Fireproof Construction," by Mr. Thomas Potter. Mr. Cyril Davenport will deliver a course of three Cantor lectures on "Decorative Bookbinding" on Jan. 24, 31, and Feb. 7; and Mr. Hugh Stannus, F.R.I.B.A., will give another Cantor series of four lectures, entitled, "The Principles of Design in Form," to be read on Feb. 14, 21, 28, and March 7.

THE Archæological Society of Athens has, it is reported, decided to resume the works for the restoration and strengthening of the ruins of the Parthenon. The English company which is working the marble quarries at Pentelicos has offered, for the purpose, marble blocks of excellent quality and large size. It is declared that the fears which have been expressed regarding the structural solidity of the Olympian Museum, where the famous statue of Hermes by Praxiteles is deposited, are quite groundless.

At Tuesday's meeting of the London County Council, the Fire Brigade Committee reported, with reference to the work for enlarging and altering the Hampstead Fire Station, that four tenders had been received, the lowest of which exceeded the architect's estimate of £4,170 by £785. The work had been offered in July to the Works Department, but the manager was not satisfied with the amount of the estimate. The firm submitting the lowest tender stated in their tender that if the work were carried out under the general conditions for building contracts agreed upon by the Royal Institute of British Architects and the Builders' Society, and adopted by the Central Association of Master Builders of London, the firm's tender would be reduced by 5 per cent. The firm also added that it would require the clause in the form of contract as to payment altered. The architect stated that £100 of the difference was attributable to the rise in labourers' wages which took place in June last, but, having looked over the bills of quantities of the lowest tenderer, he found that some items were priced at rates which, in his opinion, were excessive. The committee recommended that neither of the tenders should be entertained. After some discussion, it was decided to refer the matter back for further consideration, to include the causes which had led to the tenders exceeding the estimate by so large a sum. On the recommendation of the Highways Committee, the Council decided to expend £8,500 on certain junctions and extensions in the tramway system recently purchased from the North Metropolitan and London Street Tramways Companies, and subsequently leased to the first-named company. It was also agreed that it is desirable that the Thames Embankment should be continued from the Victoria Tower-Gardens to Lambeth Bridge, and that it be referred to the Improvements and Bridges Committees to report generally upon the subject.

THE annual meeting of the Egypt Exploration Fund was held on Wednesday afternoon at the hall of the Zoological Society, Hanover-square, Sir E. Maunde Thompson presiding. The reports of the treasurer and secretary were presented, and the chairman said the year had produced some remarkable discoveries. The work of clearing the temple of Deir el Bahari was one of which they might be proud, but much still remained to be done there. During the year the artists had continued the work of copying the bas-reliefs, and some progress had been made with the work of repair. In the coming year they proposed to complete the replacing of the blocks of the Punt expedition, to rebuild the columns of the Punt terrace and the wall leading up to the Hathor chapel, and to rebuild the great retaining wall which protects the temple from the debris which fell from above. Professor Petrie, after settling Mr. Grenfell and Mr. Hunt at Oxyrhynchus, settled himself on the site of Deshasheh to bring

to light the curious burial customs of the Egyptians of the fifth dynasty. The successes at Oxyrhynchus were remarkable, and the fortunate discovery of the fragment of the "Logia" at once arrested public attention. The wonderful find of papyrus, mostly Greek, surpassed the most sanguine expectations. Professor Flinders Petrie said that a large district which was quite unknown archaeologically, had been examined this year. He had explored a long district and mapped down all the ancient sites of towns and cemeteries, and finally, settling at Deshasheh, about 20 miles south of Faiyum, he began to explore the cemetery of the fifth dynasty. The historical results were of the greatest interest for the early history of Egypt. They had found a fine group of statues of the fifth dynasty, and had brought to England one of the two best, which was by far the finest piece of Egyptian statuary that had ever reached this country.

The opening meeting of the Auctioneers' Institute was held on Wednesday evening, Mr. W. E. R. Peck, vice-president, in the chair, at 57, Chancery-lane, when Mr. James F. Field, the president, delivered his inaugural address. He said that the progress of the Institute had been rapid, and its prospects were encouraging. During the twelve months ended Oct. 31 last, 131 new members were enrolled, as compared with 98 in the preceding twelve months, and their income had increased nearly 35 per cent. A lending library had been established, and the examinations had been highly successful for so young an institution. During the past year a much-discussed subject had been that of land registry. He did not think that the Land Transfer Act of last Session was likely to definitely and satisfactorily settle the matter of registration. After mentioning that there was now a better demand for agricultural land than had been the case for some time past, and alluding to the recent increased demand for freehold ground-rents—a class of investment which had risen in value 25 per cent. in the last quarter of a century—he criticised adversely the action of the School Board for London in notifying to those whose property it wanted to take compulsorily that it would not consent to pay the fees of agents or surveyors. A vote of thanks was passed to the president for his address, on the motion of Mr. D. Young, seconded by Mr. R. Appleton. During the evening Mr. George Brinsley was presented with a silver-gilt replica of the president's badge and chain.

The 75th annual report of the Commissioners of Woods and Forests states that the income derived from sales of forest produce in the New Forest amounted in the year 1896-97 to £7,355 4s. 11d., in addition to surface rents amounting to £3,099 11s. 8d., the corresponding receipts in 1895-96 being £7,060 12s. 7d. and £3,014 13s. respectively. In the case of Dean Forest the same sources of income produced £5,305 17s. 7d. and £1,856 12s. 11d., as against £6,539 3s. 10d. and £1,959 6s. 1d. in 1895-96. The mineral royalties of Dean Forest for the year ending March 31 last reached a total of £13,906 19s. 7d., as against £12,332 10s. 8d. for the preceding year. The greater part of the oak woods, the report says, have arrived at an age when the income derived from their thinning may be expected to be less than heretofore for some time to come, and the system of management which was best when the oak was grown specially for the purposes of the Navy, requires reconsideration now that it is no longer devoted to the building of ships. It is suggested, therefore, that it is desirable to produce other kinds of timber for which there is a market, and to utilise the oak already planted according to present-day requirements. As to other parts of the United Kingdom, the report states that Crown property in Scotland produced during the year an income of £24,737 16s. 1d.; in Ireland, £37,954 8s. 4d., consisting mainly of quit rents; in Wales £15,107 12s. 1d.; and in the Isle of Man, £5,654 7s. 5d.

The northern district meeting of the Association of Municipal and County Engineers will be held at Sunderland on Saturday in next week, the 20th inst. After a reception of the members in the Council-chamber by the Mayor, the following papers will be read:—"Notes on the Specifications of Tyneside Roads," by Mr. H. W. Taylor, A.M.I.C.E., engineer and surveyor to the Newburn Urban District Council; and (a) "Housing of the Working Classes," (b)

"Technical Schools," (c) "Hospital Pavilion," by Mr. R. Rounthwaite, A.M.I.C.E., borough engineer, Sunderland; "The Sunderland Electric Generating Station," by Mr. F. J. C. Snell, A.M.I.C.E. In the afternoon the visitors will proceed by tram to the Roker Pier Works, cross river by boats to South Docks and view installations of gas-driven pumping machinery at the graving-docks, and thence proceed to the South Pier Works and inspect the concrete and block-making plant, &c. The members will be conducted over these works by Mr. H. H. Wake, M.I.C.E., engineer to the River Wear Commission. They will also drive to the electric generating station, which will be explained by Mr. F. J. C. Snell, A.M.I.C.E., and proceed to the corporation swimming and slipper baths and washhouse in High-street West. In the evening the members dine together at the Grand Hotel.

MR. JAMES MACDONALD, LL.D., delivered the first of a course of Rhind lectures in Archaeology at the National Portrait Gallery, Edinburgh, on Monday afternoon. The subject of the series is "The Evidence for a Roman Occupation of North Britain." Dr. Macdonald began by explaining how it had become desirable that the nature and extent of the occupation of North Britain by the Romans should be examined anew. Of late years the study of archaeology had been marked by the application to it of more strictly scientific methods. But criticism on long-accepted views of our Roman period was partial and incidental. The evidence naturally fell under two heads—the literary or historical and the archaeological. The first literary witness to be called was the historian Tacitus, the merits as well as the defects of whose "Life of Agricola" were pointed out. In the course of his northern campaigns, Agricola advanced beyond the Forth and Clyde isthmus, finishing them A.D. 84 on the battlefield of Mon-Graupius, the position of which was uncertain. The Emperor Hadrian, on his visit to Britain, fixed the northern boundary of the province by raising a barrier along the neck of the land which separated the Solway Firth from the mouth of the Tyne. The reign of his successor, Antonius Pius, saw a Roman army again on the upper isthmus, and the erection there, about 141 or 142, of a second vallum or wall by Lollius Urbicus, then Governor of Britain. With regard to the geography of Claudius Ptolemæus, the lecturer stated that Ptolemy's information regarding North Britain, though wonderfully correct, appeared to be drawn from some unknown source or sources. A comparison of his lists of place and other names in what was now Scotland with those found in the classical writers threw doubt on the general belief that he was indebted for all of them to Roman authorities. Relief was thus obtained from the hopeless task of seeking to connect more than a very few with those to be found in the classical writers.

THE Dumfriesshire and Galloway Natural History and Antiquarian Society has concluded a week's excavation on a site on the farm of Raeburnfoot, in the high-lying parish of Eskdalemuir, about fourteen miles above Langholm. It has been matter of local tradition and report that the place in question had been a Roman camp, but there was no satisfactory proof of it, and the society undertook the work of excavation with the consent of the parties interested in the ground. It was not necessary to go to any great depth to obtain clear proof that local tradition was well-founded, as a few feet from the surface various small articles were forthcoming; and, besides, a well-defined road was come across, which was still hard, and gave proofs of its ancient origin. The excavations were carried out under the personal superintendence of Mr. Barbour, architect, Dumfries.

THE State Medicine Syndicate of Cambridge University state in their annual report that they have held two examinations within the year. In April last 37 candidates presented themselves—viz., 17 in Part I. only, five in Part II. only, and 15 in both parts. Four passed in Part I., four in Part II., and 13 in both parts. Three of the four in Part II. only, having previously passed Part I., were included in the list of 18 successful candidates. At the examination in October, 33 candidates presented themselves—viz., 13 in Part I. only, five in Part II. only, and 15 in both parts. Five who passed Part I. only, having previously passed Part II., and one who passed Part II. only, having previously passed Part I., were included in the list of 18 successful candidates.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institute of British Architects. "Notes on Renaissance Architecture in Malta," by A. S. Flower, M.A., F.S.A. 8 p.m.
Leeds and Yorkshire Architectural Society. Address by the President, Geo. Corson. 7.30 p.m.

TUESDAY.—Institution of Civil Engineers. Discussion on "The Manchester Ship Canal." 8 p.m.

WEDNESDAY.—Society of Arts. "The Colonies: their Arts, Manufactures, and Commerce," by Major-General Sir Owen T. Burke, G.C.I.E., K.C.S.I., Chairman of Council, 8 p.m.

Edinburgh Architectural Society. Lay," by J. F. Matthew. 8 p.m.
Sanitary Institute. Discussion on "The Pollution of Water Supplies by Encampments of Hop-Pickers, Casual Workers, Tramps, &c." To be opened by Prof. W. H. Corfield and by Miss M. A. Chreiman. 8 p.m.

FRIDAY.—Architectural Association. "The Planning of High Schools and Endowed Schools for Girls," by J. Osborne Smith, F.R.I.B.A. 7.30 p.m.

Trade News.

WAGES MOVEMENTS.

DEVONPORT.—The dispute regarding "walking time" between Sir John Jackson and the stone masons engaged at Keyham Dockyard extension works at Devonport was settled on Thursday in last week, and the men resumed work on Friday.

PLYMOUTH.—The master plumbers of the Plymouth district have granted their employes an advance of a penny per hour, thus avoiding a strike.

CHIPS.

On Saturday Lord Durham laid the foundation-stone of the Readhead wing of the Ingham Infirmary at South Shields. The extension is double the size of the present building, and will provide accommodation for forty additional beds. The contract for the new wing was secured by Mr. Goodwin, of South Shields, for £5,928, and an additional sum of £1,500 will be required for furnishing.

The ancient cross standing in the churchyard of the village of Longford, Derbyshire, has just been restored. Messrs. Naylor and Sale, architects of Irongate, Derby, who had been consulted, ascertained what the original cross resembled, and under their guidance it has been restored by Messrs. Hems and Sons, ecclesiastical sculptors, of Exeter. The new portion is a monolith of Hollington stone over 7ft. high, and is carried up off the fracture in the old shaft.

According to the *Sydney Herald*, negotiations are being completed for the lease by the New South Wales Government, of about 2,000 acres of timber land near Jervis Bay. The timber found there is especially suitable for road paving. The concession is to include the construction of a railway to the coast.

An adjourned summons, Islington Vestry v. John W. Heeps, came on for hearing at the Clerkenwell Police-court on Friday. The defendant had been summoned, under the 76th section of the Metropolitan Management Act, for deviating from an approved plan for the drainage of a house in Highbury-quadrant, without having given notice to the vestry. The officials of that body admitted that the drain as now laid was perfect. The magistrate, Mr. Horace Smith, expressed strong disapproval of the conduct of the vestry, and finally refused to have the time of the Court wasted any longer, adding, "I will adjourn the case for six months—perhaps for six years."

A new side-chapel which has just been erected in All Saints' Episcopal Church, Brougham-street, Edinburgh, was formally dedicated to St. Mary on Friday. The side-chapel, which cost about £1,300, has been erected from designs by Dr. Rowand Anderson.

One of the most important of recent antiquarian discoveries has just been made at Martres-Tolosane, on the banks of the Garonne. In the course of some excavating operations, several marble statues of exceeding beauty were revealed, and a systematic search has brought to light no fewer than seventeen gods, goddesses, and heroes of the Roman period; and in addition many pieces of mural decorations, bas-reliefs, and glass-work specimens of locksmiths' work, &c. The objects unearthed constitute, in fact, a veritable museum.

Towards the fund for building additions to Charing Cross Hospital on the site of Toole's Theatre and adjoining premises, £34,650 has already been subscribed. It is desired to raise the building fund to £50,000.

LIST OF COMPETITIONS OPEN.

Byfleet—Village Hall and Workmen's Club (£1,500 limit)	25 Guineas	F. C. Stoop, Hon. Sec., Albany House, Byfleet, Surrey	Nov. 13
Southend—St. Alban's District Church	No premium offered; no Assessor named	Rev. E. C. Kimber, Avenue-terrace, Southend-on-Sea	" 20
Edinburgh—Heating and Ventilating City Fever Hospital	Premium not stated	City Superintendent of Works, Edinburgh	" 25
Wells City—Public Hall	£25, £15, £10	Reginald L. Foster, City Clerk, 1, Cathedral-green, Wells, Somerset	" 30
Mexico—Legislature Palace (1,500,000dol. limit)	15,000dol. Mex.	Secretary Public Works, Mexico City	" 30
Cardiff—Town Hall and Law Courts (A. Waterhouse, R.A., Assessor—£200,000 limit)	£500 (merged), £300, £200	J. L. Wheatley, Town Clerk, Town Hall, Cardiff	Dec. 4
City Corporation—Bronze Diamond Jubilee Medal	£20, £15, £10	Sir J. B. Moachton, Town Clerk, Guildhall, E.C.	" 6
Nottingham—Laying-out and Planting Basford New Cemetery	£100, £50	Samuel G. Johnson, Town Clerk, Nottingham	" 15
Nottingham—Workhouse Infirmary (£4,000 limit)	(No first) £15, £5	Geo. Scales, Clerk to Guardians, 35, High-street, Dorking	" 15
Nottingham—Designs for Basford Cemetery Buildings: Chapels, Crematorium, Lodges, &c.	£100, £50	Samuel G. Johnson, Town Clerk, Nottingham	" 15
Menai Bridge—Landing Pier (£3,000 limit)	£40	Thos. Hughes, Clerk, Min-y-Den, Menai Bridge	" 16
Festiniog—Temporary Eisteddfod Pavilion for 10,000 (£900 limit)	10 Guineas	Wm. Jones, Hon. Sec., Pavilion Committee, Blaenau, Festiniog	" 17
Bootle—Fire Brigade and Police Stations (£14,000 and £1,500 limits)	50 Guineas, 25 Guineas	J. H. Farmer, Town Clerk, Bootle, Lancs	" 31
Crich—Water-Supply Scheme (3,100 population)	15 Guineas, 5 Guineas	Joseph Pym, Clerk, Belper	(1898) Jan. 8
Carlton, Victoria—Children's Hospital	£100, £50, £25	J. Nicholson, Hon. Sec., Pelham-street, Carlton, Australia	(1898) 30
Leicester—Motor Refuse Carts	Corporation	E. G. Mawbey, Borough Engineer, Leicester	(1898) 31
Port Elizabeth—Free Library (Assessors, Sir F. Blaine and R. H. Hammersley-Heenan—£20,000 limit)	100 Guineas, 50 Guineas	G. Cettle, Librarian, Port Elizabeth, S.A.	(1898) Feb. 15
New York—Sun Dial (Plaster Model)	500dol., 250dol.	Sec. National Sculpture Soc., 215, West 57th-street, New York	(1898) 28
Newcastle-on-Tyne—New Infirmary (local Architects)	(No first) £150, £100, £50	Secretary Building Committee, Newcastle	(1898) Mar. 1
Belper—Sewage Disposal Schemes	50 Guineas, 25 Guineas	Joseph Pym, Clerk, Belper	(1898) May 1
Tottenham—School Board Offices	—	J. F. Adams, Clerk, School Board Offices, Tottenham, N.	—
Bexhill-on-Sea—Promenade Pier and Garden	—	Secretary, Pier Co., 7, Sackville-road, Bexhill	—
Blackburn—R.C. Infant School, Dean-street	(No first) £5	The Rector, 48, Islington, Blackburn	—
Dukinfield—Town Hall (£7,000 limit)	£40, £20	Samuel Hague, Surveyor U.D.C., King-street, Dukinfield	—
Peterborough—Additions to the Guildhall (£2,500 limit)	£35 (merged), £15	The Town Clerk, Peterborough	—

LIST OF TENDERS OPEN.

BUILDINGS.

Swindon—Two Pairs of Semi-Detached Villas, Springfield-road	T. H. Deacon	W. H. Read, M.S.A., Corn Exchange, Swindon	Nov. 13
Hawes—Market Hall	—	J. P. Kay, Architect, 34, Prudential-buildings, Leeds	" 13
Llandoverly—Residence at Nant-yr-Hogfaen	Thomas Jones	D. Jenkins, F.R.I.B.A., Architect, Llandilo	" 13
Leeds—Twenty Houses off Harehills-road	S. A. Croydon	D. Dodgson, Architect, 86, Albion-street, Leeds	" 13

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2237.

FRIDAY, NOVEMBER 19, 1897.

PRINCIPLES, NOT STYLE.

WHAT would be said of a man who cultivated the style of a particular author, but neglected the plainest rules of the language? And yet his case is very like that of many architects of the present day—they are neglecting principles for style or for a particular school. A man who is always studying the outside of buildings, interesting and useful as such a study is as a branch of art—is only learning one half, and that a not very important part, of architecture. A draughtsman may copy an Italian window, dressings and pediment and all, without having the faintest idea of how the proportion of width and height of opening was arrived at, what the architraves are intended to represent, or why such a kind of moulding and ornament are used in its decoration; or an architect may put over his building a roof imitated from a French château, and yet not know why he selected the form of roof except that it is French and is pleasing. He may also apply a kind of ornament and detail that he knows nothing about as to their origin. Such a man is oblivious of first principles, if he understands them at all; he allows his love of mere style to dominate over his common sense, which is what many do. But a man imbued with the principles of his art, who has studied the reasons and motives of design and is a master of the materials, could not possibly do his work in this way. He would go to the foundation and proceed from premises and data which are fixed and universal in their application and evolve something independent of all accidental forms. Taking materials and structural principles based on statical considerations as the very foundation of his design, he would make these subservient to the uses of his building. Questions of proportion and expression would next guide him in the distribution of the solids and voids of his building, and the massing and grouping of the parts, the disposal of suitable forms of detail, mouldings, and ornament.

Unfortunately for architects, first principles have been discredited of late. A number of theorists and faddists have pretended to have discovered certain properties and analogies of numbers and geometrical figures as being universally applicable to buildings; and, owing to this, a suspicion has been aroused that they are misleading. So-called architectural "Gnostics," or knowing ones, have from time to time arisen, presuming to teach something new, and they have generally done so by attacking the citadels of orthodoxy, by declaiming against all traditional teaching, but without proving the soundness of their theories by practical demonstration. The lack of examples to prove the soundness of these ingenious theories has therefore been prejudicial to them. The modern architect likes to see a reason; but if he cannot see it, he is in the habit of rejecting all theories, however good. And, again, in spite of "harmonic ratios," of proportion, and other subtle theories of design, Mr. Gradgrind finds he can get on very well in his profession. If he can design his buildings in Greek, or Gothic, or "Queen Anne," he is quite satisfied, and does not trouble about any occult proportion, or care to know too much about the origin of features he uses. To be an Agnostic in architecture has at least one advantage, that it avoids any great care for scrupulosity in matters of design. Is it not true that those who affect "Dutch"

and "Queen Anne" do the most monstrous things in architecture, make doorways of absurd width, narrow windows, introduce pediments without piers, defy altogether the usual proportions of columns and pilasters, make them short and stumpy, or "belly" them ridiculously, and, in short, violate every rule of good proportion. A "know-nothing" of subtleties is happier than the Gnostic; he believes in the saying: "Where ignorance is bliss, 'tis folly to be wise." His indifference to fine theories and laws is very convenient, too; as he can do anything he likes—defy a rule on one occasion, and observe it on another.

Nor can it be said that every subtle theory of proportion is absolutely infallible, or that true principles are to be confounded with certain mysterious numbers or ratios. So far from being the case, we find the best results are often obtained in spite of them. Architects and artists who have produced some of the best designs are often ignorant of these theories, and have relied simply on their own intuitive notions of what is right and pleasing to the eye. And this natural and intuitive idea of good proportion is really founded upon a tacit appeal to first principles. Though the real artist does not know chapter and verse, or cannot express accurately or philosophically the canons of architecture as given by Cesariano, Vitruvius, or other later writers who have tried to show a geometrical basis for every building of antiquity, he has the gift of applying pleasing proportions to his work. It is strange with what pertinacity some authors of imaginative genius endeavour to trace all architecture, and theology as well, back to a symbolic and mystic origin. They show there was a canonical art of building, just as there are canonical robes, hours, and other ecclesiastic rites and forms.

Going back to first principles, the architect would soon learn to reject many of the modern modes of building and architecture. Schools and styles would no longer have so great a hold upon him. And what are "first principles" but axioms or truths founded on laws of nature? It does not admit of any question that pleasing proportions are regulated by certain geometrical and simple ratios, that certain forms and lines suggest agreeable emotions—others harsh and displeasing effects; that there is a law of expression which finds a counterpart in nature. Nor will anyone now dispute that beauty in building depends on the observance of these principles or laws; just as in colour we have particular contrasts and harmonies depending in the laws of the solar spectrum. The painter may be able to produce most pleasing colour effects without a knowledge of the laws of light or spectral colours; but even he does so by unconsciously observing laws of mixture of his pigments, or of primaries and their complementaries; or he may be ignorant of the well-known fact that from a mixture of red, green, and violet all possible colours may be produced. The musician, too, whose music sends us into raptures, may not know anything of the physical law of musical chords, nor of Helmholtz's researches; but his harmonies are nevertheless the result of laws. So an architect sometimes plans a good hall on acoustical principles without knowing the laws of that science. These instances only serve to explain the dependence of good building on laws or principles which underlie all types of excellence, and which ought to be learned.

There are principles of planning, of structure, and of material; but few care to find out or apply the underlying principles which have made all great styles. They are satisfied with these embodiments in the concrete, without discovering the abstract principles. It is so much easier to take examples than work out principles. Only a little observation is required to prove that our greatest

architects design their plans on principles, or observe certain points of arrangement that are found to produce the best results. It is needless to show what these are—they are found in every important building, and have been discussed by all leading authorities; but by the majority of the profession they are ignored. Everyone who is master of the subject knows that planning depends on a few principles as much as the design of a roof or a girder; that it is based on certain data as to accommodation. Every room or hall ought to have its proportion of length to width and height; should be lighted according to the use to which it is put, to say nothing of the artistic arrangement of grouping apartments, &c. There are some writers, like Mr. Leopold Eidlitz, who have laid down rules for architects in planning and design, good as far as they go, but for practical purposes of little value. Experience and philosophers like Spencer have taught that we first learn to do things before we know why we do them, and, in short, the power of intuition precedes scientific reasoning, and this is why our theory is always behind our practice, and that our best architects and engineers had been able to anticipate theory. Certain canons and rules have been learned and practised long before they have been explained by science. Take construction: Stable and well-equipoised domes and vaults had been built long before the theories of the arch were enunciated; yet their builders knew very well certain principles of statics from actual experience and failure. The composition and resolution of forces were practically applied by the builders of our Mediæval structures, who could have known nothing of those propositions. Does the modern professor of architecture do so much? He may follow the examples the Gothic builders have left; but has he employed the same initial motive in his design? Viollet-le-Duc has, in his article "Construction" in the "Dictionnaire Raisonné de l'Architecture, Français," given us a graphic description of the admirably poised vaults of the builders of the 12th century—how they produced equilibrium by opposing forces. How did the builders of Notre Dame, Paris, for example, construct their double-aisles round the apse, and so arrange their supports as to occupy as little space as possible round the chancel, and erect vaults over the outer aisles with level summits? They could not have done so unless they knew the forces of thrust and weight, the equilibrium of vertical and oblique thrusts in order to sustain so great a mass on such slender supports. We see the columns of apse crowned by broad capitals on which strong skew-backs take the vaulting shafts and cross ribs of aisles. These enormous weights were borne on columns vertically by the push of flying buttresses inwards. At Notre Dame, Chalons, we find the same concentration of thrusts and vertical load on the column, and we have equally striking examples at Ely Cathedral. But even in our everyday building mechanical principles cannot be ignored. The common solid webbed or lattice girder has to be designed on first principles before they can be made decorative. To find the proper section and depth can only be done by equating the "moments of stress" with those of resistance. The design for a roof of iron or timber implies at least a knowledge of graphic statics, if we are to do justice to our work. But in all these things precedent and style are followed.

Then, lastly, as to materials. No doubt the want of flavour or character in buildings is very prevalent, and why? Because the old rule of using the local material has been dispensed with, and architects never hesitate to erect brick and timber houses in the very heart of stone districts, because it is sometimes cheaper to use imported materials, so much has modern facilities of transport made us independent of locality. In the same way

the limestones of Somersetshire and the sandstones of Cheshire and Lancashire find their way into London buildings, with little regard to suitability. But there are other principles to observe in designing in stone. Yet how few care about them. We find mouldings and profiles used for granite that were originally intended only for soft freestones; the style is only considered. Or the architect adopts sections and mouldings without any reference to their position on or in the building as to height or light. These are common errors in our modern architecture. In other materials a similar deference to style is seen; but we need not trouble the reader with recapitulating them. The man who knows and feels his work will bring intuitive sense into it; he will not undertake a design unless he knows what he is about, unless he sees a motive and a reason why it should be done so-and-so; who will not think of following a precedent or a style unless he feels it expresses truthfully and fully his intention; and it is only the man who has the gift of imagination who can clothe such an idea presentably. The engineer or utilitarian builder knows what he wants, but has no power to express, and the average architect supplies by style what he lacks in imagination.

NEW ENGLISH ART CLUB.

FOR specimens of what has been termed the "advanced" school of painters in which naturalism and so-called "impressionism" are represented, the New English Art Club Exhibition at the Dudley Gallery, Piccadilly, should be visited. That there are a number of experimental pictures goes without saying; at the same time, there is some thoughtful and straightforward work to be seen. The sketches and "notes"—we cannot call them finished pictures—of Moffat Lindner, H. B. Brabazon, Alfred W. Rich, W. Sickert, Edward Sullivan, and Sir William Eden, Bart., are exceedingly good examples of simple expressive brush-work. Especially worthy of notice are H. B. Brabazon's "Murcia" (7), "Canal near Amiens," in which light and atmosphere are conveyed with precision. These are chiefly notes of colour with the brush. "In Venice" is exceptionally slovenly; there is no drawing—simply dashes of colour. One of the best sketches is "Lewes," by Alfred W. Rich (8), firm and vigorous. A. L. Baldry sends two admirable works, both landscapes. One is a broad sketch of a marsh near Christchurch, "Wind Swept"; and the larger picture, "The Hush of Evening," is warm in tone, and broad in the handling of the open meadow-land fringed by dark trees—a study of autumnal greys and browns. Mr. Alfred W. Rich, in "A Sussex Pasture" (14), adopts the reed-pen-and-wash style of the early aquarellists; and we must notice also Sir W. Eden's clever sketch of "London from Waterloo Bridge." W. Sickert's sketch in ink and colour of the "Church of the Barefoot Friars," showing the sanctuary and high-altar, is very spirited.

The lady artists who contribute to the club do excellent work. Mary Hogarth sends two outline wash sketches of Lincoln (21 and 24)—a view of the Cathedral and a distant view, both displaying a sympathetic touch; and Miss Mary Hector's "A Bit of Barbizon" is a charming study of sunlight, admirable in tone. Miss Mary A. Bell is also sympathetic in her work. Amy Draper's "Fishing Boats" (27), Roger E. Fry's "A Sketch in Venice," C. H. Shannon's medallion design "An Infant Bacchus" (25), Charles Conder's brilliant "Sea View," a bay with high cliffs, seen in a hazy light, are all studies of interest. A luminous and clever picture of seaside life is by W. W. Russell (38). A fresh sea dashing on a pebbly beach, on which two or three little girls in white, with tucked-up

skirts, are amusing themselves. Common incident enough; but the painter has imparted life and movement to the scene—strong sunlight on the gleaming surf and white-clad children, also the passing young lady and her charge. Light and breezy freshness and motion are impressed; we lose the commonplace details in the idea of air, light, and movement. William Kneen has also in his "Girl Reading at a Window" (39) given us a pleasing impression of a girl in blue blouse reading a book near an open window. The declining evening light is happily given, vessels in the harbour appear through the open sash, and there is a pleasant dash of colour in the seat and hangings of the semi-darkened room. With the work of Mark Fisher we can always sympathise for its bright and sparkling qualities of light. "A Spring Morning" (60) is, however, spoilt by a spotty effect and want of repose, a defect in some of this painter's work. "An Autumn Evening" (41) also suffers from the same want of breadth. Landscape in its higher qualities comes to us also in the pictures of Wilson Steer, Charles Conder, as in 53, and in the work of Francis Bate, "An Oat Field" and "Through the Trees." There is a freshness in the green foliage, and the long tufts of flowering grass under the trees, the stems of which reflect the sunlight. Arthur Tomson has a pleasing evening effect in his "Walberswick Church" (66), the outline of the noble tower in shadow breaking the sky. "A Summer Night" and "Moon-rise" are both studies in the same poetic vein. Alice Fanner's "Study of a Tree," a large chestnut in bloom; J. Buxton Knight's "Mellow Autumn" (72)—the latter a rich-toned wooded landscape—are pictures of merit. As studies of colour and effect we must also mention Bertram Priestman's picture of a cow and boy, called "Green Meat," and Miss Mary Bell's "A Dutch Garden" (74), in which the scarlet flowers, amidst green and blue, make a vivid contrast. "Regatta Day" (84), by Hugh Blaker, is a luminous piece of impressionism; the crowd of people on the pierhead in nautical attire, white dresses, and scarlet sunshades are cleverly painted, and the artist evidently belongs to the new school of French artists—the *plein air*, so well has he realised daylight and breeze. In the place of honour hangs a large picture by J. E. Christie. This time it is the "Wheel of Fortune," an allegorically treated subject sufficiently clever to take its position. Poised on a wheel which she keeps going with her foot, a fairy in gauzy draperies spins along a road flecked with sunshine and shadow. On one side, a crowd of little children throw flowers on her path, others are pursuing their everyday pursuits, and two little girls in the foreground are examining the petals of flowers. There is much of fantasy in the conception, which is well worked out, and in drawing and colour is rich. Last year the same thoughtful painter gave us a similar allegory under the title of "Bubbles." Other figure subjects are two studies by Edward Sullivan, "My Lady in Yellow" (5) and "The Princess," rather experimental colour themes. P. Wilson Steer's "By Lamplight" (45), a head of a girl with auburn hair, is skillfully painted as a study of artificial illumination; his sunlight and mist in "Knaresborough" (97) is also effective. David Muirhead's "Prelude" is a quiet, restful study of a lady at piano (54). "In the Studio," by A. Belleruche, is a model at a window. The light through white curtains falls delicately on the girl half-draped; and we also notice A. S. Hartrick's "Mariana" (90) in a devotional attitude, good in colour, and a nude figure reading (86), by Douglas Robinson, for its modelling and flesh tints, and a clever colour scheme of a fair-haired girl's head against a blue sea, by Mary A. Bell. Miss Lily Blatherwick, R.S.W., sends two charming studies of Nature, "The Butterflies' Play-

ground" (85), a field of poppies, and "A Cottage Window" (91), both masterful treatments of country blossom. The large, boldly-painted "Quarry," by W. Y. Macgregor (98), Nelly Fisher's admirable group of horses, "Friends" (100), Henry Tonk's "Shadow of the Cliff" (106), the flickering sunshine in P. Wilson Steer's "Oak Avenue," Bernard Sickert's "Tea Time" and "St. Ives Harbour" (112), J. Buxton Knight's "Midsummer Hedgerow" (a powerfully-painted landscape), are other pictures on the walls which show much thoughtful and earnest work, if not always of meritorious execution.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE second ordinary meeting for the present session was held on Monday evening, when there was a large attendance of members and visitors, the latter including several ladies. Just as the President (Professor George Aitchison, A.R.A.), was taking the chair, wearing, in addition to the handsome chain of office presented by the late Professor Donaldson, the Jubilee medal just conferred upon him by the Queen, the electric lights were extinguished, and the room was plunged into absolute darkness. Two pairs of candles were brought in, but, as soon as the preliminary announcements had been read by the secretary, the electric lights were renewed as suddenly as they had gone out.

RENAISSANCE ARCHITECTURE IN MALTA.

A paper on this subject, illustrated by numerous large scale photographs of the principal buildings in Malta, specially taken, and by plans, maps, and drawings, was read by Mr. ARTHUR S. FLOWER, M.A., F.S.A., Associate. Small as it was, Malta teemed, the lecturer pointed out, with huge buildings, the product of centuries of activity and ambition. Churches, palaces, castles, possessed a character unusual, striking, commanding, which rendered it one of the most interesting spots in Europe. The island was composed of one solid block of almost perfect building stone, limestone. A house might be built from the stone cut out from its own cellars, a fortress from its own moats, a cathedral from its crypts. Stone was the one material employed in buildings, and was extensively used for other and many novel purposes, trees being singularly scarce and almost confined to carobs. It might be described as a mason's earthly paradise, and, indeed, the inhabitants seemed to be born masons. No higher testimony could be given to the beauty and interest of the buildings than the enthusiasm they aroused in the cultivated and critical mind of the late Dean Church, who thought Valletta one of the most striking specimens of architecture he had ever seen. Besides the ethnological and geological conditions, the politico-religious influence exerted by the Knights Hospitallers had been an important factor in the architectural development of Malta. Its architectural splendours were chiefly due to them. Relics of former rulers—the so-called Phœnician remains, rude stone monoliths, fragments of Greek and Roman structure, various beautiful evidences of Sicilian-Norman influence—the lecturer passed over as belonging more to archaeology than to architecture. His purpose was to deal with buildings still in regular occupation and use, belonging to a style most conveniently to be described as Renaissance. These were erected during the palmy days of the Knights of St. John, from the beginning of the 16th to the beginning of the 18th century. In explanation of how they came into existence, the lecturer sketched the history of the Order, and the various vicissitudes it passed through from its foundation in Jerusalem, early in the 11th century, till its establishment in Malta. This happened in 1530, when the Maltese islands, at that time little better than desolate barren rocks, were ceded by the Emperor Charles V. of Spain to the Hospitallers in perpetual sovereignty. Fear of Turkish attacks compelled them to devote their first years to necessary fortifications, nearly all to be reconstructed after the great siege of 1565, when the Turks were finally repulsed. The creation of Valletta, a city which suddenly sprang up on a very unpromising site, never before occupied by buildings, was entirely the work of the Grand Master, La Valette. The first

ST. PATRICK'S CATHEDRAL, MELBOURNE.

stone was laid on March 28, 1566, at the corner of St. John's bastion, La Vallette taking up his abode in a wooden hut on the spot, and directing operations day by day until his death in 1568. Del Monte, the new Grand Master, took equally great interest in the work, beginning his term by announcing that no one should enjoy his favour who did not promote the building of the city. At La Vallette's death nothing had been built except the outer fortifications. The first house, interesting as forming the nucleus of the present governor's palace, was built by the Grand Master's nephew, Eustachio del Monte, in the centre of the high ground, on the place occupied by one of the Turkish batteries during the siege, and this formed the nucleus of the present governor's house. In the next year, 1570, the designing of all the works, military, civil, and even ecclesiastical, was intrusted to Gerolamo Cassar, a very remarkable man, whom a document, dated May 18, 1581, refers to as the "ordinary architect and engineer of the Order . . . from 1565 to 1581." The most notable of his numerous works was the church of St. John. In 1571 the headquarters of the Order were transferred to the unfinished city.

VALLETTA PRO-CATHEDRAL.

The lecturer then gave a detailed description, illustrated by numerous photographs, of St. John's, Valletta, and other buildings and architectural features of note in the capital and other parts of Malta. The pro-Cathedral church of St. John was built from designs by Gerolamo Cassar, and consists of a wide and low barrel-vaulted nave, 53ft. across (or with side chapels 118ft. wide) and 189ft. in length. On the north side of the west front are sacristies and the treasury, and on the south side the prior's residence and an oratory. Each bay of the nave opens into a chapel devoted to one of the "langues" of the Order, these side chapels occupying the place of aisles. The Great Hospital

was one of the first buildings erected by the knights, and is noteworthy as containing the largest ward ever built, 503ft. long by 35ft. wide, with a shorter ward of the same width leading out of it. Valletta alone has 24 churches, besides chapels and oratories. Outside Valletta, in the suburbs and country villages, there are a still greater number of churches, together with almost innumerable detached chapels. The latter are mostly octagonal or circular on plan, and domed, with very graceful outlines. The larger village churches have usually two western towers and a dome at the crossing. The dimensions of two typical churches, both dating from the 17th century, are:—Zeitun church, 153ft. long and 111ft. broad, including side chapels, with a nave 31ft. wide; and Zebbug church, 165ft. by 122ft., and 32ft. across the nave. Città Vecchia, or Notabile, originally the chief city of the island, and the scene of St. Paul's sojourn there, is exceedingly picturesque. Its Romanesque cathedral was destroyed by an earthquake about 200 years ago, and the present building, of which Lorenzo Gafa, a Maltese, was architect, was consecrated in 1702. Noteworthy are the nave, upwards of 36ft. in span; the carved and inlaid choir-stalls, said to date from 1480; and the gorgeous altar ornaments and other treasures which escaped pillage by the French in 1798. The lecturer concluded with a few remarks on the characteristics of the architecture of the Order. The term Palladian, applied to it by Dean Church, he considered inappropriate; it was more akin to Early Florentine Renaissance than to any other type. With regard to a suggestion made by Mr. Ingress Bell some 20 years ago in "An Architect's Notes in Malta," that Spanish architects in great numbers were employed upon the city of Valletta, which he thought accounted for the similarity between the architecture of Malta and that of some of the Belgian towns, the lecturer, while granting the

resemblance to Spanish work, particularly in ornament, could find no evidence of the actual presence of Spanish architects. Whencesoever derived, all the buildings of what might be called the heroic age of the Order were exclusively Doric.

A vote of thanks to Mr. Flower was proposed by Colonel LENOX PRENDERGAST, seconded by the Rev. W. K. R. BEDFORD, and, having been supported by Colonel J. R. HOGG, R.E., late commanding engineer in Malta, and Mr. THOMAS BLASHILL, was carried by acclamation.

ST. PATRICK'S CATHEDRAL, MELBOURNE.

ON page 646 *ante* we gave a description of this building, which was opened on Oct. 31. The architect is Mr. W. W. Wardell, F.R.I.B.A., and the cost of the building has been about £150,000. We now give an exterior view of the cathedral, from a photo. by Mr. C. Bayliss, of Sydney, which has been sent to us.

DOVER NEW ADMIRALTY HARBOUR.

THE Lords Commissioners of the Admiralty have accepted the tender of Messrs. S. Pearson and Son (Limited), 10, Victoria-street, Westminster, London, S.W., for carrying out the New Admiralty Harbour at Dover. The works, which are estimated at 3½ millions sterling, consist of (1) an extension of the existing Admiralty Pier in an east-south-east direction for a distance of 2,000ft.; (2) the erection of an east arm extending seaward in a south-westerly direction for a length of 3,320ft. from the foot of the headland, at a point situated 200 yards to the eastward of the south-east angle of the convict prison inclosure; (3) the construction of

a breakwater, 4,200ft. long, which, at a distance of about three-quarters of a mile from the shore, will form on the south the outer sheltering arm of the harbour; and (4) the building of a seawall 3,850ft. in length, extending from the Castle Jetty at the eastern end of East Cliff-terrace to the root of the proposed east arm. For the purposes of this wall a reclamation will take place covering an area of 21 acres, the foreshore between the back of the wall and the base of the existing cliffs being filled in with chalk quarried on the spot. The works to be executed represent a total length of 13,370ft., or more than two miles and a half. The area inclosed will be 610 acres at low water, and of this water area 315 acres will be situated beyond the five-fathom line, and the anchorage will be sufficient to accommodate twenty first-class battleships, as well as numerous vessels of smaller type. The new Admiralty harbour is, on the eastern side, to inclose and protect the commercial harbour which has for some years been in course of construction. As originally designed by Messrs. Coope, Son, and Matthews, the commercial harbour was intended to cover an area of 56 acres, but this will now be increased to 75 acres. Consequently the water area comprised within the two harbours will be not less than 685 acres. Two of the three enormous sheltering arms—the Admiralty pier on the west and the new pier on the east—will constitute magnificent promenades open to the general public.

There will be two entrances to the harbour—one at the extremity of the eastern arm, the other at the end of the Admiralty Pier extension. The former will have a width of 600ft. and a depth of 42ft. at low water of spring tides, or of 60ft. 9in. at high water of those tides. The south breakwater, which will not be accessible to the public, will begin at the southern angle of this entrance, proceeding first in a curve trending in a south-westerly direction, thence following a straight line west by south, and terminating at a point 800ft. from the end of the Admiralty Pier extension. A second, or southern entrance 800ft. wide will thus be formed between the south breakwater and the Admiralty Pier extension, the depth therein corresponding with that of the eastern entrance—namely, 42ft. at low water of spring tides.

Berths for coaling purposes will be provided for a length of 1,800ft. along the inner side of the east arm, the shallow sea being dredged down so as to maintain a uniform depth of 30ft. at low water of spring tides. The reclamation between East Cliff-terrace and the east arm will be used as a workyard during the construction of the harbour. Each of the three main sea works will be a solid structure of concrete blocks, faced with granite above low water. The blocks used in the Admiralty Pier Extension will, as a rule, weigh 40 tons, while those employed in the formation of the east arm and the south breakwater will be 30 tons in weight. All the blocks will be bonded and keyed, or joggled together so as to render the work monolithic in character, and in every case the foundations will be carried down to the solid chalk or flint composing the bed of the channel. The deep foundations will be protected from erosion arising from current action by aprons of concrete blocks laid and incorporated in the sea bed. The works—which will occupy about ten years in execution—will be begun forthwith, under the direction of Major Henry Pilkinton, C.B., R.F., the civil engineer-in-chief appointed under the Naval Works Loan, and of Messrs. Coope, Son, and Matthews, the chief engineers, by whom the design was prepared.

NOTES ON SURVEYING AND LEVELLING.—VI.

By WALTER TESTER.

THE ATHLETIC GROUNDS.

THE plan, Fig. 1, shows the original intention for the New Brighton Tower Athletic Grounds. The idea was to have a football field in the centre of the ground, which would be suitable either for the Rugby or Association game. Around the edge of the football field there was to be a running-track, and outside that a cement cycling track, with a grass verge between the two, with grand and popular stands and banked-up standing-spaces, and all the necessary accommodation for a large crowd of spectators.

The cycle track was to be made as large as the amount of ground available would permit in order

to get long straights; but at the commencement of the work it was only possible to arrange for a cycle track of $3\frac{1}{2}$ laps to the mile, with a 4-lap running track. To enable him to set out the tracks, the surveyor is furnished with the following particulars:—The width of the football field is to be 258ft.; half-width = 129ft.; and as the length of the running track is measured on a line 1ft. from the edge of the football field on the track, the radius of the semicircular ends is 130ft. on this line. The total length of the running track being a quarter of a mile = 1,320ft., and the length of one semicircular end being 130ft. $\times 3.1415 = 408\text{ft.} - 4\frac{1}{2}\text{in.}$, the general dimensions of the track measured on the line are—

Length of one semicircular end..	408ft. $4\frac{1}{2}\text{in.}$
Length of other end	408 $4\frac{1}{2}$
Length of one straight	251 $7\frac{1}{2}$
Length of other straight.....	251 $7\frac{1}{2}$

Total 1,320ft. 0in.

In the same way the dimensions of the cycle track are arrived at, the radius on the line being 160ft. It is not strictly accurate to say that the ends of the cycle track are semicircles; for, as a matter of fact, there is a portion of the curve at the junction with the straight which is of an elliptical nature; but it is sufficiently near for setting out on the original ground, as all the pegs will be disturbed by the excavations, and the tracks will have to be set out accurately on the formation level. Working on this basis, then, $160\text{ft.} \times 3.1415 = 502\text{ft.} 7\frac{1}{2}\text{in.}$, length of one semicircular end, and the general dimensions measured on the line 1ft. from the edge on the track are:—

Length of one semicircular end..	502ft. $7\frac{1}{2}\text{in.}$
Length of other semicircular end	502 $7\frac{1}{2}$
Length of one straight	251 $7\frac{1}{2}$
Length of other straight.....	251 $7\frac{1}{2}$

Total length.... 1,508ft. 6 $\frac{1}{2}$ in.

Width of the running track to be 24ft., and the grass verge between the tracks 6ft. wide all round. Cycle-track to be 29ft. wide on the grand-stand side where the races finish, and around one curved end, and to taper from 29ft. to 25ft. on the popular side, increasing round the other curve until it becomes 29ft. again at the junction with the straight. It should be mentioned that in cycle-racing the riders go round with the lower edge of the track next the verge on the left.

Fig. No. 2 gives the finished sections of the cycle track. The level 84.00 (above Ordnance datum) is to be the same all round on the one-foot line, and on the curve where the track attains the full banking, the outer edge is to rise 8ft. 6in. above that level, the section being slightly round. On the straight the outer edge rises 1ft. above 84.00, the section being a straight line. These levels apply where the track is the full width of 29ft. Where it is not, the section is exactly the same, but with a strip cut off at the outer edge.

It will be supposed that when the surveyor comes on to the ground the exact position the tracks are to occupy is not determined, as negotiations are in progress for some of the adjoining land. The surveyor is required, however, to proceed with the sectioning of the ground, which is of an exceedingly irregular and uneven nature, and is almost entirely covered with trees, gorse, and brushwood. He cannot, therefore, in determining the position of his section-lines, take the tracks into account, except to the extent that he can take a series of parallel sections across the ground square off the S.W. boundary of the estate, and as the longitudinal axis of the tracks is to be parallel to this boundary, these lines will also be square off the tracks.

With the object of setting out the sections, the surveyor commences by choosing a base-line, A B (Fig. 1.), in the only portion of the ground which is at all clear. (See site-plan in Article No. 1.) This line he puts upon his survey-plan, making it square off the S.W. boundary, and he can fix the line on the ground near enough for present purposes by scaling dimensions to any stationary objects on his survey-plan, and setting the measurements out on the site. He then marks two points C and D on this line as far apart as convenient, and in such a position that lines square off the base at these points will have as long a length as possible clear of trees. Having set out a right angle at each point with the theodolite, he must continue these lines through towards the lake end of the ground, using the theodolite for producing the lines over ridges and other irregularities of the ground. In

order to get the lines through he will require the ground clearing, and it will be supposed that he has authority to remove all the trees and brushwood covering the site of the athletic grounds, and that he has set a gang of men to work at the S.E. end, as he proposes to commence his sections at that point. Having continued the two lines through to the far end, a line E F should be run across any open ground between the two to see that they have been produced parallel to each other. As the length of the two lines D E and C F will not be the same, the length of E F will have to be calculated, as the hypotenuse of a right-angled triangle, the two sides of which are (1) the length of C D, (2) the difference in length between C F and D E.

The four sides of the figure C D E F being accurately measured, E F should come out as calculated if the two lines D E and C F are parallel. A check dimension should also be run out to see that C F is parallel to the boundary, and, if necessary, C F and D E will have to be adjusted. They should be near enough for the ground sections, if the work has been carried out at all accurately. Having set the two lines correct in position and parallel to each other, the surveyor can proceed to put pegs in these lines the distance apart of his sections, making them as close together as the nature of the ground requires, and he should number each peg or cut notches in it to agree with the number of the section. The lines can be ranged out by taking the corresponding pegs in C F and D E, and the surveyor can proceed to take the levels, commencing at the end A B, as this portion of the ground will now be cleared of trees and brushwood, and the men will be in front of him. His first object is to set a series of pegs for back sights to command the whole of ground to be sectioned, and he commences by taking a reading on one of the Bench marks previously fixed on the old entrance gate-post. He then sets a peg at a convenient place to serve as back-sight for commencing his sections, driving it firmly into the ground, and taking the level. Using this peg for a back-sight, he next sets his level in a new position, and as the ground is rising rapidly, he places it so that the crosshair cuts near the top of the staff, when it is placed on the peg already fixed, and he then chooses another point to fix a back-sight peg so as to command a large area of ground, and so that the hair of the telescope cuts near the bottom of the staff, driving the peg into the ground firmly, and taking the level as before. Working from point to point in this way, he sets a series of pegs right across the ground, and when he reaches the far end he should finish up on some fixed benchmark, and if he has worked accurately, this level should come out the same as before, when reduced from the first B.M. through the whole series of back-sight pegs. If it does not, he will know that there is some mistake, and can soon run the level over the series again. Having satisfied himself as to the accuracy of all the back-sight pegs, he should have them painted a distinctive colour, and numbered for reference, making a list of their reduced levels. He can now proceed to chain the lines and read the levels, always taking the back-sight reading off one of the pegs at every change in position, as the ground is very uneven. Care should be taken in choosing the situations for placing the instrument; otherwise, a great many resettlements will be necessitated, and there are one or two points which may be mentioned in this respect. Suppose the section lines cross a sudden rise or ridge, the difference in level between the top and bottom of which is beyond the range of the staff, it will save many resettlements if two or three sections are taken together as far as the bottom of the ridge, leaving a peg at a point on the line for recommencing, the instrument remaining in one position. When as many are taken as thought desirable to the foot of the rise, the level can be moved up-hill and placed in such a position as to continue the sections over the high portion, and well down the far side of the ridge. When this part of each section is taken the instrument can be moved down and the lines continued on the other side of the rise, recommencing at the pegs left in temporarily for the purpose.

When working up a sharp rise full advantage should be taken of the length of the staff by placing the level at each change in position, so that the hair will cut as high up as possible on the staff, provided, of course, that a reading can be obtained on one of the back-sight pegs.

It sometimes happens that there is a slight dip

FIG. 1.

in the ground where one or two readings are required, and at which, from the position the level is placed in, the hair cuts above the top of the staff. As the section could otherwise be continued for some distance without resetting, it

instrument can afterwards be set lower down, and the readings taken, care being used to book them down under the correct back-sight, and not in the blank spaces left when chaining the line, as the readings there are taken from a different

FIG. 2.

seems a waste of time to do so for an odd reading or two, and it can be avoided by holding the staff up on a two-foot rule or a short wooden post, and adding the length of the latter on to the reading of the staff. If there are a considerable number

setting. The reduced levels may be filled in after they are worked out.

It is not necessary to commence each section from the same end, and it will save time to take them each way alternately, as the level placed

FIG. 3.

of readings which cannot be taken without holding up, or if the dip in the ground is too great to permit the staff being held up at all, the section can be continued as far as convenient on the far side of the valley, missing the readings at the intermediate points, but booking the lengths on the chain, and leaving a peg or arrow to retain the positions where levels are required. The

for finishing one line will serve for commencing the next. They can easily be plotted looking the same way by starting from the right hand or left hand of the scale.

In sectioning irregular ground it is easy to over-measure the lengths of the lines if the chain is not always held up perfectly level, and it is as well to let the sections start and finish on a

definite straight line, leaving a peg or mark at the ends of each section. In the case of the athletic grounds under consideration, a straight line is fixed on the popular side not necessarily square off the section lines, but better so, at which the chaining of each line starts or finishes, and the length on the chain where the section cuts, each of the lines DE and CF should be noted, and the sections should terminate on the grand-stand side at the boundary of the estate. The lengths between DE and CF should measure the same in each section, and also the distance between CF and the boundary where they are parallel. The length between the line where the sections terminate on the popular side and DE, if they are not parallel, will vary regularly—that is in No. 3 it will be as much more or less as the case may be than in No. 2, as No. 2 is more or less than No. 1. The back-sight reading on one of the pegs should always be looked at twice, once when the level is first set, and secondly just previous to moving to a new position. If the methods above described are followed, there will be little doubt as to the general accuracy of the sections, as the levels of the Bench-marks, the back-sight readings and the chaining of lines will all be checked, and it is very improbable that there can be any serious error. In this way the whole of the ground can be sectioned, and it will be supposed that the surveyor has by this time received instructions as to the position the tracks are to occupy on the site—viz., as shown on Fig. 1. He must at once proceed to set them out, and it will be quite accurate enough for the present purpose if he plots the tracks down correctly in their relation to the section lines, and scales the lengths off the plan to each edge of the tracks along these lines, afterwards setting the dimensions out on the ground. For the extreme ends where the section lines cut the tracks very obliquely, it will be better to use off-sets square off the section lines. The pegs should be painted distinctive colours—say, red for the running track, and white for the cycle track. As the earth-works are being carried out, all these pegs will be either excavated out or buried, and the object they serve is as a guide to the excavator in forming the ground into shape, as, for instance, on the cycle track, he must excavate to something like the right slope required for finishing, allowing, of course, for the pitching and concrete. The surveyor should have a number of trial-holes made at any convenient points on his section lines down on to the rock, and he should take the levels on the surface of same, noting the position of the points on the lines, and he can then get the whole of his sections plotted, putting on both the surface of the ground and the rock (see Fig. No. 3), and assuming some working-level for the football field, he can put on the formation levels for the tracks. He can then make an estimate of the quantity of excavation of sand and rock, and how it is to be disposed of in forming banks for the cycle track and standing space, the question how any surplus is to be utilised being at this time dealt with.

It may be necessary to try several levels for the excavation of the football field before a satisfactory one is arrived at, and pegs should be sunk, or rough screeds fixed up, on the ground at any convenient places, to show the finished surface of the cycle track, in order to see how it will work out on the site. A working-level having been settled, the surveyor can revise his estimate of the quantity of excavation, and he will also be required to give the excavator this level on the ground, which can easily be done by setting off one of the back-sight pegs, adding the reading to the reduced level, and deducting the working level required, giving the reading to which he must set the peg. If operations are to commence in several portions of the site simultaneously, the excavator will require working levels at each place, and the back-sight pegs will be very useful for this purpose, as they command the whole of the ground. The surveyor's next duty will be to replace his section pegs on the formation level as the excavations proceed, and if he can fix any of his lines by marks on any stationary objects, it will be all the better.

All the section lines will be required where there is any rock excavation, and as the surface is bared, the surveyor must take the levels in the same manner as for the original ground. The rock will be required for pitching the running and cycle tracks, and for covering the standing spaces, and any soil on the original ground surface will be used for the football field and verge.

WHEELWRIGHT GRAMMAR SCHOOLS, DEWSBURY.

If there are no sods good enough for the football field, there may be some which will come in for the borders and banks in other portions of the ground, and if so, they will be stripped off and stacked for that purpose. Also many of the trees cut down may be useful for various objects, as for temporary fencing or building rustic bridges or seats. It will be supposed that after the work has progressed considerably, and the ground has been excavated at the south end, that another piece of land is obtained in the south-west corner, and that it is decided to turn the tracks round at right angles with the object of making a larger cycle track. The work done in excavating down to the formation level is not wasted, as the two football fields overlap each other, and it would have been necessary in any case.

QUEEN VICTORIA JUBILEE BOARD SCHOOLS, AND OTHER SCHOOLS, DEWSBURY.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

OUR illustrations give several schools by Mr. J. Lane Fox, the architect: that of the Queen Victoria Jubilee Board School, Dewsbury, was selected in the late competition for these schools. The accommodation provides for 900 scholars in three departments—300 boys and 300 girls are arranged for in the main buildings, and the 300 infants in a separate building. Each block of buildings have street frontages, the playgrounds being arranged in the centre of the site, which, as will be seen, falls very rapidly from one street to the other. Advantage of this fall has been taken to form a basement floor, in which are arranged kitchen and lecture-room for cookery work, and which forms the central cookery school to serve all town schools under the control of the school board. The buildings throughout

are of stone from the Halifax district, dadoes in all rooms being formed with glazed brickwork. The roofs are covered with Westmoreland green slating, and the whole range of buildings are heated throughout on the low-pressure hot-water principle. The contracts have been carried out by local contractors under the direct supervision of the architect.

THE FALL BOARD SCHOOLS, EAST ARDSLEY.

The development of East Ardsley, caused by the erection of engine-sheds, &c., by the Great Northern Railway Company, has rendered it necessary for the school board to erect the block of school buildings shown in our illustration. The site is pleasantly situated about midway between what may be called the old village and the new village. The plan arrangements give provision for 250 girls and 250 infants, with space for boys' department for a similar number of scholars. The boys' school at present now takes up the whole of the old board school, which originally contained the girls and infants, which are now provided for in these buildings. The buildings throughout, and the boundary walls are built of Delph stone. The dadoes in all rooms are in glazed bricks. The roofs are covered with Westmoreland green slates, and the woodwork is in yellow pine, stained and varnished. The heating is on the low-pressure hot-water system.

WHEELWRIGHT GRAMMAR SCHOOLS, DEWSBURY.

This design was selected in a limited competition. The buildings are erected upon a most commanding site on the borders of the town, and quite central for the districts from which the students are drawn. The accommodation provides for 300 students—150 boys and 150 girls. The boys' department is arranged for on the ground floor, and girls on the first floor. In a spacious and well-lighted basement are arranged

the cloak-rooms, kitchen, scullery, large dining-room for students, and the requisite store-rooms, &c. In addition to the customary halls and classrooms, private rooms are arranged for head and assistant-teachers and a chemical laboratory with large lecture theatre and attendant rooms are provided in such a position as to render them central for each department. The management of the schools is in the hands of local governors under a scheme of the Charity Commissioners in London. The amount allowed for building by the Commissioners being somewhat small for so large a building, rendered it necessary that the buildings could only be of a plain, but substantial character. The playgrounds are of the highest capacity, provision being made for cricket, football, and tennis. The buildings and boundary walls are entirely of Halifax district stone. The floors throughout are fireproof, and woodwork, yellow pine stained and varnished. The architect is Mr. J. Lane Fox, Bond-street, Dewsbury.

IMPROVED RADIATORS AND BOILERS.

MESSRS. HAYWARD BROTHERS AND ECKSTEIN, LTD., engineers and iron-founders, of Union-street, Borough, E.C., have introduced several improvements in heating apparatus and boilers. Section 8 of their catalogue contains a description, illustrated, of their "Safford" radiators and "Daisy" independent hot-water boilers. Winter is approaching, and those who are thinking of heating their houses or premises will find these radiators and boilers very economical and efficient. The "Safford" screwed-nipple radiators are made in various patterns and sizes—circular and straight, plain and highly ornamented—to suit public buildings, corners of rooms, positions under windows, forming dining-room sideboards or closets.

WHEELWRIGHT GRAMMAR SCHOOLS, DEWSBURY.

A table is given on each page, with dimensions, heating-surface in square feet, and prices of radiators kept in stock, from which every requirement may be satisfied. The "Safford" radiator is tested to 120lb. to the square inch, and is well adapted for public and domestic buildings, hospitals, and churches. For halls it is the best mode of heating, as a small boiler at the back of a dining-room grate, or from kitchen range, can be used. The right-and-left screwed-nipple connections give a perfect joint. Several very artistic designs are shown in the catalogue. The "Florence," "Favourite," the "Perfect," and other designs are illustrated and priced. These are made of several heights—20in. to 38in. We commend this superior type of radiator to architects and builders, also the "Daisy" hot-water boiler. The latter has a large heating-surface, has no fire-brick, and is easily set up. In this boiler several sections are used, each being an independent heater. It is compact, portable, and slightly in appearance, and most economical in construction, as during spring and autumn a small fire is sufficient to heat the system. The boiler sections and smoke-flues are ingeniously arranged, each section is independently fed, and is employed in the circulation. Full particulars and sections are given.

"A BATTLE ABOUT ARCHITECTS."

THE *Essex Herald* of Tuesday last contains a lively account under the inspiring heading which we quote above. A competition for public baths was held some little time ago at Walthamstow, when Mr. Roland Plunbe acted as referee and awarded the first place to Mr. J. W. Dunford, architect, whose position was confirmed by the District Council, his appointment, we understand, being made under seal. Since these things were done political parties have changed, and the majority now in power seek to nullify the action of the past Council. The only two firms who submitted designs for the baths were

Mr. Dunford and Messrs. Spalding and Cross. The referee reported that although the plans of the latter were in some respects superior, the design by Mr. Dunford was far nearer the money limit imposed by the conditions—viz., £7,000—and consequently the author was awarded the work, subject to the approval of the Local Government Board being obtained, which was done. However, notwithstanding these determinations and resolutions, owing, it would seem, to considerations quite beyond the limitations of the question, such as we have indicated, the obstruction offered to the carrying out of the selected design for the baths has been continued, and at last reached a climax, at least to this extent, by a majority of one on Friday last, when it was resolved to increase the cost of the baths to £8,500, and carry out Messrs. Spalding and Cross's plans. Personalities were freely indulged in as a matter of course, and bad names were called on both sides during a protracted scrimmage which lasted three hours. We do not think the report reflects credit upon the promoters, and it is a matter of regret when architects are concerned in such proceedings. Mr. Dunford's plans we have not seen, and we know nothing of the merits relatively of Messrs. Spalding and Cross's design. On the face of it, however, when a referee has had his award confirmed, we think it is considered a rule among gentlemen to loyally accept such a conclusion as final. As it stands, it would seem that Mr. Dunford has been very badly treated, though, fortunately for him, his appointment, being under seal, cannot so readily be upset by the Highways Committee and their friends. Whatever the legal merits of the case may be, architects and all fair-minded men can have but one opinion on the matter. Professional etiquette is certainly not upheld by such proceedings.

It has been decided to put new roofs on the nave and north and south aisles of Wolvey (near Nun-eaton) parish church at a cost of about £600.

PAINT-MIXING.

(Continued from page 685.)

YELLOWS AND THEIR ALLIED HUES.

- 64.—AMBER yellow: 8 parts medium chrome, 5 parts burnt umber, 3 parts burnt sienna.
- 65.—Bran colour: 40 parts white-lead, 17 parts light chrome yellow, 1 part raw umber, 1 part burnt umber.
- 66.—Bran: 4 parts yellow ochre, 1 part Vandyke brown.
- 67.—Bran, antique: 4 parts white-lead, 3 parts medium chrome, 1 part Vandyke brown.
- 68.—Bronze yellow: 3 parts white lead, 5 parts medium chrome, 1 part raw umber.
- 69.—Buff: 2 parts white-lead, 1 part golden ochre.
- 70.—Buff: 88 parts yellow ochre, 12 parts whitening, 10 parts zinc-white, 1 part plaster of Paris.
- 71.—Buff: Golden ochre.
- 72.—Buff: 2 parts white-lead, 1 part golden ochre or yellow ochre.
- 73.—Buckstone tint: 32 parts white-lead, 1 part raw sienna.
- 74.—Burnish yellow: 16 parts kaolin, 4 parts pulverised soapstone, 1 part Oxford ochre.
- 75.—Chamois: 50 parts white-lead, 1 part chrome yellow, 2 parts vermilion.
- 76.—Cream: 160 parts white-lead, 1 part orange chrome.
- 77.—Cream: Naples yellow.
- 78.—Cream: 400 parts white-lead, 32 parts Oxford ochre, 1 part raw umber.
- 79.—Canary tint: 80 parts white-lead, 1 part lemon chrome.
- 80.—Canary yellow: 6 parts white-lead, 1 part lemon chrome.
- 81.—Copper colour: 20 parts white-lead, 4 parts media chrome, 3 parts Venetian red, 1 part raw umber.

- 82.—Citron yellow: 16 parts white-lead, 12 parts lemon chrome, 1 part light emerald green.
- 83.—Drab: 80 parts yellow ochre, 20 parts whiting, 17 parts zinc-white, 2 parts sulphate of barytes.
- 84.—Drab paint: 42 parts barytes, 3½ parts white-lead, 2 parts English umber, 5 parts boiled oil.
- 85.—Dark oak: 60 parts white-lead, 1 part golden ochre.
- 86.—Dark oak: (groundwork for graining oak) 80 parts white-lead, 1 part yellow ochre.
- 87.—Flax tint: 100 parts white-lead, 60 parts yellow ochre, 1 part lampblack.
- 88.—Flax grey: 60 parts white-lead or zinc-white, 1 part lampblack, 1 part lake.
- 89.—Flesh ochre: 31 parts Oxford ochre, 1 part red-lead.
- 90.—Gold colour: 30 parts white-lead, 5 parts yellow ochre, 1 part orange chrome.
- 91.—Gold yellow: 10 parts lemon chrome, 2 parts orange chrome, 5 parts white-lead. Gold tint: 16 parts whiting, 8 parts plaster of Paris, 1 part Dutch pink (for distemper, not oil).
- 92.—Golden ochre: 9 parts yellow ochre, 1 part medium chrome.
- 93.—Golden orange: 2 parts orange mineral, 1 part golden ochre.
- 94.—Hay tint: 45 parts white-lead, 15 parts golden ochre, 2 parts medium chrome green.
- 95.—Light terracotta (unbaked): 3 parts white-lead, 1 part raw sienna.
- 96.—Light yellow tint: 31 parts whiting, 1 part yellow (for distemper, not oil).
- 97.—Limestone tint: 10 parts white-lead, 1 part golden ochre.
- 97A.—Lemon: 400 parts white-lead, 9 parts medium chrome yellow, 1 part Berlin blue.
- 98.—Lemon: lemon chrome yellow.
- 99.—Maple, ground light: 160 parts white-lead, 1 part yellow ochre. Maple, ground dark: 120 parts white-lead, 1 part golden ochre.
- 100.—Mahogany: 5 parts golden ochre, 2 parts Venetian red.
- 101.—Mahogany ground: 4 parts white-lead, 3 parts medium chrome yellow, 1 part orange mineral.
- 102.—Naples yellow: 160 parts white-lead, 9 parts golden ochre, 1 part orange chrome.
- 103.—Orange: orange chrome yellow.
- 104.—Orange red: deep orange chrome yellow.
- 105.—Old gold: 10 parts white-lead, 10 parts golden ochre, 1 part raw umber.
- 106.—Olive ochre: 7 parts yellow ochre, 1 part raw umber.
- 107.—Orange tint: 1 part white-lead, 1 part orange chrome.
- 108.—Primrose: medium chrome yellow white, q.s.
- 109.—Pale orange: 6 parts white-lead, 1 part medium chrome yellow.
- 110.—Rich yellow: 6 parts white-lead, 1 part medium chrome yellow.
- 111.—Roman ochre: 15 parts yellow ochre, 1 part burnt umber.
- 112.—Straw yellow: 50 to 80 parts white-lead or zinc-white, 1 part medium chrome yellow.
- 113.—Stone buff: 1 part white-lead, 1 part Oxford ochre.
- 114.—Sulphur yellow: 1 part white-lead, 1 part lemon chrome, with a trace of Berlin blue.
- 115.—Transparent yellow: yellow lake or else 8 parts zinc-white, 1 part yellow lake.
- 116.—Transparent buff: 3 parts zinc-white, 1 part raw sienna.
- 117.—Topaz: 4 parts white-lead, 1 part yellow lake.
- 118.—Yellow leaden colour: 20 parts white-lead, 2 parts golden ochre, 1 part raw umber.
- 119.—Yellow flesh tint: 80 parts white-lead, 1 part light cadmium yellow.
- 120.—Ash ground or oak: 480 parts white-lead, 4 parts yellow ochre, 1 part raw umber.
- 121.—Acorn yellow: 1 part white-lead, 1 part raw sienna.
- 122.—Carriage-body yellow: 1 part medium chrome yellow, 1 part yellow ochre.
- 123.—Jonquil yellow: 6 parts white-lead, 1 part chrome yellow, deep.

GREEN COLOURS AND THEIR ALLIED HUES.

- 124.—Apple green: 5 parts mineral green, 1 part chrome yellow, medium.
- 125.—Apple green: 12 parts white-lead, 12 parts mineral green, 1 part chrome yellow, deep.
- 126.—Apple green, very light: 20 parts chrome yellow, 1 part Berlin blue.
- 127.—Bronze green: 6 parts medium chrome

- yellow, 2 parts burnt umber, 1 part lamp-black.
- 128.—Bremen green: 15 parts white-lead, 1 part chrome yellow, deep; 1 part Berlin blue, 1 part lampblack.
- 129.—Bottle green: 5 parts medium chrome green, 1 part ivory black.
- 130.—Brilliant green: 1 part white-lead, 1 part Paris green.
- 131.—Brilliant green: 4 parts Paris green, 1 part medium chrome green.
- 132.—Blue green: 7 parts white-lead, 1 part deep chrome green, 1 part cobalt blue.
- 133.—Brunswick-green paint: 14 parts barytes, 3½ parts Paris white, 28 parts Brunswick green, 4½ parts boiled oil.
- 134.—Bronze-green paint: 28 parts barytes, 7 parts middle chrome yellow, 14 parts middle chrome green, 1½ part vegetable black, 7 parts raw linseed oil.
- 135.—Bronze green, light: 1 part medium chrome gold, 2 parts raw umber.
- 136.—Citrine green: 160 parts white-lead, 3 parts medium chrome yellow, 1 part ivory-black.
- 137.—Chrome green, light: 7 parts lemon chrome yellow, 1 part Prussian blue.
- 138.—Chrome green, medium: 1 part lemon chrome yellow, 1 part Prussian blue.
- 139.—Chrome green, dark: 7 parts lemon chrome yellow, 6 parts Prussian blue.
- 140.—Citrine, light: 5 parts medium chrome green, 1 part medium chrome yellow.
- 141.—Citrine, middle: 5 parts medium chrome yellow, 1 part raw umber.
- 142.—Citrine, dark: 4 parts medium chrome yellow, 2 parts raw umber.
- 143.—Citrine: 240 parts white-lead, 7 parts medium chrome yellow, 2 parts lampblack.
- 144.—Citrine, Egyptian green: 80 parts white-lead, 2 parts light chrome green, 1 part raw umber.
- 145.—Emerald green tint: 8 parts white-lead, 1 part medium emerald green.
- 146.—Foliage green: 4 parts lemon chrome, 1 part ivory black.
- 147.—Foliage green: 4 parts medium chrome yellow, 1 part ivory black.
- 148.—Foliage green: 1 part lemon chrome, 1 part medium chrome yellow, 1 part ivory black.
- 149.—Grass green: 6 parts chrome yellow, medium; 1 part Berlin blue.
- 150.—Grass green (lighter): 40 parts chrome yellow, 40 parts white-lead, 1 part Berlin blue.
- 151.—Grey-green tint: 3 parts zinc-white, 1 part terra-verte.
- 152.—Luminous green tint: 1 part white-lead, 1 part deep chrome green, 1 part light emerald green.
- 153.—Light green tint: 16 parts whiting, 1 part Brunswick green (distemper colour).
- 154.—Myrtle green: 15 parts white-lead, 8 parts medium chrome green, 1 part lampblack.
- 155.—Oriental green: 1 part lemon chrome, 1 part raw umber.
- 156.—Olive green: 5 parts golden ochre, 1 part ivory black.
- 157.—Olivette green: 5 parts lemon chrome, 2 parts burnt umber, 1 part lampblack.
- 158.—Olivette green: 1 part medium chrome yellow, 2 parts golden ochre, 3 parts raw umber, 1 part ivory black.
- 159.—Olivette green: 24 parts white-lead, 3 parts golden ochre, 1 part ivory black.
- 160.—Pea-green: 48 parts white-lead, 1 part chrome green.
- 161.—Prismatic green: 30 parts Paris blue, 5 parts white-lead, 1 part lemon chrome.
- 162.—Pale green: 32 parts whiting, 1 part magnesium green.
- 163.—Pale green: 32 parts whiting, 1 part zinc-green.
- 164.—Sage green (light): 60 parts white-lead, 2 parts light chrome green, 1 part raw umber.
- 165.—Sage green (dark): 120 parts white-lead, 4 parts light chrome green, 1 part ivory black.
- 166.—Sea-green tint: 30 parts white lead, 1 part deep chrome green.
- 167.—Sea-green (deeper): 3 parts zinc-white, 2 parts verdigris, 1 part raw sienna.
- 168.—Stone green tint: 12 parts white-lead, 1 part medium chrome green, 1 part raw umber.
- 169.—Salmon green tint: 4 parts zinc-white, 1 part medium milari green.

- 170.—Transparent aquamarine green, 8 parts zinc-white, 1 part ultramarine green.
- 171.—Water-green tint: 20 parts white-lead, 9 parts raw sienna, 1 part deep chrome green.
- 172.—Olive green: 2 parts yellow ochre, 1 part lampblack.
- 173.—Sea green (light): 130 parts white-lead, 13 parts chrome yellow, 1 part Berlin blue.
- 174.—Saxon green (paint): 16 parts barytes, 4 parts Paris white, 32 parts Saxon green, 5½ parts raw oil, driers q.s.
- 175.—Saxon green (paint): 30 parts barytes, 4 parts Paris white, 16 parts Saxon green, 5½ parts raw oil, driers q.s.

BLUES AND THEIR ALLIED HUES.

- 176.—Azure blue: 140 parts white-lead, 1 part Berlin blue.
- 177.—Azure tint: 40 parts white-lead, 1 part ultramarine.
- 178.—Bluish white: 110 parts white-lead or zinc white, 1 part indigo.
- 179.—Blue grass tint: 12 parts zinc-white, 1 part cobalt blue.
- 180.—Blue-grey tint: 60 parts white-lead, 4 parts Prussian blue, 1 part lampblack.
- 181.—Blue-water tint: 32 parts white lead, 1 part Prussian blue, 1 part burnt umber.

- 183.—Blue-mist tint: 12 parts white-lead, 3 parts ultramarine blue, 1 part golden ochre (oil only).
- 184.—Blue-black: 32 parts lampblack, 1 part Prussian blue.
- 185.—Blue-black (for oil or water): 16 parts ivory black, 16 parts Frankfort black, 1 part soluble Prussian blue.
- 186.—Cornflower blue: 55 parts Berlin blue, 1 part white-lead.
- 187.—Chromatic-blue tint: 1 part zinc-white, 1 part cobalt blue.
- 188.—Deep blue: ultramarine blue.
- 189.—Deep-blue tint: 20 parts white-lead, 1 part Antwerp blue.
- 190.—Celestial blue (paint): 83 parts celestial blue, 31 parts Paris white, 17 parts raw oil.
- 191.—Celestial blue (paint): 16 parts celestial blue, 30 parts barytes, 4 parts Paris white, 5½ parts raw linseed oil.
- 192.—Fog-blue tint: 12 parts zinc-white, 1 part cobalt blue.
- 193.—Fog-blue tint: 30 parts white-lead, 9 parts ultramarine blue, 1 part burnt sienna.
- 194.—French-blue tint: 2 parts cobalt blue, 1 part zinc-white.
- 195.—Intense-blue tint: 50 parts white-lead, 1 part Paris blue.
- 196.—Light blue: cerulean blue.
- 197.—Mountain-blue tint: 4 parts white lead, 3 parts cobalt blue, 2 parts rose middle, 1 part ivory black.
- 198.—New blue tint: 7 parts white-lead, 1 part ultramarine.
- 199.—Opaque-blue tint: 1 part white-lead, 1 part ultramarine.
- 200.—Ochre-blue tint: 32 parts white-lead, 2 parts ultramarine blue, 1 part Oxford ochre.
- 201.—Oriental-blue tint: 20 parts white-lead, 2 parts Prussian blue, 1 part lemon-chrome yellow.
- 202.—Pure blue tint: 12 parts zinc-white, 1 part cobalt blue.
- 203.—Pale blue (distemper): 32 parts whiting, 1 part soluble blue.
- 204.—Pale blue (distemper): 24 parts whiting, 1 part ultramarine blue.
- 205.—Pale blue (distemper): 32 parts whiting, 1 part blue verditer.
- 206.—Royal blue tint: 8 parts white-lead, 4 parts ultramarine, 1 part rose-pink.
- 207.—Rock-blue tint: 32 parts white-lead, 4 parts raw umber, 1 part Prussian blue.
- 208.—Sky-blue tint: 120 parts white-lead, 1 part Prussian blue.
- 209.—Solid-blue tint: 6 parts white-lead, 1 part Antwerp blue.
- 210.—Sapphire-blue tint: 2 parts zinc-white, 1 part Chinese blue.
- 211.—Stone-blue tint: 48 parts white-lead, 2 parts Prussian blue, 1 part raw umber.
- 212.—Sea-blue tint: 6 parts zinc-white, 1 part Prussian blue, 2 parts raw sienna.
- 213.—Sombre-blue tint: 10 parts white-lead, 1 part Prussian blue, 1 part ivory black.
- 214.—Turquoise-blue tint: 12 parts white-lead, 2 parts cobalt blue, 1 part medium chrome pink.

- 215.—Transparent-blue tint: 16 parts zinc-white, 12 parts kaolin, 4 parts pulverised soapstone, 1 part cobalt blue. Distemper: nondescript colours and hues.
- 216.—Asiatic-bronze tint: 12 parts white-lead, 2 parts raw umber, 1 part medium chrome yellow.
- 217.—Ash-grey tint: 60 parts white-lead, 5 parts vermilion, 1 part deep chrome green.
- 217A.—Auburn tint: 20 parts white-lead, 3 parts golden ochre, 1 part burnt sienna.
- 218.—Amber brown: 8 parts burnt umber, 5 parts medium chrome, 4 parts burnt sienna.
- 219.—Bistre-brown tint: 6 parts white-lead, 5 parts burnt umber, 1 part lampblack.
- 220.—Brown stone: 12 parts burnt umber, 1 part golden ochre, 1 part burnt sienna.
- 221.—Bone-brown tint: 4 parts zinc-white, 1 part bone brown.
- 222.—Bright grey: 60 parts whiting, 32 parts zinc-white, 1 part ivory black. (Distemper.)
- 223.—Chalk white: 4 parts white-lead, 1 part zinc-white.
- 224.—Cold white: 400 parts white-lead, 1 part ivory black.
- 225.—Clay white: 1 part kaolin (China clay), 1 part zinc-white.
- 226.—Crystal white: 6 parts plaster of Paris, 1 part powdered alum, size q.s. (Distemper.)
- 227.—Chinese white: 3 parts zinc-white, 1 part whiting, 1 part white-lead.
- 228.—Calcium white: 3 parts calcic hydrate (slaked lime), 1 part water.
- 229.—Ammonial white: 17 parts white-lead, 3 parts baryta.
- 229A.—Chestnut brown: 1 part Prussian red, $\frac{1}{10}$ part lampblack, $\frac{1}{10}$ part vermilion.
- 230.—Chocolate tint: 10 parts white-lead, 1 part burnt umber.
- 231.—Chocolate paint: 56 parts purple oxide of iron, 28 parts barytes, 28 parts Paris white, 1 part vegetable black, boiled oil q.s.
- 232.—Cinnamon tint: 6 parts white-lead, 2 parts burnt sienna, 1 part golden ochre.
- 233.—Coffee brown: 5 parts burnt umber, 2 parts yellow ochre, 1 part burnt sienna.
- 234.—Cocoon brown: 1 part white-lead, 2 parts burnt umber.
- 235.—Calcinene brown (distemper): 32 parts Paris white, 1 part Spanish brown.
- 236.—Cold-grey tint: 400 parts white-lead, 8 parts lamp-black, 1 part Prussian blue.
- 237.—Deep drab tint: 32 parts white-lead, 1 part burnt umber.
- 238.—Deep stone tint: 16 parts white-lead, 1 part raw umber.
- 239.—Dark brown: Burnt umber alone.
- 240.—Deep fawn tint: 6 parts white-lead, 3 parts burnt umber, 1 part yellow ochre.
- 241.—Deep French-grey tint: 120 parts white-lead, 2 parts lamp-black, 1 part orange chrome.
- 242.—Dark grey tint: 240 parts white-lead, 4 parts ultramarine blue, 1 part ivory black.
- 242A.—Egyptian white: 200 parts white-lead, 1 part ultramarine green.
- 243.—Everlasting white: 2 parts zinc-white, 1 part baryta.
- 244.—Fireproof white (distemper): 4 parts baryta, 3 parts whiting, 2 parts alum (powdered), 1 part rock-salt.
- 245.—Fawn tint: 30 parts white-lead, 3 parts burnt umber, 2 parts yellow ochre.
- 246.—Fawn buff tint: 10 parts white-lead, 1 part burnt umber, 1 part golden ochre.
- 247.—Foliage brown: 1 part vandyke brown, 1 part orange chrome.
- 248.—Golden brown tint: 16 parts white-lead, 3 parts yellow ochre, 1 part burnt sienna.
- 249.—Green-bay drab tint: 240 parts white-lead, 9 parts raw umber, 1 part Prussian blue.
- 250.—Grey granite ground: 48 parts white-lead, 1 part lampblack.
- 251.—Grey, pale: 80 parts whiting, 1 part ivory black.
- 252.—Grey, warm: 160 parts whiting, 4 parts ivory black, 1 part yellow (distemper).
- 253.—Grey, silver: 320 parts white-lead, 4 parts lampblack, 1 part yellow.
- 254.—Grey, warm: 160 parts white-lead, 4 parts ivory black, 1 part golden ochre, 1 part Venetian red.
- 255.—Grey, olive: 160 parts white-lead, 3 parts lampblack, 1 part chrome green.
- 256.—Grey lustre: 12 parts white-lead, 3 parts zinc-white, 1 part blacklead (plumbago).
- 257.—Grey lustre tint: 48 parts white-lead, 1 part blacklead.
- 258.—Grey silver: 1 part white-lead or zinc-white, indigo sufficient to produce shade desired.
- 259.—Golden yellow: 2 parts of white, 1 part chrome yellow.
- 260.—Grey: 120 parts zinc-white, 24 parts white-lead, 48 parts whiting, 1 part bone black, 8 parts yellow ochre.
- 261.—Hamburg white: 2 parts barytes, 1 part white-lead.
- 262.—Hazel yellow: 60 parts white-lead, 5 parts yellow ochre, 1 part red ochre, 1 part lamp-black.
- 263.—Hazy brown tint: 9 parts white-lead, 4 parts ultramarine blue, 2 parts burnt sienna.
- 264.—Indian brown: 1 part Indian red, 1 part yellow ochre, 1 part lampblack.
- 265.—Jonquil yellow: 6 parts white-lead, 1 part chrome yellow, deep.
- 266.—Jet black: 3 parts ivory black, 1 part burnt umber, 1 part Prussian blue.
- 267.—Light drab tint: 96 parts white-lead, 1 part burnt umber.
- 268.—Light stone tint: 96 parts white-lead, 1 part raw umber.
- 269.—Light French grey tint: 480 parts white-lead, 2 parts ivory black, 1 part orange chrome.
- 270.—Lead colour: 80 parts white-lead, 1 part lampblack.
- 271.—Medium drab tint: 60 parts white-lead, 1 part burnt umber.
- 272.—Medium stone tint: 48 parts white-lead, 1 part raw umber.
- 273.—Mahogany tint: 48 parts white-lead, 3 parts Venetian red, 1 part medium chrome yellow.
- 274.—Mouse colour or tint: 240 parts of white-lead, 9 parts raw umber, 1 part Prussian blue.
- 275.—Medium French grey tint: 240 parts white-lead, 2 parts ivory black, 1 part orange chrome.
- 276.—Lead colour paint: 84 parts zinc-white, 260 parts barytes, 14 parts Paris white, 7 parts celestial blue, 2 parts vegetable oil, 3 parts purple oil, linseed oil q.s.
- 277.—Lead colour paint: 48 parts zinc-white, 350 parts barytes, 77 parts Paris white, $3\frac{1}{2}$ parts celestial blue, 2 parts vegetable black, 3 parts purple oxide, 57 parts linseed oil.
- 278.—Lead-colour paint, cheap:—168lb. white-lead, 224lb. barytes, $4\frac{1}{2}$ oz. vegetable black, $2\frac{1}{2}$ gallons boiled oil, $1\frac{1}{2}$ gallon varnish foots, 6oz. patent driers.
- 279.—Lead-colour paint: 49 parts white-lead, 368 parts barytes, 49 parts pure white, $\frac{3}{4}$ oz. lampblack, 4oz. celestial blue, $1\frac{1}{2}$ parts varnish foots, 47 parts (by weight) boiled oil.
- 280.—Opaque white: White-lead alone.
- 281.—Orange brown: 3 parts burnt sienna, 2 parts orange chrome.
- 282.—Olive black: 16 parts Frankfort black, 1 part lampblack.
- 283.—Opal grey tint: 30 parts zinc white, 2 parts cobalt blue, 1 part burnt sienna.
- 284.—Pure white: 1 part white-lead, 2 parts zinc-white.
- 285.—Pearl white: 500 parts white-lead, 1 part cobalt blue, 1 part Indian red.
- 286.—Pale white: 500 parts white-lead, 1 part ultramarine blue.
- 287.—Porcelain white: 1 part whiting, 2 parts zinc-white (oil or distemper).
- 288.—Permanent white: "Floated" barytes—i.e., sulphate of barium precipitated.
- 289.—Poverty brown tint: 8 parts zinc-white, 4 parts white-lead, 1 part Spanish brown.
- 290.—Pale brown tint: 72 parts whiting, 1 part burnt umber (distemper).
- 291.—Purple black: 4 parts lampblack, 1 part rose-pink.
- 292.—Pure grey tint: 240 parts white-lead, 1 part ivory black.
- 293.—Pearl grey tint: 40 parts white-lead, 5 parts vermilion, 1 part deep chrome green.
- 293A.—Purple brown tint: 20 parts white-lead, 4 parts Indian red, 1 part ultramarine blue, 1 part lampblack.
- 294.—Quaker drab: 5 parts white-lead, 1 part raw umber, 1 part yellow ochre.
- 295.—Russian grey tint:—48 parts white-lead, 2 parts burnt umber, 1 part ivory black.
- 296.—Silver white: 1 part white-lead, 1 zinc-white.
- 297.—Snuff-brown tint: 4 parts white-lead, 1 part orange chrome, 1 part burnt umber.
- 298.—Stone drab tint: 8 parts white-lead, 1 part raw umber.
- 299.—Seal brown: 4 parts burnt umber, 1 part golden ochre.
- 300.—Snuff brown:—1 part burnt umber, 1 part golden ochre.
- 301.—Siberian brown tint: 10 parts white-lead, 9 parts raw umber, 1 part Oxford ochre.
- 302.—Stone brown tint: 4 parts white-lead, 3 parts raw umber.
- 303.—Tan tint: 30 parts white-lead, 5 parts burnt umber, 3 parts burnt sienna, 2 parts golden ochre.
- 304.—Thrush brown tint: 12 parts white-lead, 3 parts burnt umber, 1 part yellow ochre.
- 305.—Transparent brown tint: 1 part zinc-white, 1 part brown madder.
- 306.—Verdant grey tint: 2 parts zinc-white, 1 part terra-verte.
- 307.—Walnut ground, light (for graining on): 480 parts white-lead, 18 parts golden ochre, 5 parts Venetian red, 1 part lampblack.
- 308.—Walnut ground, dark (for graining on): 80 parts white-lead, 1 part burnt umber, 2 parts yellow ochre.
- 309.—Walnut stain (for wood), reddish: 8 parts burnt umber, 1 part burnt Sienna. (Vehicle to mix them with is stale beer, turpentine, or methylated spirit.)
- 310.—Walnut stain, yellowish (for wood): 4 parts burnt umber, 1 part raw sienna.
- 311.—Transparent brown stain (for wood): 1oz. Cassel earth, $1\frac{1}{2}$ oz. hot water, 1oz. liquid ammonia, make a liquid stain for wood.
- 312.—Italian brown: 2 parts Vandyke brown, 1 part raw sienna. (Water, spirit, or stale beer is the vehicle in which these solids are ground up, and used to stain wood to represent walnut.) H. C. S.

CHIPS.

The Stickphast Paste Proprietary, of Sugar Loaf-court, Leadenhall-street, E.C., have sent us a glorification in leather and silver, intended for office or library, to hold safely and ornamentally a bottle of their admirable speciality, which sticks closer than a brother—architect!

At Blackburn County-court, on Friday, Judge Coventry and a jury heard an action brought by John Larkin, of Baxenden, to recover £125 damages from the Nicholl Chemical Company. Plaintiff, a bricksetter's labourer, was engaged in an extension on defendants' works, when a scaffold collapsed through alleged faulty construction. Two men were killed, and plaintiff broke his leg, ankle, and seven ribs, and sustained other severe injuries. The jury found for plaintiff, and assessed the damages at £100.

Colonel Fishwick, president of the Lancashire and Cheshire Antiquarian Society and of the Record Society of Lancashire and Cheshire, is making an effort to form a Lancashire Register Society, for the purpose of printing and preserving all the old registers of the old parish churches in the County Palatine.

Four stained-glass windows have been fixed at Newport-road Church, Cardiff. The three windows in the chancel of the church each comprise three lights, and tracery of a decorative character. Each window comprises one subject. The grouping is carried through the mullions of the lights. The centre window has the subject of "Our Lord Blessing Little Children." The mothers and children are depicted in a very graceful attitude, with foliage and landscape background. The tracery has a representation of "The Sower Sowing the Good Seed." The sinister window, of equal proportions, has for its subject "The Feeding of the Multitude." The tracery contains "The Good Shepherd and Angels" in attitude of adoration. The dexter window, of two lights, also has one subject, being that of "Christ Healing the Sick, the Halt, the Lame, and the Blind." The centre light has for its subject the figure of Christ, with a female figure and child prostrate at His feet; whilst on either side are suppliants for relief from misery and pain. Over the entrance of the church is a very large rose or wheel window, which has been treated with figures in an admirable manner, to avoid an Antipodean effect. In the centre is the subject of "Charity or Love," and in eight openings are the "Fruits of the Spirit," represented by angelic figures. The interstices, or spaces between, are designed and painted by a variety of geometrical patterns. Both as to drawing and colour, the windows make a very handsome and effective addition to the interior of the edifice. The whole of the work has been designed and executed by Messrs. Swaine, Bourne, and Son, of King Edward's-road, Birmingham, under the supervision of the architects, Messrs. Ingall and Son, Temple-row, Birmingham.

OBITUARY.

SIR HENRY DOULTON died on Wednesday evening at South Kensington. He was born in 1820, and was the senior partner of the well-known firm of Doulton and Co., of Lambeth, which has done so much for artistic pottery and sanitary ware. Sir Henry Doulton was knighted in 1887. His death, which was due to a heart affection, was quite unexpected, the malady having made its presence felt only a few days since.

MR. J. B. BURGESS, R.A., the well-known painter of Spanish landscapes, gipsies, and bull-fighters, died on Friday at his house in the Finchley-road, after a long illness, at the age of 67. His father, William Burgess, was landscape painter to George IV., and the son was brought up to be an artist from an early age, receiving his education in the Academy schools. He early conceived an admiration for the work of John Phillip, and therefore chose Spain for the theatre of his operations, and remained faithful to that land throughout his career. His portfolios contain hundreds of sketches and studies, made on the spot in the course of many visits, of scenes, places, and single figures in Burgos and Madrid, in Seville and Salamanca. These were the foundations of the pictures which have been for the last 30 years or more familiar objects at each Academy exhibition. He was elected an Associate Academician 20 years ago, becoming a full member a dozen years later. He was represented in this year's Academy exhibition by "A Mothers' Meeting in the Country"—a scene of contemporary English working-class life, prosaically treated—which was hung in Gallery III., and last year, in the same gallery, by "Pensioned Off"—a pathetic picture of a melancholy-looking old violinist, who leans on his boy's arm as he hears judgment pronounced in the presence of all the choir by the stern vicar, who is seated in the sacristy. The other work of 1896 was "The Widower," also an aged military-looking man, seated with his three daughters in a church—both Spanish *genre* subjects.

MR. EDWIN THOMAS, M.Inst.C.E., of High-bury New Park, N., died at Bournemouth on Friday, aged 70. He was the son of Mr. James Thomas, for many years the engineer to the Birmingham Canal Navigation. Mr. Edwin Thomas was for 44 years engineer and general manager to the North Metropolitan Railway and Canal Company (Regent's Canal). During this time he effected several very large and important works, among which may be mentioned the enlargement of the Limehouse basin and the building of a new ship entrance thereto, in the year 1868, at the cost of a quarter of a million.

CHIPS.

General W. W. Duffield has resigned as superintendent of the United States Coast and Geodetic Survey, and will be succeeded by Mr. Henry S. Pritchett, Professor of Physics and Astronomy in Washington University, St. Louis, Mo.

The ceremony of opening a new English Presbyterian church at Rhosyllen, near Wrexham, took place on Sunday. The structure has cost about £1,200, and has seating accommodation for about 100 persons.

Messrs. Sotheby, Wilkinson, and Hodge concluded on Saturday the two days' sale of a portion of the library of the late Mr. George T. Robinson, F.S.A., the well-known architect and decorator, the 563 lots showing a total of £1,365 3s.

Official reports just published at Sydney describe the success which has attended the system of irrigation by artesian wells in the Bourke district of New South Wales, and show that it has already given a great stimulus to agricultural production. The water supplied from the artesian borings exists, apparently, in unlimited quantities, and is obtainable over 62,000 square miles of the interior of New South Wales.

The monthly report of the Labour Department states that, apart from the trades affected directly or indirectly by the engineering dispute, the state of employment shows no falling off. The building trades still continue on the whole well employed. The percentage of unemployed in unions making returns was 1.7, compared with 1.4 in September and 0.9 per cent. in October, 1896. The furnishing trades, though still well employed, are scarcely so active. The percentage of unemployed union members at the end of October was 2.2, compared with 1.4 in September and 1.7 per cent. at the end of October last year.

Building Intelligence.

ASTON.—The newly-erected additions to the Aston Workhouse were formally opened on Tuesday. They consist of a block of buildings providing accommodation for aged married couples, and another building for male vagrants, containing sufficient room to enable the guardians to detain the professional tramps two nights, instead of only one as is at present the case. Several other minor alterations and improvements have been carried out at a total cost of £5,803. Mr. W. S. Seamark was the contractor, and Mr. C. Whitwell the architect. The aged people's quarters consist of a two-story building, with accommodation for ten couples—five on each floor.

BIRMINGHAM.—St. Mary's Church, Whittall-street, is to be opened for service on Sunday next, the 21st inst., after restoration and renovation, which has literally transformed the interior from a grimy barn to a decent place of worship. The unsightly, cumbersome gallery which surrounded the octagonal nave, save at the chancel entrance, has been cleared away, all but a short section over the main entrance to the church which contains the organ. Light has thus been let into the interior such as it never knew before, and under the direction of Messrs. Bateman and Bateman, the architects, carried out by Messrs. Horton and Son, contractors, of Bristol-street, in the same city, the church has been brightened up, the style adopted being that of Italian work of the 15th century. The decorative works have been executed by Messrs. Jeffery, also of Birmingham. The heavy drooping ceiling is now a handsome dome, painted in panels in classic and conventional designs in three primary colours and graded tones. The walls are of apple-green hue to the level of the old galleries, and above that in cream colour, and the windows are framed in ornament in blue, green, and red. A band of flowing design in yellow and brown runs round the compartments of the ceiling over the aisles, and a conventional pattern is wrought in sage green on the flat portions.

EALING.—The enlargement of the extensive school buildings of St. John's parish, Ealing Dean, Middlesex, was formally opened by the vicar of the parish on Saturday last. There is increased accommodation for 200 children, making nearly a thousand in all. The entire sanitary arrangements are also being remodelled and modernised. The works have been carried out by Messrs. Foord and Sons, of Brentford, under the supervision of the architect, Mr. Robert Willey, F.R.I.B.A., of 33, New Bridge-street, E.C., and Ealing.

EDINBURGH.—Another stage in the decoration of the Catholic Apostolic Church, Broughton-street, by Mrs. Traquair, has been reached. First, the great spaces at the sides of and over the lofty chancel arch were dealt with by this lady, then the south aisle of the chancel was decorated, and now Mrs. Traquair has reached a third stage in her work by the completion of the painting of the north aisle of the choir. The subject of the first part of the work was the worship of the hierarchy of angels and saints in heaven: in the south chancel aisle was commenced the illustration of the parable of the Ten Virgins, and this story has been continued and completed in a series of decorative panels in the north aisle. Mrs. Traquair has now begun the decoration of the nave. Two broad panels running the length of the nave on each side, under the clerestory windows, have been formed, and in these there will be represented scenes in the life of Christ.

MANCHESTER.—A new concert hall is about to be erected in Oxford-street, next to the offices of the Refuge Friendly Society. The designs have been prepared by Messrs. Mangnall and Littlewoods, of Manchester. The style adopted gives a Spanish Renaissance frontage, the material to be employed being buff terracotta. The building is to be of four stories, the lower one consisting of four shops, whilst the upper one will be surmounted by a centre gable flanked by towers with octagon turrets. The large hall is to be capable of seating 1,500 persons, in the proportion of 1,000 in the body, and half that number in the galleries. The body of the hall can be divided, if necessary, into three parts, and there will be a separate entrance to each class of seats.

NANTWICH.—A new cocoa house, in Pillory-street, built at a cost of about £2,000, was opened

on Wednesday week. It contains on the ground floor refreshment-room and bar (26ft. by 21ft.), commercial-room (18ft. by 21ft.), entrance-hall, staircase, and gentleman's lavatories; kitchen (15ft. by 15ft.), placed behind the bar, pantries, scullery, and the usual out-offices. There is a separate entrance for the manager at the side, and also a separate staircase. On the first floor there are a billiard-room (18ft. by 21ft.), committee-room (21ft. by 15ft.), ladies' room (21ft. by 18ft.); the two latter rooms are divided by a folding partition. The manager's sitting-room and bedroom, and ladies' lavatory, storeroom, &c., are also on this floor. On the second floor there are five bedrooms, bathroom, w.c., &c. The internal doors and fittings are pitch-pine. Externally the style is Modern Renaissance, the principal feature being the bay windows in the centre of the two main gables, with two smaller gables between. Ruabon bricks have been used for the exterior, with Grinshill stone dressings to doors and windows. Mr. W. Martin, of Haslington, near Crewe, was the builder, and the architect is Mr. C. E. Davenport, of Nantwich, who obtained the work in competition. The plumbing and decorating and gas-fitting work has been carried out by Mr. Jos. Barnett, of High-street, Nantwich.

CHIPS.

Colonel A. J. Hepper, R.E., an Inspector of the Local Government Board, attended on Friday at the offices of the Rawmarsh Urban Council with reference to a loan of £4,000 for the purchase of the Rose Hill Estate for the purposes of a public park.

About twelve months since the members of the Reformed Episcopal Church at Exmouth purchased the old Wesleyan chapel in that town, and altered it to suit their requirements. An aisle, affording accommodation for 100 persons, has now been added, and this was opened on Friday.

A special meeting of the Edinburgh and Leith Gas Commission was held on Friday for the purpose of dealing with the question of the purchase of a new site for the gasworks. Acting on the report of a committee and the engineer, it was decided to promote a Bill next session to remove the works to a site of 106½ acres to the west of Granton, and with easy access to the North British and Caledonian lines of railway. The purchase price is £124,000, equal to £1,167 per acre.

At the Public Offices, Egremont, on Friday, an inquiry was held before Major-General Crozier, R.E., an inspector of the Local Government Board, into an application by the Wallasey District Council for a provisional order under section 303, Public Health Act, 1875, to alter or amend various Acts of Parliament applicable to the Wallasey Urban District by the granting of £40,000 additional borrowing powers for gasworks purposes; also for sanction to borrow the sum of £5,000 for the purposes of the gas undertaking under the unexhausted borrowing powers conferred by the Wallasey Order, 1896. The plans were explained by Mr. J. H. Crowther, the gas engineer.

The death is announced of Mr. R. E. Nelson, superintending engineer, South-Western Circle, Burma, at the age of 47 years. Mr. Nelson entered the Public Works Department of India in 1869, and became acting superintending engineer at Mandalay in 1894. His services were in the Central Provinces, Assam and Burma. Since December last he had been in charge of the South-Western Circle with headquarters at Rangoon.

A fresh development has taken place in the controversy as to the rebuilding of the church tower at Liskeard. The borough surveyor of that town, Mr. T. McMeikan, has reported it to the corporation as a dangerous structure, and accordingly the peal of bells has been removed. On Sunday the Corporation attended the church in state, when the west entrance was not used, and a barricade was placed across the west end of the north aisle.

At St. Anne's-on-the-Sea on Saturday afternoon the formal opening and presentation of a new convalescent home for Manchester children was performed by the donor, Sir William Agnew, Bart. The home, which has been constructed from plans prepared by Mr. Alfred Steinhil, architect, of Manchester, is situated about a mile from St. Anne's railway station on the high road to Blackpool. It is provided with ground for future extensions, and possesses an uninterrupted view of the sea, although standing some 200ft. from the coast-line. The home has accommodation for 25 patients, as well as for matron, two nurses, and two domestic servants.

The Burgh Schools, St. Andrew's, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

SCULPTURE FROM THE DRAPERS' HALL.

THE Drapers' Company possess some notable sculpture in the large reception-rooms of their Grand Hall in Throgmorton-street, City. On the staircase is located Belt's "Hypatia," a dramatic figure, boldly treated, as will be seen by our illustration. Thorwaldsen, the famous Danish sculptor, is represented by his group of "The Shepherd Boy and his Dog." It stands in front of a silvered-glass panel, thus insuring a double view of the sculpture, as photographed specially for us by Mr. Sandell. The "Venus," which completes our plate, calls for no special remark. We published views of the Drapers' Hall Buildings on July 10 and 24, 1896, the Court-room appearing on December 11 last.

QUEEN VICTORIA JUBILEE BOARD SCHOOLS, DEWSBURY.

SEE description and plans on p. 718.

PAIR OF VILLAS AT SUTTON.

THESE houses are about to be erected at Sutton, from the designs of Mr. C. Bridgen. The ground-floor is to be faced in red bricks, the upper story being treated in imitation half-timber work. The roofing is to be of Broseley tiles, and the external woodwork is to be painted a light shade of green.

HOUSE AT BEESTON HILL, LEEDS.

HARD-PRESSED facing-bricks of the finest quality have been determined on for the walling of this house, Ferndale stone being employed for the mullions and dressings. The oak half-timbering to be dressed with Stockholm tar. Broseley tiles are used for the roofs. Part of the house formed a portion of an earlier building, and the dining-room is tastefully managed with a big circular bay. The entrance to it through the columned recess is ingeniously contrived. Messrs. Hall, Cooper, and Davis are the architects.

ST. MAGNUS, BESSINGBY.

THE present church takes the place of a last-century brick building which had become ruinous. The church is faced externally with Whitby stone, with tiled roofs, and a red stone is used for the internal work. The ceilings are decorated in colour, and the fittings are in oak. The contractor was Mr. J. Rennard, of Bridlington. The church is from the designs of Mr. Temple Moore, whose drawings now illustrated were on view at the Royal Academy this year.

ROYAL HOTEL, WEYMOUTH.

THIS building, adjoining the Royal Arcade on the Esplanade, is built of Bridgewater red bricks

and Portland and Corsham Down stone dressings. The hotel is fitted with every modern appliance and convenience, and electric light generated upon the premises. The architect is Mr. C. Orlando Law, M.S.A., and the contractors are Messrs. Creaton and Co. The drawing was exhibited at the Royal Academy.

FURNITURE FOR THE HALL.

THE Table in the upper part of the page of this sheet of sketches is of capital form. The top is brought over the ends to an unusual length, and, being thin, is strengthened by means of battens on the underside. The bulbous legs, though abhorred by some, nevertheless, in this case, raise the piece out of the region of the commonplace, while the simple form of stretcher adds much to its character. The two Chairs are widely different in style, though both possess front feet of similar pattern, the one with the high back, formed of turned posts and four shaped splads, has a rush-bottom seat, and is much lighter in character than the other, which has leather seat and back pinned to framing with double rows of nails. The Table last on the sheet is a very much more sturdy article, with heavy framing and deeply panelled drawers and rails. Like the other pieces herewith portrayed it would form an excellent adjunct to the hall.

The reservoir constructed near Hawarden for the Hawarden Waterworks Company is, with the exception of the coping, completed. It has a water capacity of 76,800 cu. ft., equal to 479,000 gallons. Mr. W. D. Simmons, of Wrexham, has been the contractor.

A Local Government Board inquiry was held on Friday at Cheltenham, by Lieut.-Colonel A. C. Smith, R.E., relative to the application of the town council for sanction to borrow £13,385 for the purposes of extending the electric light for street lighting and private customers.

The Lord Chancellor has consented to open, on the 24th inst., the new public library at the corner of Lordship-lane and Woodwarde-road, Dulwich, erected by Mr. Passmore Edwards as a memorial of Edward Alleyn, founder of the College of God's Gift. The foundation-stone of the library was laid by Sir Henry Irving. The building, which was designed by Messrs. Charles Barry and Son, was illustrated and described in our issue of Oct. 23, 1896. Messrs. James Gough and Co., of Hendon, were the contractors, and Mr. J. Birt was the clerk of works. The cost has been about £6,500. The library is of red brick with Bath stone dressings, and moulded brick stays and cornices. The floors are fireproof, on the system of Messrs. Mark Fawcett and Co., of Queen Anne's-gate, Westminster.

A popular lecture was delivered in the Great Hall of the Merchant Venturers' Technical College, Bristol, on Wednesday evening, by Mr. Whitworth Wallis, the director of the City of Birmingham Art Gallery, who took as his subject "The Art of Sir John E. Millais, P.R.A."

Mr. H. Hayter, the arbitrator in the disputed accounts between the Manchester Corporation and Messrs. Watson and Wilson, the contractors for 17 miles of the Thirlmere watercourse, between Preston and Chorley, has now nearly completed the hearing of the case, and only a few days' sittings will be needed. On Friday, after hearing evidence from Mr. Henry Nicholson, the pipe inspector, the arbitrator adjourned the further proceedings for a month. It is not at all likely that his award will be made until the New Year.

The rector and churchwardens of Oldbury-on-Severn make the following appeal:—"The ancient church of St. Aruld, standing on the site of a Roman Camp overlooking the Severn, and whose tower served to guide mariners, has just been utterly ruined by fire following midnight sacrilege on October 31 last. To attempt to restore, as was done in 1886, under the direction of the diocesan architect, we must implore help from outside this poor agricultural parish. £1,100 has been paid by the insurance companies, but another £2,500 is required."

At the meeting on Friday of the Bristol Town Council, the members approved of the proposal with regard to the appointment of a civic estate valuer as one part of the rearrangement consequent upon the death of Mr. Josiah Thomas, the late city surveyor.

Mr. J. Newton, of the Liverpool city engineer's department, has been appointed chief clerk in the city engineer's office, Coventry. The Coventry City Council contemplate executing large public works by their own staff, which has necessitated the appointment of a chief clerk and other officials in the executive departments. Mr. Newton has been six years in the service of the Liverpool corporation.

COMPETITIONS.

BLACKFORD, SOMERSET.—Under a scheme of the Charity Commissioners it has been decided to erect new dual schools on a site given by the visitors of Hugh Sexey's Hospital, Bruton. The governors met on Saturday to receive and consider plans from five firms of architects, and those of Mr. A. J. Pictor, A.R.I.B.A., of Bruton, were selected.

NEW YORK PUBLIC LIBRARY.—The designs submitted in the final competition for the New York library are now in the hands of a jury consisting of three architects (Professor Edgar V. Seeler, of Philadelphia, and Messrs. Walter Cook, of New York, and Cass Gilbert, of St. Paul); the librarian, Dr. J. S. Billings; the secretary of the trustees, Mr. George L. Rives, and two of the trustees, Messrs. Maitland and Cadwallader.

CHIPS.

In the list of candidates reported by the scrutineers as elected Professional Associates of the Surveyors' Institution at the ballot of Oct. 27, 1897, and read to the meeting on the 8th instant, is the name of Mr. Henry James Treleavan Kibblewhite.

At the last meeting of the Dartford Rural Sanitary Authority plans by Mr. G. H. Tait were approved for the erection of chapels, boundary walls, and sexton's house, &c., at the new cemetery at Stone. The land cost about £2,000, and the estimated outlay on the building is another £3,000.

The new buildings of the grammar school at Mottram, Chester, were formally opened on Saturday. The school was founded in 1612 by Robert Garsett, refounded in 1853 by George Whitehead, and subsequently reorganised by the Charity Commissioners. The trustees have spent on the new buildings the sum of £2,311.

The ceremony of opening the New Liberal Club at Crawshawbooth was performed on Saturday. The new premises are situated in Adelaide-street, and have been erected by Mr. Ormerod Ashworth from plans drawn by Mr. A. Coates, and the total cost has been about £2,000.

A memorial bust of the late J. B. Howard, which has just been erected in the vestibule of the Theatre Royal, Glasgow, was unveiled on Friday by Sir Henry Irving. The sculptor is Mr. A. M. F. Shannon, and Mr. Howard is represented in his favourite character "Rhoderick Dhu."

Mr. J. Passmore Edwards has offered £4,000 to Acton to build a free public library and reading-room, on condition that a site is provided and the Free Public Libraries Act is adopted.

Notice has just been given of the intention on the part of seven local authorities to make application to the Board of Trade, under the Electric Lighting Acts of 1882 and 1888, for provisional orders to supply electricity for public and private purposes. These authorities are the vestry of Bermondsey, the corporations of St. Alban's and Maidenhead, the urban district councils of Willesden, Barnes, East Ham, and Aldershot.

Mr. H. H. Law, Local Government Inspector, held an inquiry at Melling on Friday regarding an application by the West Lancashire Rural District Council to borrow £3,600 for a water supply for the township of Melling. Mr. J. J. Lackland, water engineer to the St. Helen's Corporation, explained the engineering portion of the project, and the analysis of the St. Helen's water was a very favourable one as to quality.

The contractors (Messrs. Webb and Co., of Swansea) for strengthening the Town Quay at Southampton to carry new electric cranes have just begun work. The cranes are being built by Messrs. Stother and Pitt, of Bath.

The urban district council of Horsforth having decided to adopt the system of sewage purification on biological principles, as now working at Sutton, Surrey, have instructed Mr. Wm. Spinks, C.E., to prepare plans for the first installation of the project.

The parish church of St. Laurence, Ludlow, has been enriched by the addition of carving, consisting of canopied work over the groined archway of the choir screen, together with the enrichment of the shades on each side. The four original panels over the archway contained dowel-holes, which showed that they had been embellished with canopied work, and these panels have been retained, and form the back of the niches. These niches contain the figures of St. Clara, St. Mary Magdalene, St. Mary the Virgin, and St. Helena. Each figure has two angels in adoration on each side in niches. Above the niches comes a carved and pierced canopy of hanging tracery, carried by seven overailing arches. The whole is surmounted by a cresting. The work has been carried out by Mr. Lawrence Turner, who has received orders to complete the canopied work on the west and north side of the chancel.

HOUSE AT NORTHOWRAM, NEAR HALIFAX.

THE house, brewery, and stables shown upon plan are now in course of erection at Windmill Hill, Northowram, in the parish of Halifax, for Mr. James Alderson, being situated in close proximity to the well-known flagstone, and within a couple of miles of the Ringby ashlar quarries; they are built of pitch-faced outside wallstones and ashlar stone dressings. The work is being carried out under a separate contract for each trade, as is the local custom, from quantities prepared by the architect. The internal woodwork of the house is oak and pine, and the mullioned windows are to be filled with metal casements; the roofs will be covered with the best dark green Buttermere slates. In addition to open fireplaces the house will be heated by a system of low-pressure water, with American radiators, the apparatus being placed under the outside washhouse, and also utilised for heat ng the carriage-house and harness-room. The water supply has been obtained by means of an 8in. bore-hole cut through the solid rock to a depth of 90ft., into which are inserted 8in. wrought-iron screw-jointed tubes, the bottom 10ft. length only being perforated to avoid any possibility of surface pollution. A pump is placed on the ground-floor of the brewery tower, and the water pumped in a large iron tank, 60ft. above, from which it gravitates to the brewery stables and house. The water has been analysed, and proved to be absolutely pure and a perfect brewing water. A separate system of drainage is provided for the surface and foul water, the latter being passed through settling and filtering tanks with intermittent irrigation. The architect is Mr. Joseph F. Walsh.

The Surrey County Council have agreed to co-operate with the Middlesex County Council in bringing a Bill before Parliament for rebuilding New Bridge.

THE POLLUTION OF WATER SUPPLIES.

AT a meeting of the Sanitary Institute, held on Wednesday night at the Parkes Museum, Margaret-street, W., a discussion took place on "The Pollution of Water Supplies by Encampments of Hop-Pickers, Casual Workers, Tramps, &c." The chair was taken by Sir Douglas Galton.

Professor W. R. Corfield, in opening the discussion, dealt with the dangers of pollution of municipal water supplies from a general point of view. He mentioned the diseases that could be transmitted by means of water, and described the epidemics of cholera which had been directly traceable to contaminated water supplies. Passing on to discuss recent typhoid fever epidemics, he mentioned the theories which had been in the past advanced as to the causation of typhoid, and the means of its communication. He mentioned some remarkable instances of the spread of the disease by means of water pollution. Millbank Prison in 1840 was a hotbed of typhoid fever. At that time they used water baled out from the Thames; but when they took to using water from artesian wells the disease ceased, and from that time there was no typhoid except that which had been introduced from outside. That clearly showed the disease to have been communicated by the water. The disease could also be communicated by the pollution of wells and springs, as had recently been evidenced at Maidstone. He read a portion of a letter he had recently received from a medical man at Hildenborough, Kent, who wrote:—"The hop-growing district extends from a little west of this place eastwards to beyond Maidstone, and during the season of hop-picking the county is covered with encampments of people of the least sanitary class frequenting by preference the proximity of streams and rivers for the convenience of obtaining water and of washing their clothes. I hope your discussion will be the means of moving the county sanitary authorities

to inquire into the state of the water supply of the rural population, not only of this but of other districts with little or no water supply."

Miss M. A. Chreiman described the state of things obtaining in the Kentish hop-fields at the time of picking, and enforced the urgent necessity for a more effective sanitary control of the pickers. The sleeping-places of the hoppers were overcrowded to a poisonous degree. Their surroundings were such as to readily foster disease, and the streams which were used naturally became contaminated. Some of the wells which were used were in a very bad state, and she knew of one well which was only disused when the frogs and newts had made the stench of the water almost unbearable. The Farleigh reservoir, so well known in connection with the Maidstone outbreak, had not, she was informed on one occasion, been cleaned out for several years, and when it was dead babies were found in it. Such circumstances offered a most fruitful cause for the growth and spread of malarial influence.

Dr. Fosbroke, of Worcester, and Dr. Tew, medical officer of health for West Kent, having spoken, Dr. Adams, deputy-medical officer of health for Maidstone, described some of the investigations into the sources of the present typhoid epidemic. There were, no doubt, cases which called for serious reform; but there were many cases in which the hop-pickers were well looked after both as to housing, water supply, and other matters. The Rev. E. Thomas (vicar of West Farleigh), Dr. Thresh (Chelmsford), Major Flower, Dr. Porter (Stockport), and others joined in the discussion.

It was resolved at a meeting of the Edinburgh and Leith Corporation Gas Commissioners on Friday to promote a Bill in the coming session of Parliament for powers to purchase 106 acres of ground, half-a-mile west of Granton, from the Duke of Buccleuch, as the site of new central gas-works. The cost is £124,000.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

EDINBURGH ARCHITECTURAL ASSOCIATION.—The fortieth session of this Association was held on Wednesday evening by a meeting at the Royal Institution, Princes-street, Edinburgh. The president, Mr. Thomas Ross (Messrs. McGibbon and Ross), occupied the chair, and delivered his inaugural address. The programme for the session is as follows, the meetings being held on the second Wednesday evening in each month:—Dec. 15, lecture by representative of the Dundee Institute of Architecture; Jan. 12, "The Abbeys and Cathedrals of Scotland," by Mr. P. Macgregor Chalmers, of Glasgow; Feb. 9, "The Vernacular of the Wren School," by Mr. J. A. Williamson, A.R.I.B.A., President of the Edinburgh Architectural Society; March 9, "The Architectural Antiquities of Leith," by Mr. J. Campbell Irons, S.S.C.; April 6, "Notes on Fever Hospital Structure," by Bailie Pollard; May 4, annual business meeting. Saturday afternoon visits will take place on Feb. 12, March 12 and 25, April 9 and 23, and May 7, and the annual excursion is arranged for Saturday, June 4, when Alloa and Clackmannan will be visited.

GLASGOW PHILOSOPHICAL SOCIETY.—The new session of the architectural section of the Philosophical Society of Glasgow was opened on Monday evening, when Mr. Macgregor Chalmers delivered his presidential address, which dealt with the history of Glasgow Cathedral. Mr. Chalmers said that St. Mungo's Church was definitely identified at the end of the 12th century. The earliest fragment in the present cathedral was at the time of Bishop Ingeham, 1164, and although it was very small, yet lent its aid in the recognition of the structure dedicated in 1136. Bishop Jocelin added a nave, which, however, he had to stop, as the choir was burned down; but at the end of the 12th century he rebuilt the choir, and of that work the wall of the north aisle remained, and all the south aisle with its walls and vaulting. The old pillar which was retained was carved at that time also. Again the nave was started, and again it was stopped, this time for the erection of the present beautiful choir. Mr. Chalmers described the special characteristics of this work, with the sarcophagi and the effigy at the east end, and said that these, with the 15th-century slab in the churchyard, were all the Medieval memorials. The sarcophagi he compared with that in Govan, illustrating his comparison by drawings, and he expressed his opinion that the 13th-century bell tower, regarding which interesting documents were preserved, was the north-western tower which was destroyed fifty years ago, and three stones of which were still lying in the Chapter House. Mr. Chalmers was thanked for his lecture, which was illustrated by a number of limelight views.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—The members of this society opened their session on Tuesday night by a smoking concert at the Queen's Hotel, Leeds. Prior to the concert the president (Mr. George Corson) delivered the annual address. The society, he said, was formed in December, 1876, and the membership had now reached 115. Twenty years ago, as the first president, he had referred in his address to the old Coloured Cloth Hall, a building which had an industrial and a political history. After many attempts, the local authorities succeeded in securing those premises, together with the Quebec Buildings adjoining, and upon the site the Government had erected the new post-office, which, though commodious, could hardly be said to be picturesque. He was not alone in thinking that the architect, in designing the front elevation, had lost a splendid opportunity. Still, the colossal new premises presented a striking contrast to the small and abject building at the foot of Albion-street, where for some 30 years or more the postal business was carried on. The opening-out of the City-square had considerably enhanced the value of property in the vicinity, and at the recent sale of the old Post-office site it realised about £75 a yard, or nearly £50,000 in all. Of late there had been a revival of the dead bones in matters of street improvements and the erection of new buildings in the city. Prices of property, especially in business thoroughfares, were constantly increasing, and the corporation had now to pay two or three times as much to acquire it as they would have been asked to do 20 years ago. He would

not enlarge upon the buildings which within the last twenty years had added to the architectural aspect of Leeds, but merely call attention to the Yorkshire Penny Bank, the National Provincial Bank, Brown's Bank (now in course of erection), the Prudential Assurance Buildings, the new Medical School, and the extension of the Infirmary. So long as Leeds continued to grow in population at the rate of 7,000 a year, so long would its needs in every direction extend, and his successor in that chair 20 years hence would, no doubt, have ample scope for chronicling a Greater Leeds. There were several directions in which the municipal government of Leeds might effect reforms. The last Improvement Bill gave powers to the corporation to "regulate" hoardings and the bills with which they were covered. Nothing had been done in that respect. A regulation might be made that no hoarding should be allowed which did not leave a space between each board, say, of 6in. This would put a stop to the disfigurement of our streets by the advertising bills which now covered these erections. It seemed to be forgotten that the people of the city passed most of their lives in and about the streets, and that they were entitled to have their surroundings made as quiet, as orderly, and as comely as lies within the power of those whom they have elected to rule over them. Mr. W. E. Thorp proposed a vote of thanks to the President. The resolution was seconded by Mr. G. W. Bulmer, and was carried with acclamation. During the evening the society's prize of £2 2s. for measured drawings was presented to Mr. W. Driffield; and Mr. C. W. Tomlinson was the recipient of the President's prize of £2 2s. for sketches of old work.

NORTHERN ARCHITECTURAL ASSOCIATION.—The 39th session of this society was opened on Wednesday night at a meeting held at Newcastle-on-Tyne, by an inaugural address from the president, Mr. Frank W. Rich, who, in his introductory remarks, graphically sketched the changes that had taken place in the Association since he last occupied that chair as President fourteen years ago. He then proceeded to review the changes that had taken place in Newcastle during the sixty years of the Queen's reign. He showed that two broad circumstances had accounted for its increasing prosperity and marvellous growth—the mineral wealth of the district, and the birth of the railway system. He declared that to-day Newcastle would hold its own among the cities of England and Scotland, either for architecture, administration, or cleanliness.

PERTH ARCHITECTURAL ASSOCIATION.—The inaugural meeting of this association was held in the lecture-room of the Natural Science Society at Perth on the 9th inst., Mr. G. P. K. Young, A.R.I.B.A., the president, in the chair. The opening address was delivered by Mr. Hippolyte J. Blanc, R.S.A., Edinburgh. The chairman, before introducing the lecturer, explained the purpose for which the association had been formed. It had been originated and formed entirely by the young men in the district who were interested and actively engaged in architecture and engineering. With a view to carry out their desire of improving their knowledge in these subjects, they had combined together to obtain better facilities of study. The means they proposed to adopt were working classes, in which certain subjects would be given out for study and discussion under the guidance of one or two of the practising architects in the city. The society also proposed to give a few lectures during the season on special subjects, a course of interest to architects, and of information to the general public. The working class had already been formed, and the attendance was good, and the enthusiasm displayed most gratifying. They hoped by the end of the session to hold an exhibition of the work the students had done. Mr. Hippolyte Blanc said he wished the members success for the sake of those launching the association, as well as for those who might arise to attach themselves to it. There could be no doubt that the banding together of members of the same profession tended to the maintenance of professional etiquette. Yet he would remind them that, with all the advantages accruing to such associations, their influence for good was weakened unless there was a recognised freemasonry—a fraternal and confident co-operation—among its members. He desired to impress upon them that the enthusiasm of their beginning should be maintained as much as possible throughout their association. Such an association as this

should be raised upon the concrete of a fraternal communion with a superstructure of unaffected love for the profession. Another requisite was devoted study towards knowledge; but it must be patient, persistent, and consistent. All knowledge acquired would never make an artist; but it would at least prevent the errors and anachronisms which betrayed the untutored hand. To Ruskin's mind, there were two qualities which distinguished great artists—imagination and industry. Imagination was a high gift, though it could not be boasted that many artists possessed it. But industry had promised to it great rewards, and its exercise was within the power of all. What concerned them in this Association was the manner in which it could be made helpful primarily to young members of the architectural profession, and also to the public who interested themselves in art matters. There was knowledge which would not be useful to the architect, but it was not intended that an architect should be expert in all. He should, however, have such experience of all branches that in the interests of the public he, calling himself an architect, should prove himself competent to design a building that would at least be sound in construction and healthful without extravagant waste of material. How were all the requirements to be most readily attained by the student? The only way was, first, by a course of well-directed study, and second, by concurrent office practice during a specified number of years. He recommended five years at least. Mr. Blanc then reviewed the system of teaching on the Continent. Looking at home they found an absence of State aid, and the burden was, in consequence, laid upon communities to establish the necessary ateliers and larger schools for the architectural student. The actual defect of their system was the too great ease with which one could enter the profession, and after three or four years at very mechanical work in an architect's office, and without special study of any kind, commence the commercial pursuits of an architect. An association of this kind should exist primarily for instruction. It should be a nursery and training room for all entering the profession. In conclusion, he strongly advocated a careful study of perspective. A vote of thanks was accorded to Mr. Blanc on the motion of Mr. David Smart, architect, seconded by Rector Chambers. Mr. Blanc, in responding, dwelt on the advisability of instituting a library in connection with the Association, and offered as a nucleus gift Volumes I. and II. of the "Edinburgh Sketchbook."

THE NATIONAL ASSOCIATION OF PLUMBERS.—The half-yearly meeting of the National Association of Plumbers was held on Friday at Bradford. Delegates were present from 80 towns in England and Wales. The chair was occupied by Mr. John Beal, of Hull, the president, who was supported by Mr. W. Jaffrey (Manchester), Mr. A. E. Biggs (Leicester), Mr. R. W. Cooke (Newcastle), Mr. W. Skerrow (Leeds), and Mr. H. Blackburn (Dewsbury). The reports of the secretary (Mr. W. H. Smith) and the hon. secretary (Mr. J. Peattie, Oxford) were adopted. Mr. A. E. Biggs (Leicester), the organising officer, reported that he had visited Darlington, Middlesbrough, and Stockton. He had made very satisfactory progress in this district, but in Northampton he had met with little success. In Bristol, Cardiff, and Swansea he had done good work, and members who had joined had sent in their subscriptions. Mr. R. W. Cooke (Newcastle) said that the association was acquiring strength in that neighbourhood. Mr. W. Jaffrey (Manchester) reported in a similar strain, and he was supported by Mr. W. Skerrow (Leeds) and Mr. H. Blackburn (Dewsbury). Mr. Thomasson (London) said that in their district they had found that the best course was to appoint a paid secretary, and this had resulted in a considerable accession of membership. The secretary's report, which was adopted, showed that the association had been duly registered as a limited liability company. Several complaints had been received against masters, most of which had been settled to the satisfaction of the members concerned, and there had been small disputes with operatives at Bradford and at Derby, which the association had done its best to bring to a satisfactory conclusion.

In the case of Frederick Cook of Great Yarmouth, builder, the application for discharge from bankruptcy has been refused.

Engineering Notes.

G.W.R. EXTENSIONS IN NORTH WALES.—A new branch of the Great Western Railway Company from Brymbo to Coedpoeth and Minera was opened for passenger traffic on Monday. It is an extension of the passenger line from Wrexham to Brymbo. The new route to Mold from Wrexham, *via* Brymbo, Llanfynydd, and Coel Talon, is expected to be opened early in the new year. The new line, for which the Great Western Railway Company recently obtained Parliamentary powers, from Wrexham to Rhos, has been pegged out, and active operations will be commenced as soon as the specifications can be prepared. The doubling of the Great Western line between Ruabon and Corwen is being rapidly pushed on, as are also the new station buildings and platforms.

CHIPS.

The Berlin Bismarck Monument Committee have definitely entrusted the erection of the monument to Herr Reinhold.

The Earl of Jersey and Colonel Boughen, two of the commissioners appointed under the Light Railways Act, 1896, sat in the Manchester Town Hall on Friday to hear an application for an order to construct a light railway between Barton-upon-Irwell and Chorlton-cum-Hardy, through Trafford Park.

An inquiry was held at the Stroud Urban District Council's offices on Friday, by Lieutenant-Colonel A. C. Smith, upon the application of the urban council for sanction to borrow £600 for the renovation and purchase of the Stroud Baths. It was stated that the baths originally cost between £1,000 and £2,000.

The Escher Jubilee Memorial will take the form of a pedestal supporting a figure of Britannia standing upon the globe, and it will be erected in a prominent part of the village. The design is by Mr. F. J. Williamson.

A sub-committee appointed to consider the proposals for the reconstruction of portions of the Royal Infirmary at Glasgow have recommended for adoption plans prepared by Mr. James Thomson, of that city.

Mr. James Walker, consulting engineer to the Isle of Man Harbour Commissioners, has been appointed as chief engineer to the Tyne River Commissioners, out of 44 applications. The post is worth from £1,500 to £2,000 a year. Mr. Walker has carried out many important harbour works in the Isle of Man.

The newly-appointed health committee of the Liverpool Corporation, at their first meeting, have declined to grant an application for the retention of a sky-sign which had been erected in the heart of the city without permission for the same having been first obtained.

It has been decided to perpetuate the memory of the late Sir Isaac Pitman by placing a portrait of the deceased knight in the National Portrait Gallery, and a replica of the bust presented to him ten years ago in some prominent public building in the United Kingdom.

The newly-formed urban district council at Newport Pagnell have intrusted Mr. D. Balfour, M.Inst.C.E., F.G.S., of Newcastle-on-Tyne, to report on the existing pumping machinery at the waterworks for the town supply.

The scheme for the mural decoration of the Royal Exchange was advanced a further stage on Nov. 8, when the third painting was unveiled by Sir Faudel Phillips, who thus brought to a close his official connection with London as Lord Mayor. The subject of the latest panel is the demand of Charles I. for the surrender of the five Members of Parliament at the Guildhall, and this historical episode had been portrayed by Mr. Solomon J. Solomon, A.R.A.

Lady Jersey, laid, last week, the memorial-stone of public offices for the Southall-Norwood Urban District Council, to be built on a site given by Lord Jersey, at Southall, in commemoration of her Majesty's Jubilee.

At Eye, Suffolk, Mayor's Day was signalised by setting in motion the new Jubilee clock, which the outgoing mayor (Mr. C. Tacon) has presented to the town. A new turret has been added to the tower of the town-hall, from the design of Mr. G. W. Leighton, Ipswich. Mr. H. Skuffham built the tower and carried out other incidental alterations. The four dials of the clock are 4ft. 10in. in diameter, and are made of cast iron, in one casting, being closed up with opal glass for the purpose of illumination by gas, supplied by an automatic apparatus, worked by the clock.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 90c. gold). To France or Belgium, £1 6s. 0d. (or 3fr. 90c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—W. V. L.—O. W.—L. T. S.—D. C. B.—M. R. and Son.—A. L. P. Co.

"BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.—"Auld Syne," "Pantile," "Eldon," "Vim," "Spark," "Suburb," "Pen and Ink," "Chess," "Gib," "Crow," "Ant," "Grip," "Inexperienced," "Spectator," "Medusa," "And Co.," "Nowhere," "Derige," "Bantam," "Pup," "Eric," "Byd," "Simplicity," "Ivy," "Oak," "Microbe," "Hubert," "Phantom," "Gossip," "Wessex," "Spinningdale," "Centaur," "Strax," "Bow-Bells," "Wun-Hi," "Olliwops," "Bee," "Hotspur," "Industry," "Ard," "Turret," "Klondyke," "Chuckle," "The Man in the Moon," "Solo," "Don," "Chameleon," "Stone," "R. W. P.," "Kirk Hall," "Bernard," "E. G.," "Vita."

CORDEX. (You can use your own judgment whether the lodge is to be placed one side of the arch and the stables the other.)

Correspondence.

RE GEARY, WALKER AND CO.
v. HENRY YOUNG.

To the Editor of the BUILDING NEWS.

SIR,—Your last issue contained a report of this trial, and no doubt all who have read the same will have been struck with the extraordinary decision given against us. If such a decision is to stand, it will practically make it impossible for sub-contractors and specialists, such as ourselves, to do business. In this case a discount of 5 per cent. was quoted for *cash*, and it was stipulated that the work should be done to the satisfaction of the architect. It has been held, however, that an architect cannot be compelled to say he is satisfied; that if he is so disposed he can take ten years or longer before expressing any opinion whatever, and, presuming that at the end of ten years he does give an opinion that the work is satisfactory, the 5 per cent. *cash* discount could still be claimed!

We should like to have the opinion of specialists and sub-contractors on such a decision, which, of

course, we intend to contest at the first opportunity, as it strikes at the root of all business transactions between builders, sub-contractors, and architects.—We are, &c.,

GEARY, WALKER, AND CO.

IRISH AND ENGLISH ARCHITECTS.

SIR,—I regret the fact that Mr. Butler has gone out of his way to misread—wilfully or otherwise—my letter.

I did not say that the revival of the Architectural Association of Ireland was entirely due to Englishmen. I said it was left to an Englishman to start it, and Mr. Butler knows as well as I do that the Association would not be so far advanced, or even in existence, had not an Englishman come to the rescue and set it going.

I did not say that the Association pried into the religious belief and nationality of its members. When dealing with the subject of "wire-pulling," I was speaking generally, as a reference to my letter will show.—I am, &c.,

A GHOST THAT WALKED.

[This ends the discussion, which has become a mere personal wrangle.—Ed.]

CHIPS.

To meet the increased demand for their patent fireproof floor Messrs. Mark Fawcett and Co., of 50, Queen Anne's Gate, Westminster, have doubled the Nottingham output of "tubular lintels." New kilns and drying-sheds have been erected, more storage ground provided, and a large stock is now being kept, so that they can be obtained at short notice.

The ancient parish church of Duffield, near Derby, has been restored, a new side aisle has been added, and a stained-glass window erected. The work has been done by Mr. Bridgeman, of Lichfield, and has cost several thousand pounds. The church was reopened on Saturday afternoon.

A meeting of art masters, representative of the counties of Forfar, Fife, Perth, and Aberdeen, was held in Dundee on Saturday, to consider the question of forming an association of art teachers for the north-east of Scotland. Mr. T. Dalgetty Dunn, Dundee, took the chair. The proposal to found an association was adopted, and Mr. Dunn was appointed president; Mr. J. Lessel, Montrose, vice-president; Mr. W. R. Smith, Dundee, secretary and treasurer; and Messrs. W. Wilson, Kirkcaldy; R. Ogg, Aberdeen; H. T. Wyse, Arbroath; D. S. Murray, Dundee; J. Smieton, Perth; and J. Robertson, Dunfermline, a committee.

At St. Oswald's Church, Askrigg, on Friday, the Bishop of Richmond dedicated a new peal of six bells. The three old bells have been recast, and three heavier ones provided by Messrs. Mallaby and Sons, of Masham.

A new Roman Catholic church is in course of erection in Ferry-lane, Goring-on-Thames. It will consist of sanctuary, nave, belfry, sacristy, and porch, the sanctuary being 19ft. by 14ft., and the nave 44ft. by 21ft. internally. The accommodation will be for 105 people. The style is Perpendicular Gothic. The first portion to be erected will consist of the sanctuary and one-half of the nave. The contract price for the whole of the work amounts to £1,265. The contractor is Mr. E. McCarthy Fitt, and the architect Mr. W. Ravenscroft, F.S.A., both of Reading.

At a meeting of representatives of the building trade in Halifax on Wednesday night in last week, it was decided that the necessary steps be taken for the formation of a Builders' Exchange at Halifax. It was also agreed to alter the market-day to Wednesday. Mr. Firth, president of the Master Builders' Association, occupied the chair, and there was a large attendance.

Last week at the Estate Mart, Tokenhouse-yard, was not marked by any interesting features, the entire supply, with one or two unimportant exceptions, consisting of a very moderate class of properties. On one day only was any activity displayed, the result being that the aggregate realisation was only £66,521, as compared with £83,063 registered in the corresponding week of last year.

The partnership hitherto subsisting between E. A. Johnson and C. R. Williams, architects, civil engineers, and surveyors, of Merthyr Tydfil, under the style of Johnson and Williams, has been dissolved.

The Great North of Scotland Railway Company have found it necessary to add another station to their recently-constructed branch line from Ellon to Boddam, and have instructed their engineers to survey the route from Boddam to Peterhead with a view to the extension of the branch from Boddam on to Peterhead. The new station is to accommodate the granite traffic which proceeds from the Murdochhead district, and be constructed at the Bulters o' Buchan.

Intercommunication.

QUESTIONS.

[11843].—**L.C.C. Office.**—Can anyone inform me through your columns what the competitive examinations consist of to get into the London County Council engineer's or architect's department? Thanking you in anticipation.—A. D. B.

[11844].—**Water in Coach-House.**—I have this summer completed a coach-house. The floor is composed of 6 in. cement concrete with a 1 in. trowelled cement face; the walls are 9 in. thick, with asphalted damp-course, and the floor throughout is above the ground level. The sub-soil is sand. There is a plaster ceiling, and the room is heated with hot-water pipes. Yet, whenever the weather is cold or damp, pools of water appear all over the floor. I shall be glad if any of your readers can tell me what is the cause of this nuisance, and what remedy I can adopt.—CENTRIAN.

[11845].—**Speculative Building.**—Can anyone recommend a handbook relating to speculative building as a temporary investment, or to the purchase of house property as a permanent investment?—X.

REPLIES.

[11833].—**Painting of Galvanised Sheet-iron.**—As a practical engineer, with 30 years' special experience of galvanised corrugated sheeting, I would strongly recommend "Much Advised" to use a mordant or primer called "Uniter," for the first coat, and to afterwards apply a coat of oxide or lead paint. "Uniter" is a preparation whose special virtue is to induce perfect adhesion between the galvanised sheeting and the paint, which otherwise easily peels off if applied directly to the sheets. It is also a capital preservative to the zinc coating, as it prevents oxidation. My experience is that all preparations with copper or acid as one of the ingredients should be avoided, as a chemical action is at once set up which destroys the zinc. "Much Advised" will soon see this for himself by applying some of the first solution recommended by "H. C. S." to a small amount of the sheeting, when he will see the zinc coating turn black and be almost instantly destroyed. By the way, I am surprised to observe that this receipt mentioned by "H. C. S." is given in a well-known leading book on "Building Construction," and all architects and engineers should be warned of its destructive properties.—CHAS. THOMAS, Bristol.

[11835].—**Parchment Plans.**—To prevent ink and colours "running" on parchment, first sponge the surface with beef-gall, and allow same to dry. The gall should be prepared before use as follows:—Put into an enamelled saucepan 45 parts (by weight) of beef-gall, with an equal quantity of water, and boil it for ten minutes or so; then add 2 parts (by weight) of alum; stir the mixture for half an hour, and, when cold, filter; then mix with the decolourised gall one-eighth part of proof spirit (anhydrous spirits of wine—i.e., alcohol free from water); let the mixture stand two days, then pour off the supernatant liquid; the alum, in crystals, will remain in the vessel. Use the clear fluid as directed above.—H. C. S.

[11837].—**Pavement Slabs.**—A perusal of the articles on "Artificial Stones" in a recent number will give "Aberdeen" all the information required.—H. C. S.

[11838].—**Measuring Off Works.**—It is not unusual for a contractor to be represented by his own surveyor in checking the architect's measurement of additions and deductions. Of course, the terms of the contract have something to do with the question of measuring up. Two surveyors, one representing the architect and the other the contractor, are often employed in such works at the adjustment of accounts. The quantity surveyor generally acts for the architect and builder, he having for his guidance the deposited bill of quantities and the schedule of prices deposited. The best way is for the quantity surveyor to obtain from the architect, or his clerk of works, and the builder a list of works claimed as extra on contract. Sometimes the surveyor and architect or clerk of works meets the contractor and his surveyor, and they go through the items, which are then admitted as extras or not by the surveyors, and measured. The omissions are also gone through at the same time, and set against the extras. Differences of opinion and of rates ought properly to be made and settled between the two surveyors, and so avoid a reference.—G.

[11839].—**Blisters.**—The peeling of the paint on blisters over knots in wood is due to the exudation of resinous matter out of the knot itself. This is one cause; another cause is due to the "patent knotting," which has been dabbed over the knot in the wood previous to painting it. This compound is a mixture of shellac in methylated spirit, and consequently there is no adhering surface for the paint where the shellac has dried. In the case of blisters occurring where there are no knots, it will probably be found that such blisters are due to the accumulation of water gathered up out of the fibre of the wood which, by accumulating under the paint, bulges it up. While the water is being gathered up in little heaps like this, the paint remains soft, and if painted will allow water to exude from beneath. When the accumulated water cannot escape from the exterior surface by the paint, it will in time be reabsorbed by the wood, and consequently the skin of paint that has been bulged up will become dry and chip off at the slightest touch.—H. C. S.

[11840].—**Measurement of Stonework.**—Many surveyors object to describe stone as including all labour, and they follow the old-fashioned mode of measuring stone in rough blocks and then measuring the labour in detail. One objection to the measurement of stone including labour is that the items are not clearly distinguished, and the builder hardly knows the exact kind of labour included, or the quantity of it. When the labour is measured separately, the stone is taken per foot cube, including waste, hoisting, &c.; the beds and super. foot circular beds and joints, sunk beds, &c., each kind being measured according to the rules given in text-books. The London practice of measuring stonework follows this rule. All faces are measured except beds and joints, in which one face measured represents two faces.

In all cases of "stone and labour" state what faces are rubbed, tooled, or otherwise treated. I should advise "Student" to consult Mr. Leaning's "Quantity Surveying" for examples.—G. H. G.

[11842].—**Artificial Stones.**—See reply to "Pavement Slabs" above.—H. C. S.

CHIPS.

The Painters' Company offer a travelling studentship of £50 for the encouragement of the study of decoration. It is open to competition by students between the ages of 20 and 25 in any recognised school of art or other institution devoted to the study of applied art in any form and situate within the limit of the larger Metropolitan postal area. Full particulars can be obtained from the clerks, Painters' Hall, 9, Little Trinity-lane, E.C.

The Jubilee Memorial Convalescent Home Committee at Bristol have been informed that Mr. E. P. Wills intends to contribute £20,000 towards that object. With this addition the total donations up to the present amount to £80,000.

The statue of the Queen which Mr. Bernard Tolhurst is presenting to Southend-on-Sea is on its way to that town. The statue has been executed by Mr. J. M. Swynnerton in his studios at Rome. It has been carved from a solid block of Carrara marble, and weighs seven tons. It will stand, with the pedestal, about 20ft. in height.

As the result of the preliminary examination made by Colonel Sir Thomas Holdich, the well-known head of the Indian Survey Department, whose services were lent to the Ceylon Government last winter by the Government of India, a new survey is to be made of the island. The cadastral survey will be on a scale of 10 in. to the mile and the topographical on one of 1 in. to the mile. The triangulation and topographical survey will be completed in five or six years; but considerations of expense will cause the cadastral survey to be spread over a period of 25 years, and to be restricted to Crown lands and lands of doubtful ownership. The existing maps of Ceylon are full of errors, and for every grant made out of Crown lands a special and expensive cadastral survey of the locality had to be executed.

In consequence of the rebuilding of their offices, Messrs. Eastwood and Co., Ltd., have removed to temporary ones at 41, Temple Chambers, Temple-avenue, Victoria Embankment, E.C.

The new buildings which have been added to Elswick Wesleyan Church, at the cost of Alderman W. H. Stephenson, J.P., to be used as ladies' parlour and vestries, were formally opened and handed over to the circuit on the 15th inst. They have been erected by Mr. Thomas Hutchinson, from the designs of Mr. John D. Dyson, architect, of Newcastle.

On Monday, the 15th inst., the first sod of the new Cottage Hospital, Nuttall-lane, Ramsbottom, was cut by Mrs. Aitken, of Holcombe Hall, who is defraying the whole of the cost and presenting the building to the town. The contract has been let to Messrs. Platt and Castle, of Ramsbottom, and the work is from designs and under the superintendence of Messrs. Haywood and Harrison, architects, Accrington and Lytham. The cost is about £3,000.

The Glasgow joiners' officials have posted notices in all the shops intimating that no man is henceforth to hang doors or deal with any manufactured joinery imported from the United States. Speculative builders at Glasgow, it is stated, have lately been importing all classes of manufactured wood from America.

Plans have been completed for the new Parliament Houses in Perth, Westralia, the estimated cost of which is £150,000. Another contemplated pile, which will cost a similar amount, is the new Law Courts, also in Perth. Contracts for both of these important undertakings will be invited early in the new year. In addition to these Government buildings, there are numerous contemplated erections of considerable magnitude, both in Perth and Freemantle, which will keep the builders of Westralia busy for some time to come. Contracts for three new railways in the colony have just been placed with Messrs. C. and E. Millar. Of these railways one is from Kalgurli to Menzies, 81 miles; another is from York to Greenhills, 14 miles; and the third is from Kalgurli to Kanowna, 12 miles.

The Red Lion Hotel at Debenham, Suffolk, has been enlarged and partially remodelled from plans by Mr. Frank Brown, of Princes-street, Ipswich. Mr. H. Gooding, of Debenham, was the builder.

Colonel Albert J. Hepper sat at the urban council offices, Hebden Bridge, on Friday, to take evidence on behalf of the Local Government Board with regard to an application made by the urban district council of Hebden Bridge to borrow the sum of £2,750, for the provision of a refuse tip. Mr. Shaw, for the council, stated that the land proposed to be acquired contained an area of 3½ acres, for which the council had agreed to pay £730, including the timber on the land.

LEGAL INTELLIGENCE.

OWNERLESS DANGEROUS STRUCTURES.—"The owner" of the premises No. 55, St. George's-street, E., was summoned to the Thames Police-court, at the instance of the London County Council, for alleged offences under the Dangerous Structures Act. Mr. Godfrey, in support of the summons, was about to open his case, when Mr. Biron, counsel, said he appeared for Mrs. Farrow, the original owner of the property, who had disposed of the lease to Mr. Nye. Mr. Hodgson, barrister, denied that Mr. Nye was the person who should have been summoned. A discussion having ensued, Mr. Dickinson said under the recent judgment the time of the Court had to be occupied in holding a preliminary inquiry as to who was the owner. The Council had to see dangerous structures were not permitted to exist, and if they were allowed the public would quickly raise an outcry, and he would see they were protected as much as possible. Mr. Augustus W. Turner, district surveyor for St. George's, said he surveyed the premises on Sept. 3, and found them dangerous. The back wall and upper part of the front wall were dangerous, and up to one o'clock that day nothing had been done. The place was eminently dangerous, and might fall down while the learned counsel was discussing the matter. The case was adjourned. Mr. Godfrey remarked there were about 1,500 of the summonses during these years.

A STREET-MAKING ACTION.—His Honour Judge Ingham was occupied a long time at Rugby County Court, on Friday, in deciding whether Mr. Thomas Hall, contractor, Rugby, had made two streets—Worcester-street and Essex-street—in accordance with specification. Mr. Hall, who figured as plaintiff, claimed from Mr. T. W. Millard, architect, Rugby, the sum of £70 6s., balance of the contract, £997, while Mr. Millard counter-claimed for £1,200 for breach of contract and cost of putting the streets into proper order. For the plaintiff, Messrs. J. T. Eayres (Birmingham), W. Willmott (surveyor, Birmingham), W. Purnell (assistant borough surveyor, Coventry), and other experts gave evidence to the effect that the metalling was of the thickness required after allowing for compression caused by steam-rolling; while, on the other hand, the defendant and numerous witnesses declared that it was several inches too thin, and the urban district council had refused to take to them in consequence. His Honour gave judgment for the defendant on the claim, and for £200 on the counter-claim.

BUILDER V. BRICKMAKER.—MOORE AND BRISTOW V. MULLANEY.—In this case, tried at the Stockport County Court, and reported in our last issue on p. 709, his Honour Judge Yate Lee has given his decision. The plaintiffs are brickmakers, of Stockport, and they sued Dennis Mullaney, a builder in the town, for £70 12s. 8d. for bricks supplied. The chief point at issue had reference to the quality of the bricks supplied, the contention raised on behalf of the defence being that about 60,000 of them were of an inferior kind, necessitating the purchase of bricks elsewhere. For these defendant had to pay a higher price than for which he bargained with the plaintiffs, and he estimated the loss he had thus sustained at £36 8s. 6d. He had counter-claimed for that amount, but the claim was not entered in time, and therefore had to be abandoned. His Honour, in delivering judgment, reviewed the evidence at some length. The statement that the plaintiffs supplied the defendant with 60,000 or 70,000 inferior bricks seemed incredible. Another question on which the credibility of the case turned was this. The plaintiff Briscoe said he saw the defendant twice during the period occupied in the delivery of the bricks, extending over some five months. The defendant, on the other hand, swore that from March to July he saw the plaintiff every two or three days. It was obvious that there was the most gross perjury on the one side or the other. The question was, which of the statements was true? The defendant could give no particulars of his interviews with the plaintiff, and, therefore, he (the judge) could not believe what he said. It appeared to him the defendant had failed to make out any definite number of bricks which were bad, beyond the 500 which were admitted on the part of the plaintiff. His Honour put the value of these 500 at 11s. 6d., and taking that off the claim, there remained a balance of £70 1s. 2d., for which he gave judgment, with costs. Special costs incidental to the remission of the case from the High Court were allowed.

BIG ARBITRATION CASE AT MANCHESTER.—At the Grand Hotel, Manchester, an arbitration to assess the compensation to be paid by the Great Northern Railway Company to Messrs. Samuel Gratrix, jun., Brother, and Co., Ltd., in respect of the acquisition and demolition of their premises in Alport Town, Manchester, was begun on Tuesday, before Mr. James Green, surveyor, of London, sitting as umpire. Mr. Freeman, in laying the facts before the umpire, described the properties in question, which consist of extensive business premises and a public-house known as the Black Horse. It had been agreed, counsel said, to keep the cases separate,

and that relating to the business premises would first be proceeded with. These premises had been occupied by Messrs. Gratrix for many years in the conduct of their business as lead, glass, oil, paint, and colour merchants, brass foundry, metalworkers, sanitary plumbers, and electrical engineers. The site consisted of 2,601 square yards, exclusive of the public-house. At the end of 1894, having learnt that the railway company were proposing to take the area on which their premises stood, Messrs. Gratrix purchased a site in Quay-street, upon which to erect new premises, and to these new premises the business would be removed before the end of March, 1898. Counsel went into the particulars of the claim, and said that the total sum in round figures worked out to about £111,600. Evidence in support of the claim was given by a number of witnesses. The inquiry is expected to last till Wednesday or Thursday in next week.

CHIPS.

Next week the Bridges Committee will recommend the London County Council to authorise them to proceed forthwith with the construction of the Greenwich Tunnel, the estimated cost of which is £70,500.

A new church is about to be erected in Horton Grange-road, Listerhills, near Bridport, from plans by Messrs. T. and H. Healey, of the latter city.

A stained-glass window was dedicated to St. Joseph's Roman Catholic Church, Swansea, last week. The subject is the Ascension, and the artist Mr. Westlake.

St. Mark's Parish Church, situated in Groves, Hull, was reopened by the Archbishop of York on Friday. The interior of the church has been entirely restored and new clergy and choir vestries built, at an aggregate cost of £1,000.

Henry Taylor, living in Colville-road, Acton, has been remanded on a charge of falsifying accounts and detaining the books of the Wandsworth Branch of the General Union of Operative Carpenters and Joiners. The prisoner was secretary to the Wandsworth branch of the union. He absconded in the early part of the year, and although the warrant was granted as far back as January last, he could not be traced until Wednesday in last week, when he was arrested.

Sitting as a Deputy High Bailiff at the Westminster Town Hall, on Nov. 11, Mr. Troutbeck and a special jury heard the case of Mellor's Trustees v. Her Majesty's Office of Works, a claim being made for £28,000 as compensation for the freehold interest in premises occupied by the Aërated Bread Company at the corner of Parliament and Great George streets, Westminster. Among the claimants' expert witnesses were Alderman Sir Whittaker Ellis, Bart., Mr. Tewson, and Mr. Bousfield; while Mr. R. Vigers, Mr. Galsworthy, and Mr. Horne gave evidence for the Crown. The jury returned a verdict for £26,000.

Colonel C. H. Luard held a Local Government Board inquiry at Leamington, on Friday, into the application of the corporation to borrow £900 for works of street improvement.

At Trevord Viaduct, on the Cornwall Railway, between Liskeard and Menheniot, a new five-arch viaduct of granite is being built by Messrs. Pelf and Sons, contractors. On Monday, while one of the wooden ribs was being fixed, upon which the brick-work of an arch would afterwards rest, the rib overturned, precipitating William Cotton and Richard Toms to the ground, nearly 80 ft. below. Cotton, 19 years of age, was killed instantly, and Toms, an ex-naval seaman, aged 32, expired while being borne to the Liskeard Cottage Hospital. At the inquest on Wednesday "Accidental Death" was returned; but the jury added that in their opinion there should be more careful supervision in works of so dangerous a character.

The ceremony of unveiling a bust of Michael Faraday was performed at the Michael Faraday Board School, Faraday-street, Walworth, by Sir J. Crichton Browne, F.R.S., on Monday. The bust, which is of white marble, was presented to the school by the managers of the Royal Institution of Great Britain, and is a copy of the original bust executed by Matthew Noble. It stands upon a pedestal of Aberdeen granite, 4 ft. in height, and has been placed in the boys' hall of the school. On the wall immediately below is a brass bearing an inscription.

At the meeting of Oxford Convocation on Tuesday, a decree was unanimously passed authorising the Drapers' Company to erect a new building for the Radcliffe Library, on a site facing the South Park's-road, Oxford, and constituting a wing of the museum corresponding to the Clarendon Laboratory, from designs from Mr. Jackson, R.A. The Master of Pembroke reminded the house that this decree was simply consequential upon the acceptance last summer of the great liberality of the Drapers' Company.

WATER SUPPLY AND SANITARY MATTERS.

TONBRIDGE.—On Friday afternoon, by invitation of the directors of the Tonbridge Water Company, the members of the urban district council inspected the new storage reservoir, which is being constructed close to the pumping station at the works. Though close to the town, and immediately on the banks of the Medway, the works are believed to be free from any contaminating influence. The reservoir was designed by Mr. James Lees, the company's engineer, and, in digging out the space required, several trunks of trees had to be removed, showing that at one time the site was part of the great forest, in the centre of which Tonbridge, with its castle, was situated. The new reservoir is upwards of 20 ft. deep. The walls are composed of concrete 4 ft. wide at the bottom, tapering to 2 ft. at the top. The roof is built on piers, and arches of white enamelled bricks, with cement and spandrels and springers from the arches. Mr. T. Langridge was the contractor.

The partnership, heretofore subsisting between A. Marshall and G. Turner, of Nottingham, architects and surveyors, under the style of Marshall and Turner, has been dissolved by mutual consent.

Herr Wilhelm von Riehl, Professor at the Munich University, died in Berlin on Tuesday, aged seventy-four. In 1853 Riehl was appointed by King Maximilian II. of Bavaria Professor of Munich University, and in 1885, while retaining his professorship, he became Director of the Bavarian National Museum and Conservator General of the Monuments of Art and Antiquities in Bavaria.

The Local Government Board have sanctioned the application of the Southend Corporation for a loan of £3,418 for sea defences.

The workmen in the employ of Messrs. Fred. Bennett and Co., of Ipswich, who have been engaged in rebuilding the premises occupied by Mr. E. W. Gilbert, draper, 10, Tavern-street, in that town, were entertained at dinner last week. The work is being carried out under the direction of Mr. J. Shewell Corder, of Ipswich.

In the Queen's Bench Division on Tuesday, before Mr. Justice Mather and a special jury, Thomas Oakley Bennett, surveyor, of Burton, Somersetshire, and chairman of the local parish council, was sued for damages for alleged slander by Thomas Carhart, formerly proprietor of the Blue Bell at Burton, and Mrs. James Carhart, his wife. The slander was to the effect that plaintiff was alleged to have informed one of the firm of brewers owning the Blue Bell, that Mrs. Carhart had insulted him, and forbidden him the house. The jury found a verdict for the plaintiffs, and assessed the damages at £250.

A new channel has been constructed at Teddington Weir by the Conservators of the River Thames. This work will in wet seasons have a beneficial effect by providing a greatly increased outlet for flood waters. Sir F. D. Dixon-Hartland, M.P., the chairman of the Board, will open this channel on Monday afternoon next.

The parish church of Sible Hedingham has been restored. A carved oak screen has been placed across the chancel aisle, a new roof has been placed over the nave, new windows with stained glass have been put in, the floor has been laid with tiles, and the insides of the seats have been laid with blocks of pitch-pine, while the middle of the nave has been resealed. The contractors for the work were Mr. Parmenter, of Braintree, and Mr. W. J. Elsdon, of Sible Hedingham. Mr. Walter Clark, of Halstead, executed the oak screen.

At Sunderland on Monday, Mr. Maynard held an inquest on the body of Geo. H. Humble, surveyor to the Sunderland Rural District Council, whose dead body was found in a field on Saturday morning. He had been missing about a fortnight, and had evidently committed suicide by drinking carbolic acid, a 6oz. bottle which had contained that poison being found by his side. The body was badly disfigured, the ears and face having been gnawed by rats. A verdict of "Suicide whilst temporarily deranged" was returned.

The markets committee of the Leeds Corporation appointed on Monday a sub-committee to obtain tenders for the erection of a Wholesale Dead Meat Market and Abattoir on ground at Harper-street, York-street, at the estimated cost of £18,000. The plans were prepared by Mr. Walter Hanstock, architect, Leeds and Batley.

The widening of the Great Northern Railway from King's Cross to Huntingdon is rapidly proceeding. The company's engineers on Sunday performed a remarkable feat in reconstructing the old iron bridge south of Hatfield, and over which run four lines of railway. Traffic was temporarily suspended, and with every necessary appliance in readiness, the old bridge was removed and replaced by a new iron-girder bridge, the work being accomplished in about fifty minutes.

Our Office Table.

THE *Daily Chronicle* of Saturday last blundered in connecting Burgess's name with a nonsense verse (made for studio amusement only) by Dante Rossetti. Apart from its literary form, as printed in that paper, which, says the *Pall Mall Gazette*, is so slovenly as to make Rossetti's ghost shudder, the original referred to "a builder named Burges"—in fact the architect, William Burges, A.R.A., quite another artist, whose rather infantile manner lent point to the final line of the original, which run thus:—

There is a young builder named Burges;
From childhood he scarcely emerges.
If you were not told
He's decidedly old,
You would offer a bull's-eye to Burges.

It was also a studio joke to call Burges "Pretty Burgess," to distinguish him from Burges, whose appearance was more homely than that of the painter.

The imperative necessity for widening Lower Thames-street between Botolph-lane and Fish-street-hill was brought before the City Commissioners of Sewers on Tuesday by the Improvement Committee, who reported that in this portion of Lower Thames-street the width between the houses varied from 28 ft. to 30 ft., the carriage way from 17 ft. to 18 ft., being only sufficient for two vehicles at a time. Consequent upon the recent construction of Monument-street a small portion of Thames-street had been widened to the extent of 40 ft. They submitted plans for making the thoroughfare from Botolph-lane to Fish-street-hill 40 ft., 50 ft., and 60 ft. wide respectively. The cost would be either £151,500, £171,100, or £190,000. The existing accommodation was utterly inadequate to the requirements of business. But before coming to any decision they recommended that the plans and estimates should be submitted to the London County Council, and their views invited in reference to the alternative schemes. The report was unanimously adopted.

MR. A. CREER, the city engineer of York, met with an accident while inspecting the septic tanks at Exeter last week with a view to the possible adoption of the system in York. While Mr. Creer was in the septic chamber observing the chemical action set up in the sewage an explosion took place, with the result that he sustained severe burns and a shock to the nervous system. He has since been confined to bed at Exeter, and has been attended by Dr. Cattley, the medical officer of health for York, and nursed by his wife. It is stated that a precisely similar accident happened a few weeks since to the city surveyor of Belfast in the same chamber at Exeter.

DURING the past week the second, third, and fourth of the present course of Rhind lectures have been delivered at the Scottish National Portrait Gallery, Edinburgh, by Dr. James Macdonald, the subject of the series being, as we noticed last week in a *résumé* of the first address, "The evidence for a Roman Occupation of North Britain." In his second discourse Dr. Macdonald dealt with the literary evidence of the occupation, referring at considerable length to the narrations of Herodian Xiphilia (Dio) and Spartian, concerning the expedition of Severus against the Caledonians, circa A.D. 210. The evidence of Gildas, Bede, and Nennius was dealt with by the lecturer, and brief references were made to the statements of Mediæval chroniclers and of later writers down to Horsley. The appearance of the forged treatise, "De Situ Britannie," was shown to have had a most mischievous effect. General Roy and others, long regarded as authorities, were led by their belief in its genuineness to promulgate opinions that had no foundation in fact. In his third lecture Dr. Macdonald prefaced the archaeological evidence of the occupation, to which he now passed on, by a short account of the means the Romans took to shelter their soldiers when in an enemy's country, and to protect their frontiers from attack. This was followed by a brief sketch of the organisation of the Roman army under the Empire. In North Britain the most important Roman field work was the Pius Vallum on the Forth and Clyde isthmus. Recent excavations by the Glasgow Archaeological Society had revealed to us the structure of its different parts, which was imperfectly known before. It consisted of a military way; a wall, built to a

large extent, at least, of sods, prepared and laid by the hand, a ditch of the V-shaped type, and the outer mound. The more important antiquities found at or near the Pius Vallum were, for the most part, distance slabs and altars dedicated to various deities.

In his fourth lecture, Dr. Macdonald dealt with those rectilinear entrenchments classed by the older writers as Roman stations. Apart from the forts of the Pius Vallum, there were at present only seven such localities that could be shown by the remains of antiquity found within or near them to be the sites of Roman permanent examples. These were Birrens, in the south-east of Dumfriesshire; Cappuck, near Jedburgh; Newstead, near Melrose; Cramond and Inveresk, both on the Firth of Forth; Camelon, west of Falkirk; and Ardoch, north of Dunblane. Birrens had lately been thoroughly excavated by the Society of Antiquarians of Scotland with fruitful results. Below the grassy sward there had long lay concealed the foundations of a military station planned with the utmost precision. The number and extent of the several buildings were ascertained almost to completeness. Several altars, most of the fragments of a large tablet bearing the date A.D. 158, a quantity of Roman pottery, and many small objects were dug up. After describing the Roman antiquities discovered at Cappuck, Newstead, Inveresk, Cramond, and Camelon, the lecturer proceeded to give account of recent excavations by the Society of Antiquaries at Ardoch, the north-east quarter of which was examined. The holes and trenches there found filled with black dust proved the former existence of wooden buildings resting on posts and planks, one of which must have been the pretorium. There were also met with specimens of pottery and small pieces of two inscribed tablets. The lecturer discussed the claims of five other forts classed as Roman stations by General Roy—Strageth, north-west of Ardoch; Castle-dykes, near Carstairs; Bertha, at the junction of the Almond and the Tay; and Burghhead, on the Moray Firth. Excavations at Raeburnfoot within the past fortnight by Mr. James Barbour, for the Dumfriesshire Antiquarian Society, had resulted in the finding of pieces of coarse pottery and some other indications of a possibly temporary Roman occupation. Summing up, the lecturer said he thought it proved that in the eastern lowlands of Scotland, from the Border as far, at least, as the lower valleys of the Forth and Clyde, there were certain Roman camps of occupation, generally some distance apart, which were evidence that the Romans had for a time more than a passing hold on that part of the country.

At the last meeting of the city council of Bristol the discussion was renewed on the proposal of the visiting committee of the City Lunatic Asylum at Fishponds to extend the buildings under the supervision of a clerk of works at an estimated cost of £45,000. Mr. Terrett moved that the resolution approving of this action be rescinded, and pointed out that it was contrary to business usage to undertake so large a scheme as this without the assistance of a professional architect. He had figures which went to show that the sum intended to be spent was excessive. At Birmingham work averaged out to £125 per bed; Essex, to £125; Hull, £110; Hanwell (under the London County Council), £80; Glamorgan, £171; Herts, less than £200; Croydon, under £210; Winnick, £145; Hants (an extension), £82. It was said the beds at their own asylum would work out to £210 apiece, but that was based on the estimate of £31,000. And, now that the cost was going to be £45,000, the average per bed would be raised to £280. Mr. Bastow, builder, seconded the motion, but it was opposed on the ground that matters had gone too far for the committee to reverse their action, and on a division Mr. Terrett's motion was rejected. The chairman of the committee offered to subject the plans and elevations to the city surveyor for approval, and this was agreed to, although it was pointed out that that official is not an architect.

A curious state of affairs is reported with regard to Kilmallock Castle, a reputed residence of the Desmonds, which some few years ago would have been demolished but for the intervention of the County Limerick grand jury. The structure is now in a dilapidated condition, and, overhanging as it does the public road to Limerick, is dangerous to traffic. The necessary repairs, however, cannot be executed owing to the action of a tenant who is in possession of the

basement of the tower, using it as a smithy, and who refuses to quit the premises unless he gets £500 compensation. The tenant will accordingly have to be evicted unless—of which there seems no likelihood—he can be induced to give up peaceable possession. The Board of Public Works will, it is understood, take charge of the ruin, which is interesting only from its historical associations.

MR. JAMES PATON, curator of the Glasgow Corporation Art Galleries, delivered, on Tuesday night, in the Corporation Galleries of that city, his third weekly address on Italian art, dealing on this occasion with "Botticelli and His Contemporaries." Mr. Paton referred to the condition of Italy in the early 15th century—to the decline of religious zeal and general culture. Literature had fallen away from the eminence of Dante, Petrarch, and Boccaccio. There was no political stability in the land, which was split up into numerous small States, republican cities, and paltry despotisms, in which there was incessant change, treachery, warfare, rapine, cruelty, and murder. The general anarchy caused longings to arise after the national strength and unity of classical times, which led to the study of ancient history and literature, and finally to a Classical revival in sculpture, architecture, and pictures. Mr. Paton then referred to the contemporaneous introduction of the printing press and painting in oil. The use of oil and varnish in painting was equivalent to a new instrument in music. It gave the artist a better range, produced greater brilliancy in tone, and increased the possibility of finer and more delicate modulations in colour. Previous to the introduction of oil the principal form adopted was fresco, but this was now changed to the panel picture. Mr. Paton concluded by dealing specially with the works of Botticelli, Signorelli, and Ghirlandajo.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Surveyors' Institution: "The Manchester Ship Canal Compensation Cases," by J. D. Wallis, F.S.I. 8 p.m.

TUESDAY.—Institution of Civil Engineers: "Central Station Electric Coal Mining Plant in Pennsylvania," by W. S. Gresley, 8 p.m.

WEDNESDAY.—Society of Arts: "Progress of Metallurgy and Metal Mining in America during the last Half-Century," by Prof. Jas. Douglas, 8 p.m.
St. Paul's Ecclesiastical Society: "Variations of Material for Altar Linen" and "The Beginning and Growth of the Usage of a Second Gospel at Mass," by Cuthbert Atchley, 8 p.m.

THURSDAY.—Sanitary Institute: "Sewerage and Sewage Disposal," by Prof. Henry Robinson, M.Inst.C.E., Parkes Museum, 9 p.m.
Birmingham Architectural Association: "Repairs and Restoration," by Thackeray Turner, 6.45 p.m.

FRIDAY.—Architectural Association Conversazione and Musical Play, Matina Theatre, Langham-place, 8 p.m.

The Society of Architects.

Founded 1884. Incorporated 1893.

THE FIRST ORDINARY MEETING of The Society of Architects for the Session 1897-98 will be held at the Rooms of the Society, at St. James's Hall, Piccadilly, W., on THURSDAY, November 25th, 1897, at Eight o'clock p.m., when the OPENING ADDRESS will be delivered by Mr. T. WALTER L. EMDEN, J.P., President.

ELLIS MARSLAND, Hon. Sec.
MONTAGU BALDWIN, M.A., Sec.

The organ in the parish church of Inveresk, N.B., will be reopened to-day (Friday) after enlargement carried out by Messrs. Lewis and Co., of Brixton, S.W.

Rosewell Parish Church, N.B., after having been closed for seven months to permit of extensive alterations, costing fully £700, was reopened on Sunday. The architects for the renovation were Messrs. Hardy and Wight, George-street, Edinburgh.

The trustees under the Birmingham Churches Act, 1897, are now negotiating for the sale of the site of Christ Church, together with the building materials, but exclusive of the internal fittings of the church. The property is to be sold subject to all rights of light and other easements, and to the condition that no licensed house, nor licensed place of public entertainment, shall at any time be erected on the site. The catacombs will be sold with the church, and in the early part of next year the bodies will be removed. That of John Baskerville, the celebrated painter, will be removed to the churchyard of St. Philip's Birmingham, where it will rest beside that of his wife; the stone which marks her grave is a well-known feature of the churchyard.

Nottingham—Eight Board Schools			

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2233.

FRIDAY, NOVEMBER 26, 1897.

LEVELLING DOWN PROCESSES.

PEOPLE who travel northwards (say to any of our great Yorkshire or Lancashire cities) will find buildings having all the resemblance in features and details to those of London or localities farther south. In Leeds, Bradford, Halifax, or in Manchester, Liverpool, or Bolton, one sees buildings of stone and brick, and for various purposes that might equally well have been erected in London, or Brighton, or Portsmouth. We are not now speaking of large public or palatial buildings chiefly, but of the smaller commercial and domestic buildings. We may wonder at this likeness when we consider how many hundreds of miles separate us, and what the different materials and modes of habit of the districts are. The same astonishment would be excited in the minds of the citizens of those Northern towns who happened to visit London and see buildings of stone of the same massive and lavish character. What is there to distinguish, for instance, between such buildings as those of The Exchange or Assize Courts, Manchester; or those in Deansgate or in St. George's-square and Castle-street, Liverpool, and those in London—we mean as to their general characteristics and features? Nothing is seen to indicate any differentia as to material, their method of treatment, or the uses of the building such as we might have expected, and which a few centuries ago obtained. And what rapid progress has been made in Liverpool! The president's address (Mr. W. E. Willink's) delivered the other day before the Liverpool Architectural Society, pointed to the wonderful development made in architecture alone in that city since St. George's Hall was projected. Since 1836, when the population was not a quarter of a million, the buildings erected were comparatively meagre; great developments have been made, and the number of architects has been trebled. During the last fifty years the architecture of all our great cities has become more assimilated, their local peculiarities having gradually disappeared, or have softened down; but it has been so with every other branch of enterprise, and even people themselves in that time have shaken off their insular prejudices and irregularities of habit and disposition. Railway intercommunication and facilities of travel have been the chief agencies in bringing about this general leavening of the masses. The local habits of thought and speech have been rubbed off, and it has been so with architecture. The old towns of the North displayed 50 years ago a certain local character of their own, which has gradually disappeared, and we have now in its stead, stately and pretentious buildings—not always in good taste, but which embody the prevailing methods and characteristics of modern architecture of the official order. Classic, Renaissance, and Gothic are the styles one generally sees, and these have entirely supplanted the local style and character of the older buildings. Such edifices as St. George's Hall, Liverpool; the Walker Art Gallery, the Town Hall, Leeds, and the Mappin Art Gallery, Sheffield (the last three recent structures), appear to show a strong Classic feeling in the North. In one sense they are in keeping with localities in which stone is the chief material; but we can scarcely say they are suitable in style for cities in which the climate is by no means favourable. But Gothic has

been encouraged also; the Manchester Town Hall, the Corn Exchange, Sheffield, of brick and stone, and other buildings compare favourably with the Gothic work elsewhere, and in the latter town we see several school board buildings of brick in this style. To take Sheffield as one instance of a modern town where progress has been made in building, much is attributable to the influence of a few architects like Messrs. Flockton and Gibbs, Messrs. Hadfield, and others. Brick is largely used with good effect, as in the Corn Exchange, and in many business premises. Mr. Mountford's municipal buildings are the most important contribution of a Renaissance or Late Gothic character. We have instanced these buildings to show how entirely one commercial town can become representative of all that is modern in architecture, to the extinction of older local modes. Uniformity of building has been adopted in our great cities, and this has been promoted in several ways. First by mechanical means. Under this head we may include improvement in machinery and labour-saving apparatus for lifting heavy materials, and other developments in building. It has become possible now by easy transport and mechanical labour-saving and lifting apparatus to use the same granite or stone in London as in Glasgow or Yorkshire, and with little extra expense to export bricks from the South or clay districts to localities surrounded by the largest quarries. Has not machine-worked labour done away with much of the distinctiveness and local treatment of hand-worked stone masonry, and brickwork, and had a tendency to reduce all work to one level? In the old days masons worked their material by tools and methods peculiar to the district; they had a personal interest in their work; they were often quarrymen or quarry owners who had the most direct interest in seeing that the proper stone was employed and properly tooled and laid. But all this is now changed. The stonework is done by a contractor who may not live or work in the locality, all turned out by machinery and transported to the building, and often the specified stone—say Portland—is mixed with stones of inferior quality. The labour on the masonry is reduced to a dead-level by machine tools. It is often of poor quality, as in that which comes from the planing and moulding machines, the surface being often soft and pulverised when new and wet stone is used. The result of this machine-worked material is to overwork the stone with mouldings and enrichments. Under the old régime the surface was treated intelligently by the mason's chisel; by men who knew the stone and who cut and worked it to suit its position in the building. Whereas in the London builder's yard all kinds of stone—Bath, Caen, York, Portland, marbles, and granites are worked by the same mason in turns. So it comes about that we lose all character in stonework. Again, terracotta-work competes much with mason's work, and has led to the use of all labour-saving appliances, as well as to imitation of stone.

The mechanical agencies used to lift heavy blocks of stone have also operated to bring about a certain character of uniformity in buildings, irrespective of locality. What was once impossible, except by a large expenditure of labour in working a lever or a handle, is now performed with ease by cranes erected on staging that can be employed to lift tremendous blocks of stone or heavy iron girders, and swing them to their desired position. By the aid of cranes, overhead staging, and travellers, tons of masonry can be handled with comparative ease, so that huge monoliths can be erected as easily in London or the South of England, as they can be in the North. We have only to consider how much more work can be done by mechanical means than by manual labour.

A man turning a winch handle can produce work estimated at about 25lb. exerted through a given space; say it is 220ft. per minute, then the useful effort may be estimated at 5,500 foot-pounds of work per minute while he can turn the handle. These mechanical agencies have, therefore, by cheapening the labour of building, induced a general uniformity in the methods of construction, and have so far eliminated those local peculiarities and traditions of design which have been valued by the artist.

But there are other ways by which we have been verging towards a dull uniformity, and all the beauty and temper and sincerity of the old buildings have left us. The habits of people have changed our buildings. Once upon a time there was a sincerity in building; heart and human handiwork were knit together in the planning of every room—in the design of masonry, brickwork, and woodwork. One reason for this change is the imported materials brought about by our increased facilities of transport. The architecture of the past was attuned to the site; the old church and manor-house seemed naturally to grow out of their surroundings; the "key-note" of the building and its design was set by the local formation, its stone or its clay. But when the old order gave place to the new of railways and electricity, the dweller in a stone district thought he would like to build his house in brick which he had seen somewhere in the eastern or southern counties; the expense of transport of brick was comparatively small, and so he indulged himself in the brick or half-timbered construction which had taken his fancy. This taste, to have something new or different to the old, spread till we find in many Yorkshire and West-country towns, as in Bath, where stone is plentiful and cheap, brick buildings of the latest phase. In a few more years this levelling of buildings, of new mixed with old methods and styles, will go on increasing till it will become difficult to discover any of those pleasing local varieties of styles which once rewarded the eye of the tourist. And with materials other conditions have changed also. We see the ordinary cockney house or suburban villa plan adopted in districts and on sites where a totally different arrangement is called for. The plan is stereotyped without reference to approach, to aspect, or scenery. The great modern hotel of several stories, like the Railway Hotel in Lime-street, Liverpool, may be a replica more or less of a London hotel, and, of course, other hotels and buildings soon spring up emulating the latest style and the same employment of materials. Extremes meet also. The most ornamental French Renaissance may be seen in the great Lancashire seaport as in the Exchange Flags—a building almost Louvre-like in style, and in business premises in Castle-street; on the other hand, Attic regularity and reserve may be seen in Elmes' great Hall and in Picton's Art Gallery. So the effect of intercommunication and mechanical agencies is to distribute in our great centres all materials and methods, to level down local characteristics. Against this levelling process, the architect is to a large degree helpless to do much. He can, however, assist in preserving distinctions which depend on material and other developments of style as the natural expression of character.

STRESSES IN MASONRY ARCHES.

A GREAT deal has been written on the mathematical theory of arches of masonry, and much speculative inquiry has been evoked ever since Newton's time. Among the great writers on the subject may be mentioned Coulomb, Navier, Lamé, Hutton, Moseley, Rankine, and several others. Two theories have been enunciated—the statical theory, according to which the com-

ponent stones or voussoirs are held together by the force of gravity, held in equilibrium by the resistance of the materials, which are supposed to be rigid and incompressible; and the elastic theory, according to which the materials are regarded as more or less compressive or elastic, as in the case of metallic structures of the arched form. Many instructive treatises and papers have been written on the elastic resistance. The statical theory still holds good in massive arches of moderate span, where the statical load is in excess of the moving load, but in bridge arches the elastic theory is more applicable. Here the curved line or catenary principle is brought into notice, this curve accommodating itself to every position of the load. Our readers are no doubt acquainted with this theory in principle, the peculiarity of which is that the highest point of the curve is directly under the load, and as the load advances, as on a bridge arch, the stones rearrange themselves to a new curve. Readers of Hutton's and Ware's treatises will remember diagrams showing the rearrangement of the curve under different loads. Under a symmetrically disposed load the curve of equilibrium is regular and easily found; but in arches or bridges exposed to loads which vary in position and amount, the problem is more complicated. A writer in the *Engineering Magazine*, Mr. Henry Harrison Supplee, has given a brief résumé of the subject on the "Strength and Failure of Masonry Arches," and he considers the question in its practical bearings. In the first part of his paper he deals with the elementary principle of the catenary curve or chain. When this natural or self-sustaining chain is inverted, the curve is that assumed in a "similar arch under the same loads, all the directions being reversed, and all the tensions converted into thrusts." This is well known to every student of mechanics, and the way the curve theory can be applied to arches with voussoirs made with curved faces so that they easily move on one another under varying loads, is illustrated by diagrams given by Professor Fleeming Jenkin in his article on "Bridges" in the *Encyc. Britannica*. Taking a model arch with curved faced voussoirs, he loads it in different ways. When the load is in the centre the crown of arch is depressed; when two weights are placed one on each side over the haunches they become depressed, and in like manner a load on one haunch causes a distortion. In each case a line drawn through the points of contact of the curved faces of the voussoirs gives us the curve of equilibrium of the weighted arch, and these curves assume different forms in each, the curve "humping" itself up to meet the load. In a real arch with the bed-joints plane, the same pressures exist, and the stones suffer compression along the curve line, though they cannot rotate as in the former case. In practice, in fact, a slight distortion of the arch takes place, "and restores its equilibrium when the stone has a high modulus of elasticity." On the static theory, when the line of pressure approaches the outer curve of arch, "rotation" is supposed to take place at the joint of the arch opening below; but the resistance of the stones was that of crushing strength, elasticity not being taken into account. Considering the question how far the elastic theory is applicable to arches of masonry, Mr. Supplee gives a few of the results determined by the Austrian Society of Engineers and Architects, relating to full-sized arches of various materials under certain stresses. The report of the experts appointed is to be found in the journal of that society, and is of much value to all interested in bridge building. We may briefly refer to these tests. Four arches of 73.4ft. span (23 mètres) and 15.1ft. rise and 6.56ft. width, three of which were of rubble, brick, and concrete, and the other was of concrete in which a network of round iron rods was imbedded

to resist tensile stresses, known as the Monier construction. These experimental arches were constructed on the Western Railway, near Vienna, and are shown by photographs in the paper we refer to. In these arches the equilibrium curve or line of pressure for uniform loading is found practically in the middle of the arch ring. One half of the arch was loaded gradually, the deflections along the curve being carefully taken, and any cracks that might appear were particularly noted. The loads were applied at equidistant points on steps—a form of loading which is precisely that in actual bridge arches. The methods employed to measure the deformations are given in the report, but we simply give the results as recorded by Mr. Supplee. Taking the rubble-stone arch, the depth at key was 23.6in., and at the springings 43.3in., the load being placed at six equal distances from crown to the springing. The author says: "As the loads were applied the deflections increased almost in direct proportion to the force applied, showing that the laws of elasticity held good for masonry as well as for metallic structures, while after the elastic limit was surpassed and cracks began to form, both the location of the cracks and the point of maximum deformation showed that the position of the equilibrium curve practically coincided with that demanded by the elastic theory." The cracks appeared when the one-sided load reached about 500lb. per square foot, and in most cases they occurred at places furthest from the distorted line of pressure, or the part under greatest tension, or the intrados on the loaded side and at the extrados on the unloaded side. At these points the arch failed when a load of 660lb. per square foot was applied. Similar results were found in the other arches, the differences being only those due to material. The conclusions derived from these tests establish the fact that, within certain limits, the law of elasticity is the same for all arches, whether of masonry, concrete, or metal. These experiments have shown the possibility of building up from the extrados of the solid arch vertical piers at intervals, as in the case of a metallic construction, each pier being located as in the distributed loads of the test arches. The effect is an artistic structure with pierced spandrels, and a series of small arches under the roadway.

On the principles described, a great stone arch has been constructed over the Pruth at Jaremeze, with a span of 213ft., and a rise of 58.6ft.—a span only exceeded by the Cabin John Arch near Washington. The Jaremeze arch was designed by Inspector Huss, the load being distributed in the manner followed in the test arches, and no doubt other great railway arches will be erected on similar lines.

BATHS AND WASHHOUSE COMPETITION, BETHNAL GREEN.

THE Vestry of St. Matthew, Bethnal Green, have selected two designs for the intended baths and washhouses. The assessor whose decision has been adopted was the late Mr. Shoppee, whose sudden death we record, and this was one of the last cases in which he was engaged. The memorandum prepared by the surveyor, Mr. F. W. Barratt, has set forth all the particulars and estimates as to the seven sets of designs exhibited at the Vestry Hall. The plan of site is a rectangle, bounded by three streets, 131ft. 9in. long by about 64ft. deep, north to south. The author of the design "Savon" (Mr. R. S. Ayling, A.R.I.B.A.) has been awarded the first premium, and the author of design "Red Cross" (Mr. E. Harnor, A.R.I.B.A.) the second. There can be little question as to the wisdom of the choice in this instance. "Savon" has a compact arrangement of baths and entrances, and these are well lighted and ventilated—very important points. The ground-floor plan shows ten first-class baths for men and 20 second-class baths with a waiting-hall in a central position; also five women's first-class baths and 11 second-class and waiting-

hall, each class being well separated, with a central pay-office between the two entrances. These entrances occupy the centre of the Cheshire-street front, are well lighted by an area in the centre of site taken out of the men's first-class baths. The washhouse, 48ft. by 40ft., occupies the corner of site between Cheshire and Abbey-streets, and is arranged for 40 persons, and has four hydro-extractors and closets. The author has taken advantage of the levels, the highest corner in Abbey-street being utilised for an entrance to washhouse, which can be used for storing perambulators, and is 8ft. 6in. wide. It is well lighted by skylights. The washhouse is not only lighted at sides, but has central skylights. The waiting-rooms, 14ft. by 12ft. each, are also well lighted, and no borrowed lights are shown. Other good points in this plan are the separate entrances to board-room and superintendent's office—these are on the ground floor, shut off from the baths, and the superintendent's private rooms are above, on the first floor at the corner of main front and Ramsey-street, well lighted and compact; careful study of the establishment laundry in the basement, linen-lift, dynamo and engine-house, workshops and stores, a subway for under gearing of hydros—all these offices being well lighted, and with well-ventilated water-closets opening into area. Instead of being in one heavy tank, the water is distributed in four separate tanks. The external treatment is in a plain, sensible style, of deep-toned bricks, with a basement of stone or terracotta—the latter material would be the most desirable for wear and cleanliness. The entrances are effectively emphasised by dressings of this material. The total estimated cost is, in terracotta and glazed bricks, £11,910; if in Portland stone, £600 extra. An alternative scheme shows the women's baths placed on first floor.

"Red Cross" has a carefully-prepared plan, but is less economical, and its lighting arrangements not so good. The plans show the whole area covered. The baths for men and women occupy the north-western area of the site, while the laundry for 40 is placed at the Ramsey-street end, and with an entrance in front next the women's-baths entrance—not very good arrangement. There are two pay-offices in front: one between men's first and second classes, and one for the other sex. The waiting-rooms are small, and are apparently not directly lighted. No space for perambulators is shown; the closets also are in dark, ill-ventilated corners, which would not pass the requirements of the L.C.C. In the basement the closets are also generally inside, and the windows of mess-rooms are placed too much in the corner. The board-room and superintendent's house occupies two floors above the ground level, and is arranged as a centre over the entrances. The elevations are plain, in good keeping, all in red brick, and the cost is put at £15,946. We notice that the area lighting the laundry in Ramsey-street is rather narrow; also the large tank to hold 10,000 gallons on roof at this end is carried on iron columns and stanchions over drying closets, a scarcely secure mode of construction. In other respects the design carries out the requirements. An alternative design B is sent in. We cannot speak of the other designs, which are scarcely in the running with these two. "Simplicity with Utility" is one of the best; but the closets are not well ventilated, and arrangement of laundry out of the way. "Sweetness and Light" scarcely realises its motto, as there is very little lighting on the principal floors, and the superintendent rooms are distributed on three floors. The entrance is from low-level, the corridor to washhouse is dark, and the entrances to baths cramped. "Expectus" also shows defective arrangement and lighting. The entrance from Abbey-street to washhouse at the other end is long and ill-lighted, and the area at this end is dark and very narrow.

SURBITON MUNICIPAL OFFICES COMPETITION.

IN the Gables Theatre at Surbiton the whole 26 sets of designs for the proposed Municipal Buildings for this urban district have been on view. The three recommended by Mr. Mountford, the assessor, appear to possess many merits, and, on the whole, fulfil the conditions of the competition. We are not concerned here with the local reasons of the council for waiving the assessor's choice, which has dissatisfied some of the competitors; but there are certain reasons for preferring the plan, at least, of the

design No. 25, which has been accepted by the council. Design No. 11, by Messrs. Wimperis and East, recommended by the assessor, is externally simple and bold in character. A single-span green slate roof, broken by dormers and chimneys, covers the main building, which is of red brick and freestone dressings; but the south end is emphasised by a circular gable or pediment, which gives character to the elevation, and expresses the council-chamber externally. The entrance part of façade facing the Ewell-road is slightly set back, and Ionic columns carry the entablature of the roof; the windows are plain sashes, with some little carving below the centre light of council chamber. This detail is shown on a large scale drawing. The plan is less satisfactory. A wide central corridor, not well lighted at ends, through the centre of main block gives access to the two main departments. The clerks' public and private offices, and the registrar's and collectors' offices are at the south end—and these form a projecting wing below the council chamber, and are convenient to entrance. At the other end of corridor the surveyor has similar offices, with a lobby between them, and the medical and sanitary offices are next to the entrance in front. The council chamber on first floor is 42ft. by 30ft. 3in., and is approached by a staircase opposite entrance, with two committee and waiting-rooms adjoining. The entrance and corridor appear the weakest part of the plan; the hall staircase is narrow. The caretaker is located in the roof, and has a separate entrance in Berryland-road. The total cost is estimated at £5,004, cubed at 9d. per foot.

The "selected" design, by Messrs. Forsyth and Maule, Great Marlborough-street, is compact in plan and symmetrically disposed. The central block is about square, and is carried to a greater height than the side wings, and has a high hipped roof with fleche. A centre entrance from Ewell-road gives access to the collector's department on the left and the public clerks' office on the right; each is 21ft. by 15ft., and has a safe. The transverse corridor right and left, with main staircase in front of the entrance, leads on one side to the council clerk's private office, to the sanitary and medical department, 16ft. by 15ft., and the registrar's office. On the corresponding wing to the left are the surveyor's offices, well lighted by north light, easily approached, with waiting-room between. Between them and the main staircase is the caretaker's entrance and stairs, and in the rear is an isolated lavatory and closet block. The council chamber, lighted in front and sides, is 40ft. by 29ft. 3in., and placed over entrance and offices, and has a semicircular arrangement of seats with space all round. It has a ventilator by a trunk in roof connected to the extractor and fleche, and has two end fireplaces. The committee-rooms are conveniently placed in the projecting wings over the waiting and the sanitary and medical department. The principal stairs make a handsome access to a landing with lobbies to the chamber, and the waiting-room for deputations is well located. The conveniences are also cut off at the back behind main stairs. The second floor in roof is reserved for the caretaker's apartments. The design is rather commonplace and of a domestic type, with high roof and low-roofed wings. The building is cubed at 7d. per foot, and is estimated at about £5,000. The plans and details of the plan are carefully studied.

The design of Messrs. Hewitt and Ryan-Tenison (second premium) has many good features. The external treatment is of the old English manor-house character, and makes a somewhat long and broken but dignified façade, with mullioned and dormer windows, centre fleche over the board-room, which is over the north wing, and which breaks forward from the central part. There is a quiet breadth in the treatment. A longitudinal corridor 8ft. wide runs down the centre, lighted at each end, with the main entrance in the centre of the façade. Opposite the entrance is a commodious staircase to the council room, with conveniences behind. On the south end of corridor, the council clerks' private and public offices are placed, well approached and lighted; these are in front, behind them are the collecting and registration department. The surveyor's offices, well lighted on two sides, occupy the wing on the north end of corridor, with waiting-room, and are near the entrance. Behind are the medical and sanitary offices. The council-chamber, 40ft. 6in. by 26ft. 3in., is placed in the northern

wing over the sanitary, medical, and surveyor's block, and is lighted at ends and sides, with committee-rooms in front. There is a library for members, and the caretaker's rooms are over, in the roof, lighted by dormers. There is a good ink-wash perspective.

Other designs include many well-executed, but too costly, buildings. Mr. Henry A. Cheers, of Twickenham, sends a cleverly-drawn and mounted set of drawings in line, shaded in a Free Renaissance style; the council chamber on upper floor is on the right-hand side, lighted by end windows and by side lights over the dado. The detail of entrance is clever, but does not harmonise with upper story. Messrs. Harrington and Ley show a rather florid design with corner turrets. The council-room is on first floor at south end, with entrance under. A few others have put themselves out of court by extravagant façades. No. 14 is a pretentious-looking design in two blocks, one facing the Berryland-road. No. 14 has a large square hall in centre, lantern over the offices being grouped round, the council chamber in rear. No. 16 is a balanced plan, with turreted square angles, and a wide gable to front; 17 has a central hall on upper floor, but is too ambitious. No. 18 resembles a large villa, with rounded corner to the two roads. No. 23 has some good points, but is too costly in style.

MUNICIPAL AND COUNTY ENGINEERS AT SUNDERLAND.

A NORTHERN DISTRICT meeting, in connection with the Incorporated Association of Municipal and County Engineers, was held on Saturday at Sunderland, when papers were read and visits paid to places of interest to the members within the borough. Amongst those present were:—Messrs. C. H. W. Biggs, London; S. T. Carr, Grange-town; J. E. Tiffin, West Hartlepool; Cuthbert Brown, Bedlington; Geo. R. Fraser, W. Kirkley, Ripon; T. B. Mather, Heaton, Newcastle; Frank Baker, Middlesbrough; H. F. Campbell, Stockton; John Cooper, Edinburgh; Thos. Cole (secretary), London; John P. Dalton (hon. district secretary), Ryton; T. W. Stainthorpe, Eton; J. W. Brown, West Hartlepool; H. F. Crumack, West Hartlepool; Thos. H. Tarbitt, Loftus-in-Cleveland; H. W. Taylor, Newburn; W. Edson, Ripon; B. F. Smellie, Tynemouth; W. G. Bent, York; Geo. Hollings, Wallsend; J. P. Spencer, North Shields; R. S. Routhwaite, Sunderland; F. J. C. Snell, Sunderland; W. P. Pattison, Benwell; and C. J. Baff, Gosforth.

The members were received in the Council Chamber of the Town Hall by the Mayor (Alderman W. Bruce), who welcomed them to Sunderland.

Mr. John Cooper (Edinburgh) then took the chair.

TYNESIDE ROADS.

Mr. H. W. Taylor, A.M.Inst.C.E., Newburn-on-Tyne, read a paper entitled "Notes on the Specifications of Tyneside Roads." He said that the foundation of a macadamised road necessarily depended in great measure on local circumstances. The local sandstone or freestone was very generally used on Tyneside, and an excellent material it was. Continuing, the author said: In the construction of roads on building estates, what is known as "random chip paving" is frequently employed. It is a cheap or bastard kind of sett paving, composed of irregular or random lumps of whin-stone or granite, averaging 5in. to 7in. deep. Random chip paving is a somewhat questionable success, inasmuch as the chips are not uniformly shaped, the beds must vary, and with average traffic the road loses its shape, and hollows and depressions are formed. It is frequently used in back streets, although it has a multitude of joints in which refuse and fecal matter are bound to lodge in a district where middens and ashpits are in vogue. It is an exceptionally noisy pavement when a little worn, its one advantage being that it costs but little to scavenge and maintain compared with ordinary macadam. Tarred macadam is not used to the extent it perhaps deserves; it is clean and impervious, and, as it can be washed with ease, it is an unrivalled cheap paving for back streets in a midden town or district. Considerable skill and manipulation are required in properly mixing and laying tarred macadam, and there is no doubt that it has got into disrepute through inattention or neglect of these matters. The stone must be thoroughly dry

before coating it with the tar. Tar from a gas-works where a regenerative heat is used in almost worthless. On sanitary grounds tarred macadam is preferable to the usual random chip paving with its multitude of joints. It has the disadvantage of being somewhat difficult of repair. Of all road metals, the most local, universally used, and generally favoured is the famous Northumberland whin-stone. It is hard and durable, its wearing properties being of the first order. Aberdeen (from whence nearly all our granite macadam is obtained) Cove granite is well spoken of; it may not, perhaps, stand quite so heavy a traffic as whin-stone, but it bears an ordinary traffic well. It makes a smooth road, and has the great advantage of not working loose in dry weather. The hard blue mountain limestone, such as is obtained from Alston, is very suitable for inclines (or "banks") and roads of a rural character. It should be thoroughly steam-rolled as soon as it is laid, with a roller preferably not exceeding 10 or 12 tons in weight. It is sometimes objected that limestone is muddy in wet weather, and under heavy traffic this is undoubtedly so, but with light and medium traffic it is an excellent stone. It makes a smooth road, one much appreciated by cyclists, and when once rolled in it lies splendidly, even in the driest summer weather. The general consensus of opinion of iron-stone slag as a road metal is that it is worthless, and does not pay for the labour of laying on. As it is now produced it is full of honeycomb, and quite undesirable. In some of the outlying roads, where the traffic is light, it is still used as a metalling, but the practice is gradually ceasing. As a foundation it is admissible, but is not equal to freestone, as it has little or no "jamming" property, and cracks and crushes beneath the roller.

HOUSING OF THE WORKING CLASSES.

Mr. R. S. Routhwaite, Assoc.M.Inst.C.E., read a paper, in which he dealt with the housing of the working classes, the proposed technical school in the borough, and a new hospital pavilion. He said the adoption of the 1890 Act, having reference to the housing of the working classes, had in Sunderland received the careful attention of the council and of the health committee. A large number of insanitary areas in the older part of the town were in 1892 inspected and reported on by the then medical officer of health (Dr. A. E. Harris, of Islington) and himself, and the health committee confined their attention in the first instance to one of the worst districts in the town—namely, the "Hat Case area," which comprises, in streets, courts, alleys, land, and buildings, only about two acres, of which 2,404 yards or thereabouts are intended to be used for the erection of workmen's dwellings, the remainder being thrown into adjoining streets and utilised for new streets. Allowing two persons to each room of the 480 persons unhoused, provision will be made for 454, and the rentals from the erection of these workmen's buildings will make a gross revenue of £978 18s. 6d. per annum, whilst the outgoings are estimated at £332 16s. 6d., leaving a net annual income of £646 1s. 6d., which is sufficient to cover the interest and sinking fund on the total estimated cost of the scheme (£16,402). Respecting the proposed technical school for the town, the whole of the funds necessary for the erection and equipment of such have not yet been obtained. The probable cost of the whole scheme will be about £20,000; and of this sum about one-half remains to be provided. The council have purchased a most eligible and central site. With regard to the new pavilion in connection with the Sunderland Fever Hospital, it had been found necessary to increase the accommodation for patients. The new pavilion would be, like the others, one story in height, and would contain two large wards for male and female patients. Each patient would have a floor space of 156 superficial feet and an air space equal to 2,028c.ft., which was slightly more than was required by the Local Government Board.

SUNDERLAND ELECTRIC LIGHTING.

Mr. J. C. Snell, borough electric engineer, read a paper on this subject, in the course of which he said:—A system of arc lighting in the principal public streets is about to be inaugurated. The contract for lamps has been let to Crompton and Co., of Chelmsford, and these will burn four in series across the outers of the low-tension three-wire system. The poles are being supplied by J. Spencer, of Wednesbury, and are of steel in two sections, the upper section tapering, and the

poles being set in ornamental cast-iron bases. The reason for the adoption of steel poles is their possible requirement for the support of overhead wires for electrical traction. The lamps will be suspended from swan necks at a height of 21ft from the ground, and will be placed about 60 yards apart. Sunderland supplies current to its consumers at the cheapest rate in the three kingdoms (whether municipal or private company), the average price paid per unit during last year having been only 4.09d., and the next lowest having been Newcastle at 4.14d. A most gratifying increase in the motors connected to the mains has been obtained. In March, 1895, only 29½ H.P. was connected; at the present time we have 291½ H.P. These motors are used for various purposes, such as for lifts and hoists, chaff-cutting and corn crushing, printing presses, for driving workshop tools, pumping, and even for revolving hair-brushes. The demand is increasing so rapidly that extra boilers and steam dynamos will be again required for next year.

VISIT TO THE PIERS AND DOCKS.

The members afterwards proceeded by tram to Roker Pier Works, which they inspected, and then crossed the river to the South Docks, where they viewed the installations of gas-driven pumping machinery at the graving docks, and then proceeded to the South Pier works and inspected the concrete and block making plant, and other objects of interest. The members were conducted over these works by Mr. H. H. Wake, M.Inst.C.E., engineer to the River Wear Commission. They next drove to the electric generating station, which was described by Mr. Snell, and then inspected the Corporation Swimming and Slipper Baths, and the Washhouses in High-street West. The members returned to the town-hall about five o'clock, where a short discussion on the papers which had been read took place.

PASSMORE EDWARDS PUBLIC LIBRARY, EDMONTON.

ON Saturday last, Dr. Richard Garnett, C.B., Keeper of the Printed Books at the British Museum, opened the new public library erected in Lower Fore-street, Edmonton, at a cost of about £4,000, exclusive of the site, and including the oak and pitch-pine fittings. Mr. Passmore Edwards gave £3,000 towards the total cost. Mrs. Humphry Ward laid the foundation stone in April last. The building is dedicated to the memory of Charles Lamb and John Keats. We illustrated the library in the BUILDING NEWS for April 9 last, with plans, view, and details. The builder is Mr. Arthur Porter, of Tottenham; Messrs. Hart, Son, Peard, and Co. have supplied the gas-fittings and art-metal work; Messrs. Strode and Co. the heating apparatus. The fire-proof staircase is by Messrs. Wilkinson and Co.; the carvings and marble tablet are by Mr. Nathaniel Hitch. The clerk of works is Mr. Jno. C. Lait. The fittings are being executed by Messrs. Adamson and Sons. Mr. Maurice B. Adams, F.R.I.B.A., is the architect.

Dr. Garnett's address dealt clearly with the value of free libraries in supplying the greatest need of the age. He pointed out that, just as monasteries afforded homes of learning in their day, and as colleges and grammar schools crept into existence to supply educational needs when monasteries appeared to have fulfilled their useful mission, so mechanics' institutes and free libraries in our time had come to meet the demands of the age for sources of education such as schools and other institutions were not capable of giving and not intended to supply. Then again—and thus helping to complete his interesting historic analogy—the veteran bookman made reference to the fact that, just as monasteries and grammar-schools were mainly the outcome of private benevolence, built and endowed by earnest men of learning to meet needs that were keenly felt, so nowadays the free library movement—truly a people's movement, and one meeting the inarticulate and unaided yearnings of the poorer people of England—owed most of its success to men like Mr. Passmore Edwards, who realised the needs of the age and devoted their best energies to the satisfaction of them. There was now, much more than at any time in the nation's history, a great need for education as to the duties of citizenship. Every part of the world was now virtually next door to every other part; and unless we acquired a greater knowledge than our ancestors concerning other lands and other peoples, we should suffer disagreeable

consequences as a nation, involving loss of life, unnecessary suffering, loss of trade, and neglected opportunities of advancement. The people, whose power in the end directed the affairs of the State, must be better informed on all questions, in order to give a wholesome direction to the policies of our statesmen, for those who stood in ignorance and needed learning were too often more painfully and intimately affected than those who had possession of the necessary knowledge. This work could only be done effectively to-day by free libraries, giving to the people great books, which tended to enlarge and humanise the minds and develop harmony instead of chaos. There were, further, our great commercial interests depending in a large measure upon a knowledge which could not be gained at school, which had to be secured by miscellaneous and well-directed reading. The greatest obstacle to British trade was ignorance. This, existing in many forms, and the unfortunate arrogance that accompanied it, must be got rid of in order to secure real progress. Then, finally, among the many other useful ends served by free libraries, there was the possibility of some boy or girl, unconscious of his or her genius, being awakened by the reading of useful books to a realisation of his own peculiar fitness for some branch of learning, and thus ultimately giving to the world the value of thought and services which might otherwise be unknown.

Mr. Edwards, in responding to a vote of thanks, said that in addition to the need of free libraries there was another and a very pressing want that ought to be met. The working-class people of Edmonton—90 per cent. of the population—for whom the new library was built, wanted more time in which to use the library. How could men have much time for reading if three hours were spent in going to and coming from their work in various parts of London, and they were obliged to work every day for nine hours? He was not there to advocate any policy or to represent any party; but he saw clearly that we could not reasonably expect public libraries to be turned to the very best account unless the people for whom they were erected had fair opportunities of using them. Finally, he wished their educational work in Edmonton the best success, and hoped to hear in days to come that they were prospering.

The party then adjourned from the Town Hall, where the public meeting was held, to the new Library, headed by a band and a procession consisting of members of the local fire-brigade, friendly societies, and trade unions, and Dr. Garnett, after opening the porch gates with a silver key, declared the building open for the perpetual use and enjoyment of the people of Edmonton.

WINDOWS BY LEWIS F. DAY.*

MR. LEWIS F. DAY is so capable and practical a writer, and so artistic and experienced a designer, that we are prepared for a high standard of excellence when he places any fresh work before us for notice. His latest production of a literary character is a charmingly got-up volume, entitled "Windows: a Book about Stained and Painted Glass," fully illustrated, and really beautifully printed, while the neatness of the binding well befits so artistic a work. Mr. Batsford has evidently spared no pains in co-operating with the author in publishing a book worthy of their united reputations. The reader must recognise these qualities, which go far in favourably introducing the treatise which is so tersely inscribed by Mr. Day in the following terms: "To those who know nothing of stained glass; to those who know something and want to know more; to those who know all about it, and yet care to know what another may have to say upon the subject—I dedicate this book." All concerned in its enjoyment are thus put on good terms with themselves, while the critic, no longer described as the "gentle reader," as he invariably used to be, can scarcely ignore the genial influence of so good-humoured an author who disarms criticism, at least to some extent, by frankly acknowledging that he has no claim to learnedness in this matter. Apart from the pleasure afforded by the study of glass for windows he evinces but a modified concern, leaving to others—such as Winston and Westlake—the erudite task of precise historical information. The author's aim has been to write as a workman addressing workers, setting out with the idea of tracing the course of *workmanship*, and to follow

* Windows: a Book about Stained and Painted Glass. By Lewis F. Day. London: Batsford. 21s. net.

the technique of the craftsman in glass from the 12th to the 17th century, and then to show the development of *design*, concluding with a chapter on *style*, this latter being introduced mainly for the use of those who are in want of *data*, by which to form some correct opinion as to the period of a window when they see it. This is an attractive programme; but it has in the making-up of the book the appearance of going over the same ground two or three times, making it by no means always easy for the less attentive reader to follow exactly where the individual point intended to be emphasised comes in distinctively from much else which could be said on the same illustrated example. All the drawings are in black and white, and we quite agree with Mr. Day's observations as to the worthlessness of representations of glass printed in colours. Mr. T. M. Rooke and Mr. John R. Clayton have lent some charming drawings of windows, which much enhance the value of the author's series of more than 250 illustrations. The tints on the heraldic plan are indicated by the method of hatching adopted in the cuts.

The beginnings of glass need not occupy our brief space, and we know that so long ago as 2,300 years B.C. the Chinese are said to have made white glass of great purity. The Egyptians made jewels of glass, and the Greeks and Romans worked glass in imitation of precious marbles. The records of the Early Christians describe stained-glass windows, and church inventories as time went on soon make frequent reference to such things; but the greater part of the Early Gothic glass still preserved to us scarcely ever contains specimens belonging to an earlier time than the date of the 13th century, such, for instance, as our English examples at Canterbury, Salisbury, and Lincoln.

Speaking literally, "stained" glass and "painted" glass are two distinct things. Mr. Day thus defines them: "Stained glass is glass which is coloured, as the phrase goes, 'in the pot'—that is to say, there is mixed with the molten white glass a metallic oxide which stains it green, yellow, blue, purple, and so on, as the case may be—for which reason this self-tinted glass is called 'pot metal.' Once for all, 'pot metal' is glass in which the colour is in the glass, and not painted upon it." "In painted glass, on the other hand, the colour is not in the glass but upon it, more or less firmly attached to it by the action of the fire. A metallic colour which has some affinity with glass, or which is ground up with finely-powdered glass, is used as a pigment, precisely as ceramic colours are used in pottery painting. The painted glass is then put into a kiln and heated to the temperature at which it is on the point of melting, whilst the colour actually does melt into it. By this means it is possible to paint a coloured picture upon a single sheet of glass, as has been proved at Sévres. Strictly speaking, then, stained and painted glass are the very opposite one to the other; but, in practice, the two processes of glazing and painting were never kept apart; the difference between the Early and Late work being that at first the painting was only used to help out the stained glass, and in the later the stained glass is introduced to help out the painting. Slight as the difference may seem it made a vast difference, and, being intentional on the part of the designer, so correspondingly did it influence his design. Mr. Day graphically describes the mosaic windows of Early times, and the method of mapping out a window and the art of glazing in leadwork. Oriental lattices and Arab plaster glazings are described and illustrated with sketches showing developments of the craft. As a capital example of line-design, in which the composition is formed entirely by the lead, is given by the drawing of plain glazing from Bonlieu, which we reproduce (Fig. 1). The lines are all in lead, but it is interesting to remark that some of them are mere dummies, strips of metal holding nothing, carried across the face of the glass only, and soldered on to the more business-like leads at each end. The bottom right-hand corner of the drawing shows the *bona fide* glazing. The cutting of the glass in the 12th century, the date assigned to this example by Viollet-le-Duc, was exceedingly difficult, and so was shirked. Mr. Day notices other specimens of the same subterfuge employed at Rheims and Châlons.

The scheming of lead-glazing affords endless varieties, and then comes in the question of strength in the network of leads. The early use of paint and the comparative methods of early mosaic windows supply much that is eminently

FIG. 1.—Plain Lead Glazing from Bonlieu.

FIG. 2.—Fourteenth Century German Work.

FIG. 3.—Cologne Cathedral.

interesting, for, quite apart from the halo of sentiment about the earliest work, and apart from its picturesqueness, much of which is due to age and accident, there is almost always an evident knowledge and feeling for the material, and a sense of treatment seldom found in what we may term accomplished modern glass-painters' work.

Shaded glass painting, diapers and abrasion and painting out, all obtain a reference, with much information, which is impossible to condense, and so we go on, only being able to thus briefly indicate the thoroughness of Mr. Day's research, which must have taken him years to accomplish.

The Middle Gothic glass was much influenced by what the author terms a wave of realism, and thus a naturalistic form of ornament occurs in what is known as the Decorated period, and, whatever its merits, a departure was thus established in carvings, metalwork, and painting decorations. The grisaille glass of this date was systematically indicated by painted outlines, and not glazed with lead lines if it could be avoided; 14th-century glaziers seldom complicated their quarry work by the introduction of strips of colour between the quarries. In Germany it was customary to use geometric patterns in diaper long after it had gone out in France. In these colour was of prime consequence, whereas in the Earlier diaper the glazier was more concerned with the pattern. Fig. 2 is a 14th-century German diaper of heraldic character from Nuremberg. The Fairford window may have been executed in England;

but, if so, German or Flemish artists had a hand in it, and in the nave windows of Cologne Cathedral German glass reaches its limit, a figure

FIG. 4.—Plain Glazing—Lisieux.

here given (Fig. 3), from one of which is thoroughly representative. Indications of Renaissance detail in the design are evident. This

leads Mr. Day to deal with 16th-century canopies and cartouches, as well as plain glazings splashed with jewels of colour sparingly, or enriched with heraldic centres. Fig. 4 is a charming pattern of plain lead-line glazing from Lisieux. Picture windows and the influence of mullions are considered with examples—landscape in glass, bull's-eye windows, tracery lights and rose windows, painted quarries, roundels; domestic and Italian glass, Netherlandish glass, Swiss and Dutch windows, all furnish subjects for much information. Then comes a chapter on style, another on how to see coloured glass, with some pages on mending properly. We have hardly done the volume justice: it is replete with examples, about which there is so much to be usefully said, and besides, the very plan of its arrangement prevents our making an epitome which may be considered quite satisfactory; but we have said more than enough to induce the reader of this brief review to make a more intimate acquaintance with what Mr. Day has to tell of his subject. His earliest training well befits him to write upon it, seeing that he was apprenticed in the workshop of an artist in stained glass.

THE SURVEYORS' INSTITUTION.

At the ordinary general meeting of the above society held at Savoy-street, W.C., on Monday last, a paper was read by Mr. J. D. Wallis on the compensation cases settled by the promoters of the Manchester Ship Canal, princi-

pally under the agency of his partner, the late Mr. A. M. Dunlop. Mr. Wallis gave, as was necessary to explain his subject, a long series of figures representing the land values, the compensations for disturbance and severance, and the other negotiations involved in a scheme of this nature. He mentioned incidentally that after unsuccessful applications to Parliament in 1883 and 1884, an Act was obtained in 1885, capital was raised in 1887, and during the latter year the first sod was cut, and the construction forthwith commenced. The canal was opened for traffic in 1894. Its length is $35\frac{1}{2}$ miles, the depth of water 26ft., the minimum bottom width 120ft., the average water-line width being 172ft. It follows generally the course of the rivers Irwell and Mersey from Manchester to Eastham, where it enters the channel of the Mersey, the rise of 60ft. between water-level at Eastham and water-level at Manchester Docks being maintained by five locks. The average width of land required for the water-way was from 200ft. to 300ft. for the $35\frac{1}{2}$ miles. In addition, a large area was required for docks, for the deposit of spoil, for deviation railways, for company's railways, new roads, river diversions, and for temporary purposes. The total excavation necessary amounted to about 50 million cubic yards, nearly the whole of which had to be placed on adjacent land, covering about 1,300 acres. The land cut off by converting the sinuosities of the rivers into the straight canal had to be dealt with. Much of it was used for the deposit of spoil, but many frontage claims had to be met. Five deviation railways, each extending $1\frac{1}{4}$ mile on each side of the canal, had to be constructed for the purpose of carrying the rails at a level of 75ft. above the canal. The Parliamentary estimate for the Bill of 1885 amounted, for land, compensation, interest, and expenses, to £1,100,000 for some 3,500 acres or about £320 per acre, credit being taken for the sale of 1,700 acres of surplus and spoil land. The actual gross expenditure under the above heads had been £1,359,490, or an average of £291 per acre. Alterations in the Bill during its passage through Parliament had necessitated the taking of some 1,200 acres more land, and it was therefore not possible to draw an exact comparison between the results obtained and the Parliamentary estimate; but the average cost was, as he had said, £291 per acre. Nearly 1,000 claims were sent in, amounting in the aggregate to some two-and-a-half millions, which were settled for as nearly as possible one half that amount. The total area purchased was 4,664 acres, and the total expenses of purchase were £1,359,490. The price paid after allowing for chief rents and exceptional properties worked out at about £172 per acre, the price varying from £97 per acre for agricultural land near Warrington to about £5,000 an acre for building land at Manchester. The author then proceeded to mention some detailed instances of prices paid in various localities. The agricultural distress of recent years had, he said, affected Lancashire and Cheshire less than some other localities, the rent paid by occupiers averaging some 40s. per acre, rising in some places to 60s. The severance caused by the canal was more serious than in most ordinary cases, owing to its great width, and many costly swing bridges had to be constructed to carry roads and waterways over it. The author proceeded to give some instances of compensations. In one case of an estate with a frontage to the Mersey £83,000 was claimed; the witnesses for the company allowed only some £20,000, and the award was £28,900, or £240 per acre. In another case of 180 acres the claimant's surveyors put the price at about £73,000, the company's surveyors at £25,000, and the arbitrator awarded £37,000, or £209 per acre. In Warrington township the average price was £250 per acre, in Latchford and Grappenhall £300 p.a., in Thelwall and Woolston £175 p.a., in Lymm £115 p.a., in Rixton from £110 to £200 p.a., in Partington £140 p.a., in Irlam from £150 for agricultural land to £600 for building land, in Flixton £150 p.a. In Barton-upon-Irwell the agreed price paid to Sir Humphrey de Trafford averaged £290 per acre, including park land, agricultural land, and land with a building value, and some allowance for severance. In Pendleton about 50 acres, with a frontage to the river Irwell, cost £400 p.a. The Mode Wheel Mills were purchased under award for £21,174. In Salford $56\frac{1}{2}$ acres was acquired under an arbitration for £63,240, or about £1,100 p.a. Five acres in Ordsall-lane, Salford, cost £11,143.

Land for the Manchester Docks, comprising some 21 acres, cost £70,000. In Manchester, £15,000 was paid for $1\frac{1}{2}$ acre of timber yard, with a saw-mill and machinery; and Mr. Wallis gave several other instances of land values on the line of the canal. The total number of contested cases was, he said, 32 out of 954 claims, and the amount awarded by arbitration or jury was £332,000, as compared with £881,000, the amount of the claims settled by agreement. As to arrangements for possession, the author said little difficulty had been experienced, but in some few cases it had been found necessary to apply to the Board of Trade to appoint a surveyor to make the valuation for deposit, which course was often a great help in arriving at a settlement. Mr. Wallis next gave tables showing the amounts of the valuations made for the purposes of the deposit and the prices afterwards paid, which figures in the majority of cases very nearly approximated each other, although in some cases two equally able and competent surveyors took very different views of the value of the same property. The average price per acre paid to agricultural tenants was £9 12s., the interest of a tenant from year to year extending to about eighteen months. The "Surplus Lands Act" of the company gave them some exceptional powers of dealing with such lands, which comprised an area of some 2,600 acres, and had been acquired for deposit of spoil, or upon counter notices from landowners, or to avoid severance claims, or for accommodation works. These lands were a valuable asset in the hands of the company, affording good sites for manufactories and warehouses. Land had already been disposed of for ship-repairing works, timber and coal wharfs, soap-works, cattle lairs, cold-meat stores, oil-tanks, and other purposes to the extent of some 127 acres. The land had originally a merely agricultural value; but the expenditure of 15 millions by the Canal Company had raised it to the value of building land, and there seemed little doubt that the banks of the new waterway would, in a few years, be lined with factories and warehouses, producing traffic and developing a trade which would pay a good return on the cost of the undertaking.

After some remarks by Mr. A. Vernon, Mr. D. Mathews, Mr. Lightfoot, Mr. H. Hendriks, and Mr. Warner, the vote of thanks to the author was put and carried unanimously, and the meeting adjourned.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—IX.

By AN ASSOC. INST. ELECT. ENGS.

ACCUMULATORS (continued).—DISTRIBUTION.

GENERAL REMARKS.—The requirements of a good secondary cell are large capacity, solidity, durability, efficiency, and cheapness. The only method of getting large storage capacity and the capability of giving heavy discharges is to expose considerable surface; thus, with the L-type of the E.P.S. cells, 30sq.in. of active surface on the positive plate is required per ampere, and, although this is somewhat excessive as compared with newer plates, it emphasises the fact that to render storage cells less widely and more compact, the positive and negative plates must be interwoven, as shown diagrammatically in Fig. 15.

As will be observed, the positive and negative plates are made up by connecting a number of small plates (called sections) in parallel so as to expose a large surface, and by taking one more negative section than positive it is clear that both sides of the positive plate are formed, and are effective in storing energy. Thus, the total superficial area of peroxidised surface—i.e., the areas of both sides of the positive plate—are countered to obtain the effective surface—is a measure of the amount of energy which can be stored. In other words, the capacity and discharge may be taken as being strictly proportional to the amount of active material involved. The capacity of a cell is usually given in ampere-hours; thus, a 15-plate (7 positive and 8 negative—there always being one more negative than positive) E.P.S. cell has a capacity of 330 ampere-hours, so that it may discharge 30 amperes for 11 hours, or 22 amperes for 15 hours, and so on. For convenience in indicating the polarity of a cell the lead bars connecting together the sections and called lugs are painted, the positive red and the negative black.

Since internal resistance diminishes the dis-

charge rate, it is reduced to a minimum by placing the plates as near together as possible, the usual distance between a positive and negative section varying from $\frac{3}{16}$ in. to $\frac{1}{4}$ in. In practice, this distance is found sufficient to allow the required quantity of acid being used, and also to permit the paste to fall to the bottom, should it become detached, and so prevent short-circuiting the plates. At this point we may also mention that the positive and negative plates are in all cases separated by using insulating combs, forks, or separators made of ebonite or celluloid.

The E.M.F. of a storage cell or accumulator depends entirely upon the combination of the material of the plates and the acid used, and with lead plates (as commonly used) the E.M.F. of one cell is from 2 to 2.5 volts, and with n cells connected in series, the E.M.F. of the battery is n times that of a single cell. By enclosing the plates in glass cells, facility of inspection is assured.

Working and Faults.—The character of the success of the working of accumulators corresponds very largely to the care and attention they receive. When abused they rapidly deteriorate, and give more or less trouble when working. Nothing is so conducive to good results as keeping the cells well charged, and nothing tends to spoil a cell as heavy and prolonged discharges. In fact, a rule which should never be broken is never to completely discharge a cell. The faults which attend the working of accumulators, particularly in isolated installations, are:—

1. Disintegration and loss of peroxide or active material.
2. Short-circuiting of plates.
3. Buckling of plates.
4. Sulphating.

As we have already indicated, many improvements have been effected in the manufacture and construction of storage cells, resulting in increased capacity and durability, so that the tendency of the above-mentioned faults to occur is diminished, unless the cells are abused. Thus, if the cells are left fully discharged, or even only partly discharged for a long time, there is a tendency produced to set up local action, especially in the positive plate between the peroxide pellets and the grid. This, of course, produces unequal action in different portions of the plate, and a shedding of the active material. Small pieces of the active material fall out, and if they do not fall to the bottom of the cell they may rest between two adjacent plates and so short-circuit and discharge the cell. To prevent short-circuiting the cell, should much disintegration take place, a space from 2in. to 3in. should be allowed between the bottom of the containing vessel and the plates. Furthermore, not only do the short-circuiting pieces of plate discharge the cell, but they also prevent that cell being properly charged and so receive its share of stored energy, in addition to which the quantity of active material is diminished, resulting in diminished capacity. Another result of the unequal action in different portions of the plates is to produce buckling or bending of the positive plate. We have already mentioned that during use the plates expand and contract, so that with unequal action we naturally get unequal expansion and contraction, and so the plate buckles, tending to permanently short-circuit the cell. It is also clear that when once a plate buckles, the distance between the opposite parts of the adjacent sections is changed, and therefore the internal resistance varies from point to point, and different parts of the plates take more current (during charging) and give out less current when charging. This action increases the tendency to unequal treatment at different points of the plates. A moment's consideration will suffice to show the advisability of building up a plate by means of a number of sections connected in parallel rather than by means of a single large one.

Frequent excessive discharge and the neglect of plates in the condition just mentioned diminishes the specific gravity of the acid, and a white deposit of lead sulphate is produced, especially on the positive plate. This lead sulphate is a bad conductor of electricity, so that the internal resistance of a cell in this condition (sulphated) is increased, and its capacity materially diminished. To remove the sulphate, extra care and continued overcharging must be employed. Nor must the cells be discharged at their normal rate until the sulphate is removed.

In all cases the makers of storage cells supply

instructions for working accumulators, and it is important that the instructions be strictly adhered to. The following notes are from those supplied by the E.P.S. Company, and will serve as a general outline for the management of storage batteries in use.

Solution.—The sulphuric acid must be perfectly free from impurities, such as arsenic, nitric or hydrochloric acid, and must be diluted with pure water to a specific gravity of 1.19. Brimstone acid (specific gravity 1.84) should be slowly poured into the water, and well stirred and cooled before taking the specific gravity. The proportions are about 21 gallons water to 4 gallons acid. The acid solution may be obtained from the makers ready for use, and it is important to remember that the acid should *not* be added until everything is ready for charging. The solution is added until it covers the negative plates fully half an inch.

First Charge.—The first charge commences immediately the cells have been filled with solution, and should continue until the solution of each cell has become milky, owing to gassing of both positive and negative plates, when the specific gravity should have risen to at least 1.195 or 1.2. This charge usually lasts about 30 hours, and on no account should the charge be stopped during the first twelve hours.

General Charging.—Partial charging and then exhausting the cells is bad; the charge should always continue until the acid turns milky. The cells should always be kept fully charged, and as soon as possible after a discharge they should be recharged. When the discharge has been excessive, it is better to recharge gently at first, and to gradually increase to the normal value. Should any cell not turn milky, it should be examined and cleaned, and then cut out of the circuit until it attains its normal condition. During charging the acid tends to evaporate, and any loss by evaporation should be made up by adding distilled water, and not acid. Evaporation may be minimised by using covers or spray arresters made of a non-conducting substance, such as glass.

Connections between the plates should be soldered or burnt. If not, they must be kept thoroughly clean, and all brass or copper connecting-pieces should be protected with vaseline or paraffin-oil.

When the cells are not required for a time, they should be charged at least once a fortnight, and on no account must the acid be removed. We have already remarked that the specific gravity of the solution increases with charging; it also decreases whilst discharging. In fact, the specific gravity of the solution indicates the condition of the cell, it is therefore of importance to make regularly observations of the density of the solutions, and by recording these and other observations, exact information of the condition of the battery is secured. Below a copy of the tabular form issued by the Chloride Electric Storage Syndicate is given, and is strongly recommended to all using accumulators. If the cells are in good working order, there should be the same variations in the density of the acid in all the cells, and the voltage on open circuit should remain constant when the cells are fully charged. The following are the headings of the daily and weekly records referred to above:—

Installation at.....cells, each containing.....plates.
Consisting of.....cells, each containing.....plates.

DAILY RECORD.

Day of Week.	Date.	Commenced Charging at Hr. Min.	Finished Charging at Hr. Min.	Average Current in Amperes.	Maximum Volts during Charge.	Specific Gravity of Acid in Hydro-meter Cell.	
						Before Charging.	After Charging.

WEEKLY RECORD.

Week ending 189...

No. of Cell.	Before Charging on Open Circuit.		After Charging.	
	Specific Gravity	Volts.	Specific Gravity on Open Circuit.	Volts on Dis-charge.

As is probably well known, the specific gravity

of the solution is obtained by means of a hydro-meter, and at least half an hour should elapse after the charging of the cell is completed before the specific gravity of the cell is taken, so that the solution is in its normal condition. Cell-testing voltmeters should also be used for taking the E.M.F. of each cell.

Having pointed out the faults, we may now mention the advantages of using accumulators.

1. The current from charged accumulators is available at any instant.
2. Lamps fed by accumulators give a steady light without fluctuation, as the accumulators are practically self-regulating.
3. When used in conjunction with dynamos for lighting purposes, accumulators smooth down all irregularities of driving. Accumulators are therefore particularly adapted for use with gas-engines.
4. Accumulators are particularly adapted for isolated plants in connection with the lighting of private houses, since the dynamo may be placed some distance from the house, so that noise, vibration, and smell are avoided. They may be charged when convenient.

DISTRIBUTION.

The distribution of electricity comprehends the study of the best means of disposing of electrical energy economically to a number of receiving mechanisms. This study includes the consideration of the choice of a system of distribution from

Fig. 15.

a variety of systems, to suit the particular requirements and needs of the case; the expenditure of capital and loss of energy; the control, regulation, and permanence of the working conditions of the conductors forming the network. It is thus evident that the problem of distribution is one of the most important problems encountered by the electrical engineer. The systems of distribution vary principally by reason of the different methods of arranging the conductors as indicated by the arrangement of the receiving apparatus, which is indicated by the service which they have to perform. And here it may be remarked that the character of the success of an installation corresponds largely to the attention paid to the selection of the means to distribute the electrical energy.

The Line.—We have already defined an electric circuit as the complete path traversed by electricity, and for lighting and power purposes an electric circuit is composed of.

1. A source or generator to impress the required electrical pressure (E.M.F.) on to the circuit.
2. The line or conductor connecting the source with the receivers.
3. The receiving mechanisms, such as lamps, motors, &c.

It is with the second that we have now to deal. The term "line" is here used to include the conductor, supports for the conductor, such as posts, culverts, insulators, and protecting devices generally. The essentials of a line are:—

1. *Continuity*, so as to form a connecting-link between the generator, lamps, &c. This is assured by using a continuous metallic conductor as lead and return.
2. *Protection*, so as to prevent leakage and to secure safety. This is assured by introducing high insulation resistance, and by inclosing the conductor in casing and culverts or by supporting it on well-insulated posts, as in aerial lines.

As is well known, metals are the best conductors of electricity, and consequently metals are invariably used so as to give the continuity required. The conductor may be solid, or composed of a number of wires stranded together. Stranding gives flexibility, and avoids the rigidity of thick bars or rods, so that the conductors may be the more easily handled. Generally the conductors are of circular section, in which form they are more conveniently covered for insulating purposes, and rarely in practice do we find solid wires exceeding 0.08in. in diameter (No. 14 S.W.G.). It thus follows that the main cables are almost invariably stranded wires, whilst for branch wires leading to and from single lamps a single conductor of No. 22, 20, 18, or 16 S.W.G. is often used. Many fire insurance companies, however, insist that No. 20 must be the smallest, and No. 18 the largest, single conductor used in an installation. The stranded cables used as mains for carrying large currents are made up of a number of wires, usually consisting of 3, 7, 19, 37, 61, or 91 strands, the wires composing the strands being Nos. 22, 20, 18, or 16 S.W.G., according to the carrying capacity of the cables required, and if seven No. 16 wires are used to form a strand, the cable is termed a 7/16 cable, the former number always referring to the number of separate wires, and the latter to the gauge of the wire. In practice, 3/22, 7/16, 19/14, 37/18 cables are much used. Presently the laws relating to the proper carrying capacity of wires will be considered, but before doing so it is necessary to discuss the question of insulation.

Insulation.—As we have already pointed out, it is just as necessary to confine electricity in well-defined paths as it is to supply means of conducting electricity—that is, conductors must be insulated. For this purpose materials (called insulators) which offer a high resistance to the passage of electricity are used to surround and completely envelop the metallic conductors with a perfectly uniform and continuous coating. The following are among the best insulators:—Air, oils, paper, indiarubber, guttapercha, resinous and bituminous compounds. In some cases for temporary work, and for dry situations, the insulation consists of cotton or hemp woven into a braid and well soaked with indiarubber solution, pitch, tar, or resin. For electric light and power cables the essential properties of a good insulator are:—(1) High specific resistance or resistivity; (2) mechanical strength and toughness—this is partly secured by increasing the thickness or number of layers; (3) durability; (4) flexibility with no tendency to crack; (5) capability to resist abrasion; (6) should be homogeneous (to resist disruptive discharges), waterproof, and not affected by temperature, moisture, acid, and gases.

Of the various materials possessing the above properties to a greater or less degree, experience points to the superiority of the various forms of indiarubber when properly prepared and of good quality. At this point it will be well to refer to the characteristic properties of fibrous materials, guttapercha, and indiarubber.

Fibrous materials, such as braid of hemp or cotton saturated with insulating compounds, are specially adapted for very dry situations and low pressures. For damp situations they are never recommended, since they readily absorb moisture, and so lose their insulating properties.

Guttapercha, although extensively used for submarine cable cores and underground telegraph lines, has not proved itself suitable for insulating electric-light and power cables. Its main defect is its low melting-point and a tendency to soften at low temperatures. Consequently, there is the possibility of the metallic conductor displacing itself because of its weight; and since the temperature of the conductor increases with increase of current, there is much to prevent its wide adoption. It is practically useless for temperatures higher than 100° Fahr. and for exposure to the atmosphere in cold weather or in very dry places, in which case it becomes brittle, and readily cracks. It is, however, suitable for immersion in water between temperatures of 40° and 80° Fahr.

Indiarubber of all substances fulfils the requisite properties to a high degree; but there is the disadvantage that the best rubber, especially that brought from Para, is very expensive, in addition to which there is a tendency to set up decomposition of the rubber if pure rubber alone is used when the temperature rises. Consequently, various combinations of rubber have been introduced. "When first used for insulating cables,

GROUND-PLAN

WHEELWRIGHT GRAMMAR SCHOOLS, DEWSBURY.

the pure rubber was cut into strips, and wrapped spirally round the conductor, this being the easiest way of applying it, and requiring only very simple machinery. A cable made in this manner is by no means satisfactory, as the covering is not homogeneous or waterproof. The application of a little heat—as, for example, by dipping the cable in hot water—will make the overlapping edges stick together, so that for the time it appears to test well in water; but this very sticking together is the result of the rubber commencing to decompose, and the decomposition, once started, will rapidly increase, especially at high temperatures, and will eventually destroy the rubber, both mechanically and electrically.

To overcome this difficulty, a compound rubber has been introduced, the rubber being thoroughly mixed and kneaded together with litharge, French chalk, oxide of zinc, barytes, lampblack, sulphide of lime &c. The result is a compound mechanically stronger, and less likely to decompose than pure rubber, and although the specific insulation resistance is diminished somewhat, a very satisfactory insulating material is produced. The form of rubber, however, which experience has shown to satisfy the conditions imposed for insulating materials is vulcanised rubber. The operation of vulcanising, or curing, as it is sometimes called, is a method of treatment to prevent decomposition of the rubber. It is a process of mixing a small quantity of sulphur with pure rubber, and subjecting the mixture to a temperature of from 250° to 300° Fahr.

Experience has shown that vulcanised rubber is more durable than pure rubber; that it is mechanically stronger, more flexible, and capable of withstanding a higher temperature without

injury. This result is due to the chemical combination which takes place between the rubber and sulphur during the operation of vulcanisation, in consequence of which the decomposing action of pure rubber is neutralised.

A layer of pure rubber is often interposed between the copper wire and the vulcanised rubber that surrounds it, because if an excess of sulphur be used when vulcanising, the free sulphur acts on the copper, and produces deterioration. At the present time, vulcanised rubber is extensively used.

In practice, the branch wires do not require so high an insulation as the main cables, although circumstances vary considerably, and each case should be considered separately. For most cases an insulation resistance of 300 meg-ohm-miles is sufficient for branch circuits, and 600 meg-ohm-miles for the main circuits. In a few cases, especially for very dry situations, the branch wires may require only 150 meg-ohm-miles as the insulation resistance, although the use of such low insulation resistances is not recommended, and its use should be restricted for lighting and power circuits.

The following is the description of the insulation of the qualities just mentioned:—

Vulcanised Rubber Insulation (300 to 600 meg-ohm miles).—Insulated pure indiarubber, then vulcanised indiarubber, indiarubber-coated tape, and the whole vulcanised together, braided, tarred flax, and coated preservative compound.

Pure Rubber Insulation (150 meg-ohm miles).—Insulated one coat prepared cotton tape, indiarubber, a second coat of prepared tape, braided, tarred flax, and coated preservative compound.

(To be continued.)

WHEELWRIGHT GRAMMAR SCHOOLS, DEWSBURY.

MANY readers were puzzled last week, probably, by the appearance on p. 718 of what purported to be the ground-floor plan of these schools, which we otherwise correctly illustrated. The plan that was given was wrongly inserted, having nothing to do with the above schools, but belonging to a subject yet to be given. We herewith give the ground-floor plan in question. The architect of the schools is Mr. J. Lane Fox, of Dewsbury.

PROPOSED AMENDMENT OF THE LONDON BUILDING ACT.

THE London County Council has determined, upon the recommendation of its Building Act Committee, to apply to Parliament next Session for some important amendments in the London Building Act, 1894. In a report upon the matter the committee point out that recent decisions in the High Court as to the construction to be put upon certain sections of the Act are such as appear to render the working of the Act as it stands very difficult. The first point in which amendment is desired is with reference to the procedure in the case of dangerous structures. Some delay has occurred owing to a recent decision of one of the magistrates as to the service of the necessary summonses, in which he held that service by affixing a copy upon the premises was not sufficient unless the Council had, after some reasonable inquiry, failed to find the owner. The High Court, when applied to for a *mandamus* to the magistrate to hear the summons with which he had declined to proceed,

decided that if the Council made reasonable inquiry, and could not discover the owner, a summons could be served by affixing a copy on the premises, but discharged the *mandamus* on the technical ground that no evidence was given before the magistrate that such inquiry had been made. The committee think that that decision will put a serious difficulty in the way of proceedings, as it must involve in each case a search for documentary proof of the ownership of premises before a summons can be taken out, as without evidence of ownership the case might be dismissed, with costs against the Council. They consider it essential that structures certified to be in a dangerous state should be dealt with with the utmost promptitude, and this will, they say, be impossible if such inquiries, which have never hitherto been required, have to be made. The section of the London Building Act dealing with the matter is to be so amended as to make it clear that in all cases of dangerous structures all documents in proceedings may always be served on some person on the premises to whom such documents relate, or, if no person be found on the premises, by affixing such documents thereto. An amendment of section 14 of the Act is also to be asked for, in order to make it clear that no part of any new building shall be erected with its boundary fence or wall at less than the prescribed distance from the centre of the road. An amendment of another section is desired to make it clear that no working-class dwelling shall be erected within 20ft. from the centre of the street or way on which it abuts. Amendments are also to be asked for in relation to the clauses providing that penalties for certain offences under the Act can only be enforced when an order of the magistrates is not complied with.

OUTLET AND INLET VENTILATING APPLIANCES.

WE have received a copy of Messrs. Hayward Brothers and Eckstein's new ventilator catalogue, in which several excellent inlet and outlet ventilators are shown. The "Improved Sheringham" ventilator (Eckstein's patent) for the admission of fresh air through external walls, without the discomfort of draught, is a great improvement on the old form. The front valve is allowed to open inwards, as far as desired, which directs the current of fresh air upwards to the ceiling, where it spreads and forces the air of room up the chimney. The front, or valve, can be adjusted to any angle, or closed entirely by a cord and weight. The ventilator is made in iron, japanned bronze, white and gold, or galvanized, and in four sizes—9in. by 3in., 9in. by 6in., 13½in. by 6in., 15in. by 10in., to suit the brick-courses, and the prices are very reasonable. The "Khola" new inlet ventilator has a fixed front, with hanging valve on the top, which is allowed to open as required by a cord. Several patterns of improved "mica outlet ventilators" are shown, square and oblong in shape, and having brass trellis fronts. Some of these are on the "hit-and-miss" principle, and can be closed if necessary. The "Choo" patent noiseless ventilator, for the discharge of vitiated air into smoke flues, the "Union" ornamental inlet ventilators, Hayward's "Louvre" ventilator, a very good type, and other patterns are shown, all deserving the notice of architects and builders. Particulars can be obtained of the manufacturers, Messrs. Hayward Brothers and Eckstein, Ltd., Union-street, Borough, S.E.

BOOKS RECEIVED.

The Sanitary Inspector's Handbook. By ALBERT TAYLOR, Assoc. San. Institute, &c. Second Edition (London: H. K. Lewis, Gower-street).—The author of this handbook is a competent authority on sanitary matters and a practical inspector of nuisances, and his book will be found of service to all in his vocation. As a means of comparing the law of public health of the Metropolis and other parts of the kingdom, the work will be found of service not only to sanitary authorities and inspectors, but to architects and builders. The author gives a useful alphabetical synopsis of the provisions of the Acts. Every sanitary question receives attention: abatement of nuisance and procedure, house drainage, testing closets, soil and waste-pipes, gullies and traps, ventilators, meat inspection, slaughter-houses, lodging-houses, factories

and workshops, dairies, &c. The pages are full of carefully-prepared illustrations of sanitary apparatus and details of traps and drains, as Duckett's self-acting slop-water closet, Crapper's Kenon trap, numerous kinds of patent joints, as those of Doulton's and others; forms of house inspection, of notices to owners, &c., and other useful data, and the book will be found of great use to those who are seeking to qualify for inspectors.—*Later Renaissance Architecture in England*, by JOHN BELCHER and MERVYN E. MACARTNEY (London: B. T. Batsford, High Holborn). Part II. of this valuable series of examples of the English Renaissance, being domestic buildings, erected subsequent to the Elizabethan period, maintains a high character. These photo-prints are of excellent quality, sharp and clearly defined in the detail, and have been specially prepared for the work. In the present part twenty-six tinted plates are given, all representing examples of Later Renaissance domestic buildings. Several very beautiful and typical specimens of the style are selected; amongst them is Raynham Hall, Norfolk, a balanced structure of Ionic Classical features of imposing size, brick and stone, the centre adorned with engaged Ionic columns supporting a pediment on a rusticated basement, the end, with scroll gables, surmounted by pediments. The Customs House, King's Lynn, has almost a French feeling about the design, and high hipped roof with its cupola. Of late work verging on the Classical taste of the 18th century is the Temple of Eolus at Kew Gardens, Queen's College, Oxford; the gateway and cupola, Houghton, Norfolk; Ely House, Dover-street, W.; and a corner of South Audley-street, very typical examples of two different phases; views of Greenwich Hospital, Hampton Court Palace river front. A fine interior view of the Library, Trinity College, Cambridge, shows the handsome carved bookcases between the windows, with details of panelling. Less known examples, but of great interest, are Wolvesey House, Winchester; Lyttenhanger, Herts, a fine brick front; a house in West-street, and Swan House, Chichester; Farnham Castle staircase. A fine carved staircase is that in a house in High-street, Guildford. Two admirable examples in interior decoration are among the plates from the Skinners' Hall, and from a house at Epsom. The work is to be completed in six parts, at a guinea a part.—*Workmen's Compensation Act, 1897*, by W. ADDINGTON WILLIS, LL.B., London, of the Inner Temple, barrister-at-law (London: Butterworth and Co., Fleet-street, E.C.).—This little handbook of the Act gives, in a concise form, the provisions and schedules of the Act which comes into operation on the 1st of July next year. The law will revolutionise the existing relations between employers and their workmen who have been injured, and it is necessary that the employer and workman should study the statute, so as to enable them to understand their position and to make the necessary arrangements. The Act casts upon employers a great responsibility—viz., to make provision for every workman injured by accident in their employ. The insurance companies and other benefit societies will be greatly affected by it in different ways. The workman himself ought to acquaint himself with the provisions, so as to enable him to consider a joint scheme as a substitute for the Act by which they will be able to make terms advantageous to both parties. According to this Act the employer is compulsorily called upon to insure his servants against injury by accidents. It is limited to accidents in certain trades where the risks are great, and the sections extend to injuries arising from accident. These provisions are set out clearly with notes, and the schedules appended show the method of assessing the amount; arbitration for this purpose being substituted for litigation. Every employer and workman ought to study this little summary.—A new and cheaper edition of *Practical Building Construction*, by J. P. ALLEN (London: Crosby Lockwood and Son, 7s. 6d.), is issued. There is no better book for the student, or for men actually engaged in work, and its price now brings it within the range of everybody.—*The Commercial Uses of Coal-Gas*, by THOS. FLETCHER, F.C.S. (Fletcher, Russell, and Co., Ltd., Warrington, Manchester, and London), is a little volume of notes, the result of thirty years' experience, on the practical results of coal gas as a fuel. Valuable data and figures will be found on gas-supply; pipes, their areas, minimum bore, and greatest length, and the cubic feet supplied, the gas consumption per hour of different bores. The heating-power of

gas is given, from which it appears that 1c.ft. of coal-gas will melt 2lb. of ice, heat one gallon of water 50° Fahr., heat 1,500c.ft. of air 30° Fahr., boil one pint of water, keep an iron plate 1ft. square at 380° Fahr. for fifteen minutes, &c. Drying by heated air, press-heating, and various industrial and domestic uses are treated in separate sections. This little book will repay study by all gas consumers and engineers.

CHIPS.

The contract for the erection of the Edward Richard Memorial Church at Ystrad Meurig has just been let for £1,515. It is proposed to erect a tower at a cost of about £1,000, in addition to the church.

An infirmary is about to be added to the workhouse at Falmouth, from plans by Mr. Powell. Mr. W. H. Dunstan, of Falmouth, is the clerk of works, and the tender of Messrs. Rich and Son, of Penryn, has been accepted for the work at £1,980.

The tender of Mr. J. Hampton Matthews, Harrogate, of £2,155 for the works in connection with the Bilton (Harrogate) sewerage scheme has been accepted by the Knaresborough Rural District Council.

The St. Olave's Guardians have appointed Mr. George Hillier clerk of the works at the new union offices which are to be erected at Shad Thames, Tooley-street, and which will cost, with the site, nearly £30,000.

The first half-yearly meeting of the West of England and South Wales Federation of Master Builders was held on Monday in last week, under the presidency of Mr. August Krauss, at the Guildhall, Bristol. The conference was well represented by delegates from Bath, Bridgwater, Bristol, Newport, Mon., and Weston-super-Mare. The chairman remarked that it was now six months since the federation was formed, and there was now peace in the entire district.

A mural tablet in statuary marble has been placed in the church of SS. Peter and Paul, Brockdish, Scole, in memory of the late Lord Justice Kay. It is elliptical in form, with the arms of the deceased judge carved and emblazoned in colours. There was an elaborately-carved canopied monument, designed by Mr. J. K. Colling, put up in the churchyard some time back in memory of the late Lady Kay, and this has simply had an inscription added to it. Both of these works were carried out by Messrs. J. Forsyth, of Finchley-road, Hampstead.

On Saturday memorial-stones of a new Sunday-school in connection with Grenville Wesleyan Chapel, Hotwells, Bristol, were laid. The scheme involves an outlay of £2,000. The buildings will accommodate between 300 and 400 children. They will occupy a site contiguous to the chapel, with which they will be connected, and will include a large schoolroom, with an open-timber roof, and four small classrooms, with offices. The buildings will be erected with local red facing bricks, relieved with Bath stone dressings. The architects are Messrs. S. Paul and James, and Messrs. Eastabrook and Sons, also of Bristol, are the builders.

The contemplated scheme for the Quarrier Consumption Hospitals of Scotland will cost about £60,000. There will be six hospitals, containing in all 200 beds. Over £20,000 has now been received, which has been expended on the first hospital and necessary buildings.

Mr. W. J. Dibdin, late chief of the chemical and gas department of the London County Council staff, was presented, on Saturday, with an illuminated address by Dr. F. Clowes, the new chief, on behalf of the officers of the department.

A font has just been despatched by steamer to the new cathedral at St. John's, Newfoundland. It has been designed by Mr. J. Oldrid Scott, F.S.A., under whom the cathedral, which was unfortunately consumed by fire a few years ago, is being rebuilt by sections, as means allow. The font is in the Decorated style, and has a central shaft surrounded by columns of polished Levanto marble. The bowl is circular, and of the same mottled marble. The font, which is of exceptionally large proportions, girthing over 10ft., has been made in the studio of Messrs. Harry Hems and Sons, of Longbrook-street, Exeter, by whom the carved oak fittings in the choir were also executed.

The Secretary for War has directed that the attention of officers commanding troops shall be given to the necessity of intelligently and energetically carrying out the portions of the Queen's Regulations which relate to teaching soldiers useful trades, and effecting repairs to barracks by the regiments occupying them. The Commander in Chief adds his opinion that it should be extremely rare for troops to be unable to execute such repairs as may be requisite to keep their barracks in order, with the co-operation of the Engineer and Barrack Departments.

OBITUARY.

ARCHITECTS and others who were more or less acquainted with the late Mr. J. ALDAM HEATON will learn of his death with unqualified regret. In a quiet unassuming way Aldam Heaton carried out with a freedom from affectation a great variety of work, and in co-operation with his old friend, Mr. R. Norman Shaw, R.A., furnished and decorated many country houses and other buildings in an unconventional style and in the best of good taste. Aldam Heaton was an instinctive artist, and although he entertained an unqualified dislike to the productions of the mere manufacturer on the one hand, he was equally severe on the queer and extravagant methods of what has been called the "art and crafty" school. Mr. John Aldam Heaton was born at Leeds in 1830, and he died on Saturday, the 20th inst., in London. A few years ago a paralytic seizure commenced a long and sad illness, from which he partially recovered, keeping to work almost to the very last. He was educated at Repton, Derbyshire, one of the old foundation schools, and was the son of Mr. John Heaton, partner of the old firm of Aldam, Pease, and Co., dealers in Yorkshire fabrics. He was apprenticed as a dyer and weaver, and at the age of 30 Mr. Heaton introduced many improvements in the Jacquard loom, while he was employed as a manufacturer in Bradford. His tastes were, however, far more in accord with the artistic side of his business, and his early endeavours at design developed in attractiveness to such an extent as to induce him to leave his Yorkshire business and settle in London in 1875, when he began to design embroidery and decorative painting. His skill soon brought him work, and as business extended Mr. Heaton embarked successively in furnishing, upholstery, cabinet-making, mural ornament, and stained-glass making. The *Teutonic* and *Majestic* steamers were decorated by him, and the ornamentation of saloon dining-cars for the London and North-Western Railway were among his undertakings. Several churches were enriched by his designs, and stencilling in his hands developed into a fine art. At the present time his establishment in Bloomsbury-street is exceedingly busy, and lately some large ceilings of elaborate character were executed by him for a new palace in India. Mr. Heaton had considerable literary ability, and was a racy and forcible writer. He read papers of much value before the Royal Institute of British Architects, the Architectural Association, and other artistic societies. He wrote for the *Art Journal* on "Colour" and "Form." In 1889 Mr. Heaton edited a big work on "Furniture and Decorations in England During the Eighteenth Century," in two folio volumes, published by Mr. Bumpus. We gave a portrait of Mr. Aldam Heaton in the *Building News* for April 25, 1890.

THE sudden death is announced of Mr. CHARLES JOHN SHOPPEE, F.R.I.B.A., a well-known architect, having an extensive City practice. Mr. Shoppee, who was in his 74th year, was at his office in John-street, Bedford-row, on Saturday, the 13th inst., when he appeared to be in excellent health, and on the Sunday following he attended Divine service at the chapel of Gray's-inn, as had been his custom for upwards of forty-six years. On the Monday morning, however, he was suddenly taken ill, and he passed away at his residence, 41, Mecklenburgh-square, on Thursday morning, the immediate cause of death being failure of the heart. He was well known and respected in the City as a member of various guilds. Mr. Shoppee was the eldest son of the late Mr. Joseph Shoppee, of Uxbridge. His family had been connected with that town for four generations, and he was born there on December 9th, 1823. He was educated at Uxbridge School, and then became the pupil of the late Mr. Thomas Morris, of Regent-street, subsequently entering the office of Mr. Raiton. In 1851 Mr. Shoppee commenced to practise on his own account at 61, Doughty-street, Gray's-inn, and in 1878, together with his eldest son, who had then joined him, removed to new offices at 22, John-street, Bedford-row. Two years after commencing practice he passed the examination for district surveyor, while he was admitted an Associate of the Royal Institute of British Architects in 1862, and a Fellow of the Institute in 1880. He was elected a Fellow of the Surveyors' Institute on its foundation in 1868, became a member of the council in 1870, vice-president in 1885, and president in 1892, holding the last-named office

for two years. During this period he served on the Tribunal of Appeal with regard to the Metropolitan Building Act, and he also represented the institution at the congresses of surveyors held at Paris in 1879 and 1889. He had considerable experience as an arbitrator and umpire in references and compensation cases, and also as an assessor in architectural competitions. In addition to the Surveyors' Institution, he was connected with the Surveyors' Association, and at the time of his death was, with one exception, the senior member of that body. He was an active member of various City guilds. On three occasions he served the office of master of the Armourers and Braziers' Company, and he was, in fact, the immediate past-master of that company. He was also a past-master of the Barbers and Glovers' Companies, and, as a member of the City and Guilds of London Institute, he did much to advance the cause of technical education. The restoration of the old hall of the Barber Surgeons' Company was carried out under his direction. Together with his son, Mr. Charles Herbert Shoppee, he acted for the Home and Colonial Society in the erection of the Reynolds Memorial Schools and the Evans Memorial Chapel, and he was also responsible for the erection of many blocks of buildings in the City. For many years he was annually elected deputy-governor of the French Hospital, as a representative of the old Huguenot family of "Chapuis," the original name of his great-grandfather. He was also a vice-president of the London and Middlesex Archeological Society and of the Ex-Libris Society, and a member of the American Numismatic Society, and was regarded as an authority upon heraldry and scarce books and prints. The practice will be carried on by his son, Mr. Herbert Charles Shoppee. The funeral took place on Monday at Uxbridge Cemetery.

THE death occurred in Edinburgh on Sunday of Mr. KENNETH MATHIESON, in his eighty-first year. For a number of years Mr. Mathieson took an active part in the public affairs of Dunfermline. Entering the town council in 1853, he sat continuously till 1877. For six years he was Provost, and during that time was instrumental in getting a Bill passed for the introduction of a water supply from Glensherup. He also saw the scheme for the erection of the present suite of municipal buildings carried through. Mr. Mathieson was a man of conspicuous business ability, and as a contractor carried out many important works. Along with his father he built the new bridge at Stirling, and he was the contractor for the Dunfermline and Stirling railway, besides being engaged in various large undertakings in England.

Mr. H. H. BROWN, member of the contracting firm of Coleman, Ryan, and Brown, of New York City, which is building the large Croton dam, died on November 9 on the steamer *Puritan*, while on his way to Boston, Mass. He was one of the richest contractors in the United States. He began work as a labourer in the construction of Central Park, New York, and rose to be an extensive employer of labour. He was engaged on the construction of the Union Pacific and other railroads in the West, built the Park Avenue tunnel in New York City and two sections of the new Croton aqueduct, and had just completed some extensive work in changing the grade of the New York, New Haven, and Hartford Railroad lines in the vicinity of Boston.

A boys' department is being added to the board schools at Erdington, Birmingham, from plans by Mr. C. Whitwell, at an estimated cost of £5,700.

The well-known Conciliation Hall in Burghstreet, Dublin, which of late has been utilised as a corn store, has just been transformed into the Grand Lyric Music Hall under the direction and from plans by Mr. W. H. Byrne. Messrs. Meade and Son were the contractors.

A special meeting of the Health Committee of the Liverpool Corporation was held on Monday for the purpose of considering certain rearrangements of the staff of the department consequent upon the resignation of Mr. H. P. Boulnois, city engineer and building surveyor. After some discussion, it was decided to recommend the City Council to promote Mr. William Goldstraw, deputy-building surveyor, to the position of building surveyor to the corporation, and to increase his salary from £350 to £450 per annum. The meeting also resolved that a successor to Mr. Boulnois as city engineer be advertised for, a salary at the rate of £1,000 a year being offered. A sub-committee was appointed to deal with the applications, and make recommendations to the general committee.

Building Intelligence.

ALDEBURGH.—Building operations continue very active at this quiet East Suffolk watering-place. A new detached residence has been erected on the Aldeburgh Park estate by Mr. G. O. Knowles, and leased by Mr. Woodcock, architect, who will soon come into residence. Another house on the same estate, which is now being roofed in, is from a design of Mr. Thomas Key, the contractor being Mr. J. E. Stannard. Many of the plots of nearly an acre in extent on the Crescent estate have been sold. A new residence, from the design of Mr. Thomas Key, has been completed by Mr. G. A. Knowles, who is building a very large residence on the eastern portion of this estate, from designs by the same architect, for himself. At Brudenell-terrace, five marine residences, each five stories in height, are in course of erection; the plans are by Mr. T. Key. The South Lodge estate has changed hands, the older portion having been purchased by Mr. G. O. Knowles, and cleared ready for a terrace of houses, from designs by Mr. Wade, a London architect. Improvements are also noticeable in the main street. Colonel Smyth having sold the London House property, the site will be cleared, and the purchaser has instructed by Mr. H. J. Wright, of Ipswich, to design a new residence.

BIRMINGHAM.—A number of large Gothic villa residences are in course of erection in the Woodbourne-road, Edgbaston, on the building estate of the Right Hon. Lord Calthorpe. The contractor is Mr. Edward Airey, of Giltott-road, in this city. At the village of Knowle, about nine miles from Birmingham, a number of old cottages belonging to Mr. Samuel Scoltock, having a frontage of about 70ft., have been entirely remodelled. The whole of the internal portion has been "gutted," the building raised several feet, and the front elevation—Gothic in style—brought up to date, by the insertion of bay and two-light windows, porch, shop-front, ornamental cornice, chimney caps, moulded barge boards, &c. The contractor was Mr. S. Needle, of Knowle. The architect for the above buildings is Mr. J. Statham Davis, of Sparkbrook, Birmingham.

EDINBURGH.—A new United Presbyterian Church, in Fountainhall-road, was formally opened on Thursday in last week. The church has been built from the designs of Mr. Graham Fairley, architect, Edinburgh. Alike in plan and design, the edifice is an adaptation of the 13th Century Gothic architecture to the requirements of a modern church. Included in the plan are the traditional nave, aisles, transepts, and chancel; and while the nave is wide in span, the aisles are narrowed to side passages. There is no gallery. The chancel, in which stands a communion table of oak, is reserved for the use of the elders, and the choir are accommodated in the east transept, where accommodation for the organ, which is built to designs by Mr. Eustace Ingram, London, is also found. A low parapet wall of stone is built in front of the church, separating the ground from the footway, instead of the iron railing usually adopted. There are several stained-glass windows, most of them gifts from members of the congregation. Two of the windows in the chancel were brought from the former church in Infirmary-street. The windows lighting the aisles are also in stained glass. On the east side these represent historical Old Testament characters, while on the west the representations are of New Testament figures. The pulpit is of Caen stone and red marble, and in the niches are figures of the Saviour and of the Apostles Paul and Peter. The desk is of polished brass work. In the centre of the chancel is a lectern of hammered brass-work, and on the east side a font of the same material as the pulpit—both gifts. The church will accommodate a congregation of 600. The seats are of pitchpine, stained a dark green tint; and the roof is of open-timber work, also stained. Provision is made for the lighting of the building by means of electricity, the heating being on the low-pressure system. Behind the chancel are the halls and offices. The large hall gives accommodation for 200, and is furnished with an open-timber roof. The building is valued at about £8,000.

GLASGOW.—A meeting of the sub-committee of the Glasgow Corporation Parks Committee was held last week to consider an outline of the

scheme proposed for the sculpture and carved work of the new Art Galleries. The following chief carvers were recommended:—North façade, William Shireffs, 287, West Campbell-street; south façade, J. C. Young, 197, Dumbarton-road; east and west façades, William Vickers, 221, West Regent-street; bronze figures on towers and north porch, A. M.F. Shannon, 7, Scott-street, Garnethill; central hall, R. A. McGilvray and Ferris, 129, West Regent-street; and east and west courts, James M. Sheriff, 20, Canning-place. It is estimated that the work will cost £15,644. There is a provisional sum of £5,007 included in existing contracts which is available towards the proposed expenditure. The sub-committee adjourned consideration of the scheme in order that more information might be laid before them as to the cost of the sculpture work.

HALIFAX.—A group of gas offices, which has just been completed for the gas committee of the town council, is situate in Mulcture Hall-road (adjoining the gasworks), and has a frontage to that road of 225ft. It consists of drawing-office and plan-rooms, engineer's, engineer's clerks', general, and coke offices, store-room and store-keeper's office, telephone room, waiting-room, and lavatories on the ground floor, with a hall and staircase. The first floor provides committee-room, laboratory, photometer, and four store-rooms. Adjoining are two houses for night and day foremen. The workshops are adapted for the various works connected with the making of lamps, meters, and general repairs. The basement consists of store-rooms for pipes and fittings. The work has been carried out by local firms, from the designs and under the direction of Mr. W. H. D. Horsfall, architect, of 9, Harrison-road, Halifax, who was also intrusted with the borough electric light works for the same council.

LORDSHIP LANE, S.E.—The new Passmore Edwards Public Library in Woodwarde-road, Lordship-lane, Dulwich, was formally opened on Wednesday by the Lord Chancellor. The library is one of the numerous institutions of this class presented by Mr. J. Passmore Edwards, and occupies a site given by the Dulwich Estate Governors. It has been erected from designs by Messrs. Charles Barry and Co., and under their superintendence. The building is of red brick, and with Bath stone dressings and moulded-brick strings and cornices. The floors are fire-proof, and are constructed on the principle of Messrs. Mark Fawcett and Co., of Queen Anne's Gate, Westminster. Messrs. James Gough and Co., of Hendon, took the contract at £5,834, and Mr. J. Bint was the clerk of works. We illustrated Messrs. Barry's design in our issue of Oct. 25, 1896.

NOTTING HILL-GATE, W.—The plans of the new Coronet Theatre have just received the final approval of the London County Council. Mr. W. G. R. Sprague is the architect. The building will occupy a site in High-street, Notting Hill-gate, open on three sides, having frontages to High-street, Johnson-street, and Uxbridge-street. The frontage is to be entirely of white Portland stone. The audience will enter to the better part of the house direct from the High-street. The house is to be on the two-tier system, and is without a single column, the construction throughout being of concrete and steel. On the lowest level are stalls, pit-stalls, and pit, the first circle consisting of dress-circle and balcony, and second circle consisting of amphitheatre seats and gallery. The stage is some 40ft. deep, with a width of 65ft., and a height of 55ft. to grid. The decorating and furnishing throughout will be in Louis XVI. style, and the electric light will be employed. The theatre will be able to accommodate some 2,000 persons, and will be ready for opening early next autumn. The cost will be about £25,000.

PARTICK, GLASGOW.—St. Bride's Church, in Rosevale-street, Partick, was opened on Saturday. The new church is of undressed stone of a red colour, with a roof of open timber. The church proper will accommodate 800 persons, and, in addition, there is a hall accommodating 300. Internally, the building consists of an open nave, free of galleries; an aisle, separated from the nave by an arcade of four arches, and with a gallery; a deep chancel for the choir and the Communion table, a side chapel, an organ-chamber, and a font recess. The estimated cost is £4,000. Mr. P. Macgregor Chalmers, Glasgow, is the architect.

PUDSEY.—A new Baptist chapel, erected at Littlemoor, Pudsey, was opened on Saturday. It will supplant an old and inconvenient building which has been used for 47 years, and which will now be converted into a Sunday-school. The new edifice has been erected from the designs of Messrs. Hodgson and Farrar, architects, Bradford and Pudsey, and is in a plainly-treated Classic style, the front being relieved with dressed ashlar piers and moulded cornices. The chapel, which has a gallery running on three sides of it, provides sitting accommodation for about 600 persons. At the east end is a choir and organ gallery, separated from the chapel by a semi-circular arch. The whole of the pews, which are of pitch-pine, radiate to the rostrum. The latter is of pitch-pine and mahogany. There are three vestries on the level of the chapel floor, and advantage has been taken of the fall in the site to get a kitchen, rooms for a Young Men's Christian Association, and two classrooms in the basement, but above the level of the ground. The ceiling of the chapel is treated with a lantern running the length of it, relieved with ornamental plaster-work. The heating is by hot water, on the low-pressure system.

STRETTON.—The Bishop of Lichfield consecrated on Wednesday a church at Stretton, Burton-on-Trent, which has been built by Mr. Gretton, of Sudbury Hall, at a cost of considerably over £30,000. It is a cruciform edifice of stone, with a massive central tower. The interior fittings and the furniture are elaborate in character. There is a high screen, and the church is also provided with a south chapel. The roof decoration is rich, and the east window, by Sir W. B. Richmond, cost over £1,000. The whole of the woodwork is of oak, and for the most part carved. The church also contains an organ. Accommodation is provided for 400 persons. It has been erected from the designs of Mr. J. T. Micklethwaite, F.S.A., Westminster.

WREXHAM.—New business premises for Parr's Bank were opened last week, the site having a frontage of only 27ft. to High-street and 30ft. to Church-street. The whole of the ground floor, with the exception of a side entrance and staircase, is given up to the bank, and consists of a room 24ft. square and 12ft. 6in. high. The fittings are of oak, and the floor of mosaic paving. On the basement are the strong-room and plate-store, voucher-store, private room, and heating apartments, lavatory for bank officials, and coal-store. Light is reflected to the basement rooms by means of Hayward's semi-prism pavement lights, with tiled wall-space below. The staircase to the first floor is formed entirely of concrete, with walls lined with cream-glazed tiles. The first and second floors are divided up into suites of offices, and on the top floor there is a living-room for the caretaker. In order to devote as much space as possible to the banking-room, the outer walls have been constructed of sufficient thickness only to insure strength and stability, and the massive Classic columnar type of architecture identified with banking premises has been departed from, the exterior having been treated in a phase of English Renaissance. The outer walls are faced with stone from the Abenbury quarries of the contractors. The angle of the two adjoining fronts is emphasised by a projecting octagonal turret, which, carried up through three floors, rises above the main roof, crowned with a copper dome. The structural work has been carried out by Messrs. Davies Bros., of Wrexham. The carving on the façades is the work of Mr. F. G. Lloyd, Victoria-place, Manchester. The gasfitting and ornamental iron-work are by Messrs. Hardman, Powell, and Co., of Birmingham, and Messrs. Waygood and Co., of Falmouth-road, London, supplied the lift. The whole has been carried out from the plans and under the superintendence of Mr. J. H. Swainson, M.S.A., architect and surveyor.

The West Ham Corporation have instructed Mr. A. Saxon Snell, F.R.I.B.A., to prepare plans for the erection of public swimming and private baths at Plaistow, E.

The aggregate realisation at the Mart last week, as officially reported by the Estate Exchange, was £126,943. The tone of the market was very satisfactory, the competition for good investments being brisk, and good prices maintained. Landed property was only represented by one estate, which had, however, to be withdrawn. This week bricks and mortar formed the staple supply, with the exception of several large blocks of building land at Brentwood and Shenfield, Essex, which were sold on Tuesday.

LEGAL INTELLIGENCE.

SINGULAR ACTION AS TO SEWER CONSTRUCTION.—**WHITFIELD V. THE BISHOP AUCKLAND URBAN DISTRICT COUNCIL.**—This action, tried before Mr. Justice Wright and a jury at the last Durham Summer Assizes, was brought to recover damages for injury done to the plaintiff's houses, 18 and 19, Princes-street, Bishop Auckland, caused by the alleged negligence and breach of duty on the part of the defendants, in not properly maintaining and repairing a sewer which was under their control. The sewer was laid along Princes-street in 1866, and the houses in question were built in 1871 or 1872. The pipes of the sewer were the same as those in common use at the time, but without proper flanges to prevent the escape of sewage. In 1879 the sewer was taken over by the defendants. Before 1892 the sewer was repaired, and again in 1892 part of it became defective owing to subsidence, and had to be repaired. Mr. Lindsay, the defendants' surveyor, ordered the pipes to be taken up for a distance of ten yards on each side. In 1895 the plaintiff's houses, which were lower down the street than the place where the repairs were done, were flooded with sewage, causing the damage complained of. It was contended for the plaintiff that the defendants, having knowledge of the defective condition of the joints of the pipes, were negligent in allowing the pipes to remain in the ground. In summing up to the jury, the learned Judge left the following questions to the jury:—(1) Were the foundations of the plaintiff's houses insufficient? Answer.—No. (2) Was the defendants' sewer badly constructed originally—that is, before their time, and, if so, in what respect? Answer.—It was badly constructed in consequence of defective joints. (3) Was the defendants' sewer improperly and negligently maintained or repaired by them, and, if so, in what respect? Answer.—The sewer was improperly and negligently maintained, because the defendants did not examine the drain the whole length of the street on the second occasion upon which they opened it out. (4) Was the damage caused entirely by the bad situation or bad foundation or bad construction of the houses? Answer.—No; it was caused by the water from the sewer. Mr. Strachan, Q.C., for the defendants moved on Monday last for judgment. It was a non-feasance for which no action would lie. The proper remedy for the plaintiff was to complain to the Local Government Board (Public Health Act, 1875, sections 15 and 299). The jury had not found as a fact that the damage was caused by not doing repairs which they had undertaken to do. It was not suggested that there was negligence in maintenance or doing the repairs. In 1892 there was no need to do more than they did. The plaintiff must show that the defendants did something or neglected to do something which they ought to have done. He cited "Atkinson v. Newcastle and Gateshead Waterworks Company," "Robinson v. Mayor and Corporation of Workington," "Leek Improvement Commissioners v. Justices of Staffordshire," and "Cowley v. Newmarket Local Board." Mr. Justice Wright, in giving judgment on Monday, said he thought the findings were contrary to the evidence. He could not say they were perverse. He had to assume that the verdict, such as it was, was right. Assuming it to be right, he saw no ground of liability except misfeasance in the sense that there was something improper or negligent in the way in which the works of maintenance or repair were done. Before 1892 there were partial and local repairs done to the sewer. In 1892 another local and partial collapse occurred. That was made good—not for the whole length, but partially. He should say that all was done that ought to have been done. The jury found otherwise. The jury thought it was reasonable and proper to open up the whole of the length of the sewer. The jury thought it was negligent to do part of the work, and not the whole. Upon the findings he could not do otherwise than enter judgment for the plaintiff. Stay of execution was granted pending an appeal.

RE J. W. BOWLES.—This failure occurred in December, 1895, the bankrupt formerly trading as a contractor at New Wandsworth and Battersea. He had previously absconded, and the Official Receiver subsequently set up a claim to three barges upon the ground either that they belonged to the bankrupt, or that they were in his possession, order, and disposition, as reputed owner, with the consent of the respondent, Mr. James Neal, retired contractor, formerly carrying on business at Wandsworth. It appeared that Mr. Neal, at about the end of 1889, having amassed considerable property, decided to retire from the business, and to give up the same to his nephew, the bankrupt. He asserted, however, that the gift so made did not cover the barges. In giving judgment on Monday, Mr. Justice Wright said he did not think he ought to hold as a matter of fact that the bankrupt had become the owner of these valuable barges, as it was clear that they had not been specifically transferred to him by his uncle, Mr. Neal. Nor had the Official Receiver proved to his (the Judge's) satisfaction that the bankrupt was the reputed owner of the barges, as it was principally a land business,

and the barges were generally lying away from his wharf. Nor was there any evidence of credit having been given to Bowles on the strength of his being possessed of the barges. On both grounds, therefore, the motion of the Official Receiver failed, and must be refused with costs.

LAND DRAINS OR SEWERS?—LONDON AND NORTH-WESTERN RAILWAY COMPANY v. THE RURAL DISTRICT COUNCIL OF RUNCORN.—The plaintiffs in this case, heard by Mr. Justice Stirling on Tuesday, were the London and North-Western Railway and the Great Western Railway Companies, and they claimed an injunction to restrain the defendants from connecting new sewers of the defendants in the township of Helsby and parish of Frodsham, in the county of Chester, with certain land drains and ditches belonging to the plaintiffs, and from causing or permitting sewage or water to flow from the said new sewers into the said land drains and ditches of the plaintiffs. The question at issue in the case was whether the land drains and ditches, which had been constructed by the plaintiffs or their predecessors in title on their own lands, were now vested in the plaintiffs, or, as the plaintiffs alleged, had under the provisions of the Public Health Act, 1875, become vested in the defendants as the rural sanitary authority of the district. The plaintiffs were the successors of a railway company for the purpose of making a railway from the Chester and Birkenhead Railway to the Manchester and Birmingham Railway. This railway was made about the year 1850. At the trial the defendants' case was rested on the alleged user of the ditches in question for the purpose of carrying off the sewage from certain houses near the line. This sewage, it was alleged, passed from the ditches into pipes and drains which had been constructed by the plaintiffs for the purpose of land drainage, and consequently it was contended that these had become sewers within the meaning of the Public Health Act, 1875, and were now vested in the defendants. Mr. Justice Stirling, in giving judgment, came to the conclusion upon the evidence that a certain quantity of sewage did find its way from the houses in question into the pipes or drains on the plaintiffs' land, but at the same time there was nothing to affect the plaintiffs with knowledge that before 1896 such sewage did so pass into their system of drains or pipes. His Lordship further came to the conclusion on fact that these drains and pipes were not constructed for the purpose of carrying away sewage from any house, but were constructed (in the language of the Act of 1845) for the purpose of carrying the water "as clearly from the lands lying near or affected by the railway as before the making of the railway." After referring to sections 4, 13, 15, and 21 of the Public Health Act, 1875, His Lordship then said that the contention on behalf of the defendants might be stated as follows:—The pipes and drains were at the present time, and were previously to 1896, used *de facto* for the drainage of more than one building only; consequently they were "sewers" within the definition of section 4, and were vested in the defendants under section 13. To this the plaintiffs answered (1) that none of the owners of the houses in question had acquired against the plaintiffs any legal title to send sewage into these pipes and drains: that according to the doctrine of "Mulliner v. Midland Railway Company," approved by the House of Lords in "Ayr Harbour Trustees v. Oswald," it was competent for the plaintiffs at any time to put an end to the user which had taken place, and that the vesting under section 13 did not put an end to this right—see "Reg. v. Godmanchester Board of Health," where a strong opinion was expressed that the Public Health Act, 1848, was not intended to interfere with rights of a private nature; (2) that the rights vested in the plaintiffs by the special Act for a specific purpose could not be held to be overridden by a subsequent statute conferring on a public body general powers for a different purpose; and (3) that the pipes and drains in question, if sewers within the Act, were "sewers made and used for the purpose of draining land under a local or private Act of Parliament," and consequently fell within the second exception in section 13. His Lordship came to a conclusion in favour of the plaintiffs on this third point, and it was consequently unnecessary for him to express a concluded opinion on either of the other two. With respect, however, to the first, his Lordship was not satisfied that the plaintiffs' argument was consistent with the general scheme of the Public Health Act, 1875. It seemed to his Lordship that the pipes and drains were made under the special Act. He therefore gave judgment for the plaintiff.

ACTION BY A CONSULTING ENGINEER.—Before Mr. Justice Channell last week, Mr. A. M. Fowler, consulting engineer, of Manchester and London, and formerly borough engineer of Salford, brought an action against Mr. Wood, a brick manufacturer, to recover £15 15s. for professional services. Ten guineas had been paid into court by defendants as sufficient. Mr. Bassett Hopkins said the facts were that the corporation of Stockport had

some drainage works to be carried out, and they called in Mr. Fowler as a consulting engineer of the first rank. The drainage contract was got by Messrs. J. and W. Meadows, who gave an order for bricks to the present defendants, Messrs. P. and S. Wood, whose place of business is at West Bromwich. Ultimately a dispute arose between Messrs. Meadows and Wood as to the amount of money due to the latter, there being a difference in dispute of considerably over £800. An action was brought at Birmingham Assizes in March last, and the plaintiff was subpoenaed to give evidence. He went to Birmingham, and spent some time having consultations and giving evidence. The case was finally referred to Stafford for arbitration, when the defendants got an award; but the present charges were only with regard to the Birmingham action. Plaintiff gave evidence, and said his charges were for three days—two at Birmingham and one day travelling there—at ten guineas a day; one day and a half for searching documents and getting evidence ready; for the time of his assistant, at 2s. 6d. an hour, and out-of-pocket expenses. In cross-examination by Mr. Shakespeare, he said part of the charge was for a consultation with the counsel for the other side. He only stayed in Birmingham one night, and yet he had charged three days' hotel expenses; but he was away from home for more than 36 hours. He was subpoenaed by both sides. Plaintiff was being further cross-examined when his lordship adjourned the case.

CLAIM FOR SPECIFIC PERFORMANCE.—In the Court of Appeal, on Friday, before the Master of the Rolls and Lords Justices Chitty and Vaughan Williams, an appeal was heard, "Cook v. Williams," from a decision of Mr. Justice Kekewich's. Mr. J. M. Cook, tourists' agent, brought an action for specific performance against the five daughters of the late Lady Watkin and Mr. O. F. Giddy, estate agent, of Pall-mall, in respect of an alleged contract for the sale to him of the mansion and estate of Mount Felix, at Walton-on-Thames. After negotiation, the defendants, it was contended, had agreed to sell the property to the plaintiff for £21,250, and he had paid a deposit; but ultimately the ladies declined to complete the contract. Mr. Justice Kekewich held that there was no completed contract in writing, and dismissed the action, and their Lordships now confirmed the judgment, and dismissed the appeal.

WHAT CONSTITUTES A BUILDING?—Before the Bristol magistrates on Nov. 12, Alfred Joseph Neale, 23, West-street, St. Philip's, was summoned by Mr. T. H. Yabbicom, the surveyor to the corporation, under the Bristol Improvements Acts, 1840 and 1847, for causing to be pulled down for the purpose of repairs a part of a shop front or outer boundary—to wit, the cornice and the fascia of 23, West-street aforesaid, and did unlawfully neglect to build the whole of such front or outer boundary so that the boundary should range in the general line of the front walls of buildings in West-street. Mr. W. H. Wise, assistant town clerk, prosecuted, and Mr. F. E. Weatherly defended. In opening the case, Mr. Wise said that the former premises of 23, West-street were laid down by the late Mr. Josiah Thomas, contractor. In the summer of last year a fire occurred at the shop, and damaged the front. In June it was found that a portion of the front had been removed, and a new cornice, fascia, and roof had been substituted. Notice of this ought to have been given, but this was not done, and it was not till the new parts had been put in that it came under the notice of the corporation. The question was whether the new work was or was not part of the outer boundary. He contended that it was.—Mr. Richard Slaughter, building inspector to the corporation, said that the upper part of the shop now projected beyond the boundary wall. There was a fascia board round the top of the building before the fire, and in consequence of it it became very charred. Witness told the foreman of the work that if this fascia board were removed the shop would have to be set back in a line with the bank. Witness suggested that it should be cased or pieced, in order not to bring the affair under the compulsory powers of the Act. The board, however, was subsequently removed.—Mr. Fred. John Williams, assistant in the office of the city surveyor, deposed to visiting the shop on June 19, with the late Mr. Josiah Thomas. By [Mr. Weatherly: He could not mention a single case in which, when a shop-front had been charred and the remains removed, the owner had been required to set back.—Mr. Thomas Henry Yabbicom, city surveyor, said that the building line he determined on was made by him on Sept. 14.—Mr. Weatherly submitted, in face of this, that no anterior plans made for this building line, or evidence as to Mr. Thomas's intentions to carry out certain ideas, was admissible.—Mr. Edwin Bailey, foreman to Mr. Harris, builder, said that he was in charge of the work of renovation at West-street.—Mr. W. L. Bernard, architect, deposed to having visited the premises, 23, West-street. As far as he could judge, the parts removed were parts of the shop front. He considered the parts removed were

parts of the outer wall.—Mr. Cowper Jones, architect, having given evidence for the prosecution, Mr. F. Weatherly, for the defence, said that an adverse result of that case would be a very serious thing for his client. That was a criminal proceeding, and if there was any doubt in the case they had to give the benefit of it to the defendant. The basis of the Acts rested on the fact of men making a vacancy on their land. Intention had also to be considered. When construing an act of taking down they had to look to the intention, and he contended that the same held with regard to burning down. Turning to the matter of the building line, Mr. Weatherly argued this point from the technical legal side, and said that the only building line applicable in this case was that made by Mr. Yabbicom in September. If this were admitted, then his client could not be called on to set back, for if he finished the building before the line had been decided on he could not be called on to pull down. The magistrates said that they considered that the intention at the time of the taking down was not primarily to alter the building, but to rebuild because it had come down in consequence of the fire. They dismissed the summons, the question of costs to stand over.

DISTRICT SURVEYORS' FEES FOR JUBILEE STANDS.—At Southwark Police-court last week, Mark Patrick and Co., builders, of Westminster Bridge-road, appeared to an adjourned summons for non-payment of £23 odd, alleged to be due to Mr. Bernard Dicksee, district surveyor, for inspecting Jubilee stands within the premises of Messrs. Day and Martin, Limited, Borough-road. The case was one of a large number of similar claims, a few of which were disposed of, while the majority stood over until the present action was decided. The defendants wrote to the complainant, "We decline to pay your preposterous fees. You never surveyed our seating at all, but sent a boy to look at the place; and then you made out an account from an imaginary survey, which is not correct." The complainant admitted that he did not personally inspect the stands, but sent a young man named Brown, who was not a qualified surveyor. He based his charges for "supervision," which amounted in many cases to 15s., for stands seating only seven persons, upon the schedule of fees allowed for inspecting buildings and other structures. The hearing was again adjourned. In reply to the magistrate, Mr. Philcox stated that the defence in another case of the same kind was that the stands were inspected by nobody at all, but the fees were charged all the same.

STATUES, MEMORIALS, &c.

TUNBRIDGE WELLS.—The memorial erected in Tunbridge Wells to the memory of the late Canon Hoare was unveiled on Friday by the Archdeacon of Maidstone. The site is a triangular piece of ground at the top of Culverden Park-road. The memorial, which rests on a granite plinth, consists of a base of dark Pennant stone, from which rises a Gothic structure, built of local sandstone from the Speldhurst quarry. The lower stages are square, with buttresses at the angles, and on the front is an enriched panel containing a medallion portrait of Canon Hoare sculptured in statuary marble. This medallion has been executed by Mr. Bridgeman, of Lichfield. Below this is a marble tablet within a carved border bearing an inscription. This part of the design is finished with a cornice and enriched parapet, below which runs a band of tracery. Above the parapet is an octagonal stage with panelled faces surmounted by crocketed gables. The four angles are emphasised by pedestals carrying figures of the Evangelists, and connected with the octagonal part by flying buttresses. The whole is crowned by a spire, with crochets on angles, and terminating with a foliated finial and bronze areas. The total height of the memorial is 40ft. The memorial was designed by Mr. J. Oldrid Scott, F.S.A., and has been carried out by a local firm, Messrs. Strange and Sons, the carving being by Mr. Arthur J. Tuttle, of Lincoln.

The town council of Great Yarmouth have adopted the recommendation of the Gorleston Pavilion Committee to the effect that the borough surveyor be instructed to prepare plans for erecting a hall, capable of accommodating about 1,200 persons, with reading-room and other necessary adjuncts, at a cost not exceeding £5,000.

The memorial to the Brothers Portal has arrived from Rome, and is about to be placed in position at the end of the south aisle in Winchester Cathedral. The monument is of marble and mosaic work. It commemorates Captain Melville Portal, and Sir Gerald Portal, G.C.M.G., the former dying in Africa, and the latter at home. Under the white marble arched canopy of the memorial, and occupying the chief space, is an angel with expanded wings in marble, holding in either hand a medallion bearing one of the portraits with inscription.

Our Illustrations.

NEW BUILDINGS ON THE ROSEHILL ESTATE, SOUTHPORT.

THIS drawing illustrates the principal front of an extensive block of buildings recently erected on the above freehold estate for Mr. J. Witham. Being situated in the centre of the town, and in the principal street, it was necessary in planning the same to utilise the site to the best possible advantage so that no valuable space should be wasted. On this account a new avenue, 20ft. wide, was formed (as shown on plan), connecting Lord-street with Anchor-street, this being intended originally for suites of offices only; but in execution a portion of same has been used for dwellings, this portion being increased to 24ft. in width. The Lord-street frontage (illustrated) is devoted to four large houses, after which are five lock-up shops with offices above, these latter being approached from the avenue. The Anchor-street frontage is devoted to five dwellings, but much smaller than those in Lord-street. The land in the rear is occupied by a clubhouse, consisting, on the ground floor, of spacious entrance hall and staircase, with conveniences, cloakroom, steward's room, kitchen, and a dining-room, 34ft. by 29ft. On the first floor is a clubroom, 34ft. by 29ft., with an ante-room, 24ft. 9in. by 10ft. 6in., and a committee-room, 16ft. 9in. by 16ft. 9in. The avenue buildings are three stories in height, the upper one being in solid timber framing, filled in with brickwork and finished in rough-cast cement work. Enfield Accrington red-pressed bricks, set in black mortar, have been used for the elevations, with Woolton red sandstone. The ornamental work to pediments and bay windows is in cement, modelled and cast by Mr. Gerhardt, of Liverpool, from the architect's designs. Mr. Nicholas Shaw, of Southport, was the sole contractor for the work, and the architect Mr. Francis P. Halsall, A.R.I.B.A., 4, Post Office-avenue, Southport. Quantities were supplied by Messrs. Hurrell and Taylor, F.S.I., of Manchester. The illustration is from the architect's drawing.

STATUARY AT THE NEW COUNTY COUNCIL OFFICES, WAKEFIELD.

THESE statuettes form a portion of the sculptural decoration of the new County Council offices at Wakefield, which are to be opened shortly, the niches being set in the piers of arcade to Bond-street. The building is very effectively decorated with a considerable amount of figure sculpture, five of the gables having allegorical bas-relief subjects, representing "Art,"

"Science," "Music," "Literature," and "Poetry," while over the main entrance is a series of panels with figures in relief of "Justice," "Progress," "Education," and "Hygiene," and in the niche above a statue in full relief of "Honour." The work has been carried out by Mr. W. Birnie Rhind, A.R.S.A., Edinburgh, the architects being Messrs. Gibson and Russell, 11, Gray's Inn-square, W.C.

THORNLIEBANK PUBLIC SCHOOL.

THE school buildings erected shortly after the passing of the Education Act, having been almost totally destroyed by fire in the spring of 1895, advantage has been taken of the opportunity thus given to remodel the plan and bring the school into line with present-day requirements. The value of the work left standing being estimated at £1,200, an effort was made to arrange the new plan so as to utilise this, and yet meet the approval of the Education Department. The extensions practically swept away the well-meant efforts to completely utilise what was left of the old work, and added something like £3,000 to the estimates. The plan of the school, which now shows accommodation for 616 scholars, has classrooms grouped round a central hall, and is a one-storied building with all floors on the same level. The boys' and girls' main entrances are from the public road; the infants' entrance on the west side may be used as an exit for the girls also. The boys have an exit on the east side to the higher playground, where their playsheds and latrines are situated. The cloakrooms and lavatories adjoin these latter exits, as also the rooms of the teaching staff, situated in a back wing north of the central hall. Under this wing is a basement entirely devoted to the boilers, engines, fan, &c., of heating and ventilating apparatus. The artificial lighting is by gas pendants, fitted with incandescent lamps. The style of architecture is English Gothic of the 16th century. The cost of school, latrines, and boundary walls, with janitor's house, inclusive of all furnishings, and exclusive of fees only, is about £9,000. Mr. W. G. Rowan, of Glasgow, is the architect.

PEEL SCHOOLHOUSE.

THIS illustration shows a design for a school and master's house at Peel, Isle of Man. The walls were to be built of local rubble, finished with white rough cast, and the roofs covered with green slate, the woodwork painted green. The effect of the exterior depends entirely on the grouping of the masses, and the only ornament is the modelled figures over the main entrance—a symbolical group representing children plucking the fruit from the Tree of Knowledge. The master's house was planned to contain accommodation for 20 boarders, and the school is designed for 80 scholars. Mr. M. H. B. Scott is the architect.

THE TOLBOOTH, DYSART.

THE architect will not find much to occupy his attention in this somewhat quaint Fifeshire town beyond a few harled houses on the seashore and the Tolbooth, which stands in the centre of the town, and was built in the year 1617. It was almost destroyed by an accidental explosion while occupied by Cromwell's soldiers as a barracks and magazine; subsequently it was used as a gaol.

FALKLAND PALACE.

THIS building, which has played so prominent a part in Scottish history, lies under the shadow of the Lomond Hills, and is supposed to have been begun by James III. or IV., but was not completed till the reign of James V. It is alike interesting to the architect and antiquary, and the student who pays it a visit will find ample scope for the use of his pencil. The peculiar mixture of the several styles strikes one as being somewhat incongruous. That portion which forms the subject of the sketch is the main entrance to the palace, and leads to a large courtyard, described as being in the Palladian style, and which is, unfortunately, still in a very ruinous condition, owing to a fire which occurred at the end of the 17th century. It is, however, undergoing restoration by the Marquis of Bute, the present owner.

OLD HOUSE, WHITCHURCH.

THIS old house, situated in the centre of a picturesque Buckinghamshire village, is one of several bits afforded the sketcher in the neighbourhood. No reliable information is to be obtained as to its history beyond the fact that it was at one time occupied by monks of the Cistercian Order, and rumour has it that it was once

connected by an underground passage with the castle of Hugh de Bolbec, distant about a quarter of a mile. The site of this castle, from which the masonry used in the more modern portion of the house was obtained, is still plainly discernible. An interesting feature of the house is its large cellars and dungeons.

TYRINGHAM HALL, CUDDINGTON.

TYRINGHAM HALL, a charmingly-ruinous old house standing close to the village church, has been for some time unoccupied. In its earlier days it was in the possession of the Tyringhams, and is now owned by Mr. J. Napier Higgins, Q.C., a relative of the original proprietors. A few years ago some fine old oak work was removed from the hall to a residence upon another part of the estate.

Aylesbury.

FRED. TAYLOR.

HOUSE, LITTLE SWITZERLAND.

THIS is a design by Mr. Baillie Scott for a stone house, near Douglas, the walls of local rubble, and the roof covered with stone tiles. On the entrance front the effect is concentrated on the main entrance, and broad spaces of unrelieved wall are introduced in the gables. On the garden front a slight departure from the symmetrical gives a domestic touch. The interior is designed in the same traditional character, with a liberal use of oak panelling. The corridor communicating with the drawing-room is broad and low and panelled, and, with the passage to the kitchen, keeps the hall free from the routes of servants or visitors. The drawing-room is designed in the Adams style, with broad white panels and a modelled plaster ceiling. The upper parts of the wall in the hall are finished with faced stone, and in the dining-room a frieze of embossed leather is introduced above the panelling.

NEW RESIDENCE, PARK AVENUE, WOLVERHAMPTON.

THIS house, of which we give view and plan, is approaching completion. The materials of which it is built are Ruabon bricks with red terracotta (J. C. Edwards's) for dressings. The framing, which is of oak, is left fine from saw, and the roof is tiled. Mr. Wm. J. Oliver is the architect, and the builders are Messrs. H. Willcock and Co.

FONT AND COVER, POYNINGS CHURCH.

SOME six miles to the north of Brighton, at the foot of the Dyke, lies the historic village of Poynings. The fine cruciform church, dating 1380-90, is of Transitional character, the features belonging rather to the Perpendicular period, and has been little altered or modernised, retaining much of its old character and fittings, including the quaint Laudian altar rails, Jacobean pulpit, rood-screen, and a simple, though very effective, font and cover, which is herewith illustrated. Until quite recently this church was most difficult of access, and of the many tourists who went to the Dyke few were able to undertake the tedious task of descending and reascending the hill; but now, since a "steep-grade railway" connects the hilltop and the valley, all lovers of old English architecture who go to the Dyke will thereby be enabled to pay this very interesting church a visit. H. C. PULLIN.

XVIII. XIX. AND XX. JERMYN STREET.

THIS block of buildings, now nearing completion, occupies the sites of Nos. 18, 19, and 20, Jermy-n-street. The elevation is of Portland stone, and the building is of fireproof construction throughout. The ground floor contains four shops, and there are two large rooms in the rear—on the ground floor and basement respectively—about 60ft. by 25ft., which are used by Messrs. J. Lyons and Co., Ltd., refreshment contractors, in conjunction with their Piccadilly premises. The upper part of this building is planned for use as bachelor's flats, each suite consisting of from one to three rooms, with bath, &c. The kitchen accommodation is on the top floor, and the building is fitted with hydraulic passenger lift. The contractors are Messrs. Thomas Welsh and Son, of Albert Works, Chatsworth-road, Stratford, E., and the designs have been prepared, and the building carried out, under the supervision of Mr. E. Keynes Purchase, architect, 11, Queen Victoria-street, E.C.

The new public buildings at Baldock were formally opened yesterday (Thursday) afternoon.

Engineering Notes.

DUDLEY.—On Saturday, at the town hall, Dudley, the Earl of Jersey and Colonel Boughiey, commissioners under the Light Railways Act, conducted an inquiry relative to the proposals of the British Electric Traction Company (Limited). It was explained that in connection with the existing Dudley and Stourbridge Tramway, it was proposed to make extensions from Dudley to Kingswinford, through Pensnett, from Kingswinford to Stourbridge; from Stourbridge to Kinver, and from Dudley to Cradley, through Netherton, Old Hill, and Cradley Heath. The promoters of the scheme were the British Electric Traction Company (Limited), who had a capital of £600,000, and who were not contractors, but investors. The total length of the lines would be 8 miles 5 furlongs 4.60 chains. They proposed to work the line by electricity on the overhead system. Mr. Sellon, the engineer, gave evidence on behalf of the British Electric Traction Company.

GREAT CENTRAL RAILWAY TO LONDON.—Just three years ago the Countess of Wharnccliffe cut the first sod of the new line to London at Alpharoad, St. John's Wood, which will afford the Great Central Railway Company independent access to the Metropolis. The construction of the line was let in six sections, one of the conditions in each case being that the work should be completed in two and a half years. The undertaking has been vigorously pushed forward, but its completion will probably not be realised until July or August next year. The northern section of the new line extends from Rugby, by the way of Leicester, Loughborough, Nottingham, to Annesley, where a junction is effected with the Great Central Company's existing line. Mr. E. Parry, of Nottingham, is engineer for this portion of the work, Messrs. Logan and Hemingway being the contractors. The southern division—that between Rugby and London—is under the engineering supervision of Sir Douglas Fox and Messrs. Francis and Douglas Fox, of Westminster, and the contractors are Messrs. Oliver and Son and Messrs. Walter Scott and Co. Ninety-one miles from Annesley, along the route of the new line, at Quainton-road, the Great Central trains will pass on to the Metropolitan Railway Company's system, and travel thence for a distance of about 40 miles, branching off at Finchley-road, and taking an independent course for a little less than three miles, thence to the Metropolitan terminus adjoining the Marylebone-road. That portion of the undertaking which lies in London is being carried out by Mr. Firbank, the contractor, under the direction of Mr. E. Wragge, the resident engineer. Along the section from Annesley to East Leake the contractors have made good progress. Especially is this so in regard to the extensive works which are being executed in Nottingham. For the purposes of the New Central station a vast amount of property has been demolished. The Great Northern Company's extension, from their present terminus in London-road to the New Central station, a distance of some 600 yards, is in a forward state. The line runs under a covered way along Thurland-street, emerging at Weekday Cross, the site of the old town-hall. Thence the metals are carried over a viaduct to the Midland Station, which is crossed by means of massive iron girders. The viaduct extends from here to the river Trent, traversing the densely populated Meadows district, the river being spanned by a bridge. From the Trent to the village of Wilford a huge embankment has been constructed, on which the permanent way is laid, and thence to East Leake the line passes through a hilly district. The company have had to erect a large number of artisans' dwellings on the northern side of the Central Station in Nottingham, and others will be built in due course. The goods yards in the Meadows are being speedily formed, and at the Carrington end of the city gasworks are being constructed. Considerable activity prevails at the present time in the neighbourhood of Loughborough. On the site of the town station several hundred men are engaged, whilst at Leicester and Rugby progress is being made with the line. In relation to the southern section of the undertaking, a considerable amount of earthwork has had to be done. At the present time about one-half of the permanent way has been laid. Five lines of metals will run into the passenger terminal station,

which is being constructed on an extensive scale. A goods warehouse is being erected, with a floor space of about 11½ acres. Engine works, a shunting-shed, and numerous sidings are in course of construction at Neadsen. More than half of the 3,960 yards of the new railway at the metropolitan end lies below the ground. The longest tunnel which is being made within the London area will be 37 chains in length. The company have had to erect artisans' dwellings to accommodate 3,000 people displaced by the operations of the contractors.

COMPETITIONS.

BIRMINGHAM.—Mr. William Henman, F.R.I.B.A., has written to the local Press declining to allow his name to be added to the half-dozen firms of architects who have been invited to send in competitive plans for the new Borough Lunatic Asylum. He says: "My name has been mentioned in connection with the above without my previous knowledge or sanction. Although I feel indebted to Mr. Councillor Stenbridge for his appreciation of my architectural efforts, and have long felt that it is far from just to many capable architects in the city that such marked preference should be displayed towards one firm, I am of opinion that it would be better if such questions could be fought out on broad grounds rather than over a special case like this, because I understand that Messrs. Martin and Chamberlain have for some time past been in close consultation with the committee, and have practically prepared plans, and it must be presumed by their recommending them that they meet their requirements; consequently, a competition now becomes a one-sided affair, in which I have no desire to take part, more particularly as there are members on the committee well acquainted with my architectural work. For reasons best known to themselves, they have not seen fit to invite me; and, as I have no desire to force myself upon them, I have requested Mr. Councillor Stenbridge to withdraw his notice of motion that my name should be included in the list of competitors."

LAXEY, ISLE OF MAN.—In a limited competition for the Primitive Methodist New School Chapel, the design of Mr. T. Taliesin Rees, A.R.I.B.A., architect, Birkenhead, has been selected. The building is planned with a central hall and five classrooms, divided by means of folding glazed screens, so that the whole can be converted into one large room capable of accommodating 500 persons. In the rear are kitchen, with cooking-stove, committee-room, heating-chamber, lavatory, &c. The materials will consist of local stone, cemented; the internal wood-work will be pitch-pine, varnished. The style will be Late Gothic, with traceried windows filled in with leaded lights.

LOWER BEBINGTON DRAINAGE SCHEMES.—Some time ago the urban district council of Bebington invited designs for a proposed new sewerage scheme, involving the diversion of the various outfalls now draining into the Bromborough Pool, offering premiums of £50, £35, and £20 for the schemes judged to be first, second, and third, according to the award of an assessor to be appointed. The award of the assessor appointed by the council (Mr. H. P. Boulnois, M.I.C.E., late city surveyor of Liverpool) has now been made, and premiums have been awarded upon such schemes in the following order:—First premium to Messrs. Beloe and Priest, 13, Harrington-street, Liverpool; second premium to Mr. H. Bertram Nichols, of 59, Corporation-street, Birmingham; and third premium to Messrs. Goodison, Atkinson, and Ford, of 11, Tithebarn-street, Liverpool. The proposed scheme is of importance, having regard to the development of the district, and particularly to the continued extension of Port Sunlight.

PAINTERS' CO.—A travelling studentship of £50 is offered by the Painters' Company for the encouragement of the study of decorative painting. The studentship is open to competition by students between the ages of 20 and 35 in any recognised school of art or other institution devoted to the study of applied art in any form, and situate within the limit of the larger Metropolitan postal area. Each set of designs sent in competition must bear the author's distinctive mark or motto (but not his name), and the title and address of the institution by which they are forwarded; they must also be countersigned by

the responsible officer of the institution. The set of drawings must be accompanied by a sealed envelope marked outside "Competition," and containing the author's name and address, with the mark or motto borne by the drawings. The drawings and envelope to be addressed to "The Clerks of the Painters' Company, Painters' Hall, Little Trinity-lane, London, E.C." Not more than two sets of designs may be forwarded for one competition by any one institution. The number and description of the drawings required of each competitor and other conditions may be obtained from the clerks of the company, Messrs. Pritchard, Painters' Hall, Little Trinity-lane, E.C., on application by letter, on or before the 1st day of December, 1897. Certificates of commendation may be awarded, at the discretion of the awarding committee, to works occupying the second and third places in the competition. Any competitor who may obtain the first award will be required to sign a copy of these rules and a declaration that he will, within the year 1898, proceed abroad for at least two months, and spend not less than six weeks in Italy, visiting such places as the committee may direct, and devoting himself to making sketches and notes of examples of coloured decorative art. He will at the same time be required to produce a certificate from the Institution which he represents that his general conduct has been satisfactory whilst a student there. All the drawings must be delivered at Painters' Hall on or before March 1. The carriage must be prepaid.

CHIPS.

At the Wesleyan Chapel, Hadley, Salop, last week, an organ built by Mr. J. C. Banfield, of Birmingham, at a cost of £700, was formally opened.

A new park was opened at Airdrie, N.B., on Friday. Of the 13 acres of land, eight have been presented and five purchased, and Mr. John Wilson, M.P., the new proprietor of Airdrie House, gave £1,000 towards beautifying the grounds.

The Corporation Hospital, Birkenhead, is being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves with descending smoke-flues, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The London County Council agreed, on Tuesday, to a scheme for the purchase, for £140,500, of a large block of property between Southampton-row and Kingsgate-street, owned by the Duke of Bedford, which is intended to be the beginning of a new public improvement between Holborn and the North-west of London. They also agreed to proceed with a subway for foot passengers under the Thames at Greenwich, the estimated outlay being £70,500.

Henry Taylor, 43, a carpenter, living at 1, Colville-road, Acton, was brought up, on remand, to the South-Western Police-court on Tuesday on a warrant before Mr. Marsham, charged with withholding books belonging to the Wandsworth Branch of the General Union of Operative Carpenters and Joiners, of which he was secretary. He was further charged with embezzling various sums of money belonging to, and falsifying the accounts of, the Union. He was committed for trial.

At Glamorgan Assizes (before Mr. Justice Grantham) on Friday, Samuel Watkins, a middle-aged man, described as a master builder, and also a member of the School Board, living at Merthyr, was charged with having, on July 13, "attempted to kill and murder William Harrington." Some men in prisoner's employ were drinking at a public house for some hours, and then went to him demanding a "sub." The allegation was that prisoner threw a hatchet at Harrington, striking him on the ear and neck, and felling him to the ground. The defence was that Harrington was a violent man who had been convicted of assault, and that prisoner acted in self defence. The judge said there was no evidence whatever on which a jury could convict, and a verdict of "Not Guilty" was returned.

The Bristol Corporation, at their meeting on Tuesday, elected, from a number of applicants, Mr. W. J. Steele, assistant to the surveyor of the urban district council of Tottenham, as assistant city engineer and surveyor, at a salary of £250 per annum, rising by £10 annually, to £300 per annum. A committee have divided the city into five districts, for the purpose of the city engineer's department, and two surveyor's assistants, in addition to the three assistants already employed by the council, were required to take charge of these districts under the supervision of the city engineer. To these vacancies Mr. McKenzie and Mr. Lashmore have been appointed, at salaries of £180 per annum, rising by £10 annually to £250 per annum.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

SCARBOROUGH MASTER BUILDERS' ASSOCIATION.
—The annual meeting of the above association was held on Wednesday week at the Albemarle Hotel, the chair being occupied by the president, Councillor James Bland. The annual report and balance-sheet were read and unanimously adopted. It was decided that the association should become affiliated with the Yorkshire Federation of Building Trade Employers. The officers for the ensuing year were elected as follows:—President, Councillor J. Bland; vice-presidents, Mr. J. Barry, Mr. J. Oates, Mr. Sinclair, and Mr. Morrison; treasurer, Mr. J. Jarram; secretary, Mr. R. H. Carr. It is proposed to hold an annual dinner in connection with the association, the first of these repasts to take place early in December.

CHIPS.

Notices have been issued for seeking powers for the construction of a light roadside railway on the electric overhead system, from the Finchley-road Station to Hendon and Finchley.

Mr. Robert H. Bicknell, an inspector of the Local Government Board, held an inquiry at the Town-hall on Wednesday last, respecting an application made by the corporation for sanction to a loan of £30,000 for electric lighting purposes. The details of the scheme were explained by Mr. Fox, the borough engineer, who has prepared the plans for the buildings. There was no opposition.

A new theatre is about to be built at the corner of Meadow-lane and Hunslet-lane, Leeds, from plans by Mr. Frank Matham, of London. The theatre will face Leeds Bridge, and the exterior will be constructed of terracotta. The building will be surmounted by a light-looking cupola tower. This will contain a water-tank, which will supply a sprinkling installation. The interior of the theatre is to seat 3,500 persons, and standing-room will be provided for another 1,500.

A public inquiry was held at the Bull Hotel, Dartford, on Thursday in last week, by the Light Railway Commissioners, as to an application made by the International Communications, Limited, for an order to authorise the proposed Dartford District Light Railway. Mr. Hubbard, engineer to the scheme, explained. The Earl of Jersey intimated that the commissioners had been prepared to recommend the provisional order that Railway No. 1 commenced at Dartford and was continued to Eynsford, where it practically joined the London, Chatham, and Dover Railway. Line No. 2 deviated from that at Wilmington and went to Swanley Junction, whilst Railway No. 3 was an extension from Farningham of Railway No. 1, and went into the high lands of Kent.

In the Queen's Bench Division, on Friday, a jury awarded Mr. Thomas Tregallas, surveyor and estate agent, of 12, Hobart-place, Eaton-square, £1,250 damages against the London County Council for the loss of his left eye, caused by the branch of an overhanging tree in Grove-road, Victoria Park, striking him while he was on the top of a tramcar. The Lord Chief Justice, however, entered judgment for the defendants, holding that plaintiff could not recover. The cases relied on by the plaintiff were "Cowley v. Newmarket Local Board," "Sanitary Commissioners of Gibraltar v. Orfila," "Municipality of Pictou v. Geldert," and "Saunders v. Holborn Board of Works." For the defence it was contended that the doctrine of non-liability of a public body for non-feasance applied only to highway authorities and sewerage authorities, and in support of this contention counsel cited "Cowley v. Mayor of Sunderland," "Glossop v. Iseworth Local Board," "Gilbert v. Trinity House," "Borough of Bathurst v. Macpherson," "Thompson v. Mayor of Brighton," and "White v. Hindley Local Board."

The Royal Commission on the London water supply held their first sitting for the taking of evidence on Monday. Lord Llandaff presided. Mr. H. L. Cripps, who has been the Parliamentary agent of the London County Council and their predecessors since 1871, was the first and only witness. He stated the attitude of the County Council on the question, and gave evidence to the effect that there were special reasons why the purchase of the water companies' undertakings was expedient in the case of London as distinguished from provincial towns. He said the objects of Parliament in the legislation that had taken place were to improve the supply and reduce the charges of the old companies; but these objects had been frustrated by the combinations entered into by the companies outside their statutory powers. He was convinced that purchase would result in a considerable annual saving to the people of London. The witness's evidence was still proceeding when the Commission adjourned till December 6.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 6d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 6d. (or 33fr. 30c.) To India, £1 6s. 6d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 6d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and SIXPENCE for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLII., XLIII., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., LI., LII., LIII., LIV., LV., LVI., LVII., LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—P. T. C.—L. A. U.—C. and Co.—G. B. D.—I. C.—L. T. D.—S. B.—E. S.

Correspondence.

THE UNIVERSAL TEE-SQUARE.

To the Editor of the BUILDING NEWS.

SIR,—Since the illustration and my letter appeared in your journal, I have had many inquiries for particulars concerning same, and one of my correspondents, Mr. C. McArthur Butler, M.S.A., Salisbury Chambers, Boscombe, Bournemouth, has decided to take up and explain the instrument, and desires all communications concerning same to be addressed to him.

Thanking you for the insertion of my letter and the illustrations,—I am, &c.,

W. C. STANDAGE.

Erdington, Birmingham, Nov. 10.

SEPTIC TANK ACCIDENT.

SIR,—I notice with much regret in your issue of the 19th inst. that a serious accident has been experienced by Mr. A. Creer, the city engineer of York, during an inspection of the septic tanks in connection with the sewerage system of Exeter.

The statement, however, from whatever source it may have emanated, that I have recently suffered from a similar accident is incorrect, and should apply to my friend Mr. J. F. Peddie, of Belfast, whose services here as a sanitary engineer have been most useful, and for whose recovery I am exceedingly glad.

At the same time, I would recommend the authorities in Exeter to take immediate steps to prevent the possibility of a state of affairs recurring that has already laid aside from active service two eminently useful members of the engineering profession in the discharge of their duty.—I am, &c.,
Jos. C. BRETLAND, City Surveyor.

Intercommunication.

QUESTIONS.

[11846].—**Blisters.**—I thank your correspondent "H. C. S." for the information he has given as to the cause, and shall be glad if he will kindly say the best method to adopt to prevent a recurrence!—W. J. L.

[11847].—**Lap to Tile Roofs.**—As no answer has been given to this question (asked some weeks ago), I will repeat it. Is the "lap" measured from the nail-hole, or from the top of the tile? It would make a substantial difference in the quantity of tiles used, as well as in the weatherproof properties of a roof. Answer from experienced correspondent will oblige.—C.

[11848].—**Temporary Structures.**—Should be glad to hear of any textbook on the construction of temporary modern buildings suitable for holding large assemblies.—SURREY, Richmond Hill.

[11849].—**Vinery.**—I have a vinery with a back formed of 1½ in. T. and G. boards instead of a wall; dimensions, 14ft. by 11ft. high. Can any of your readers suggest a plan of treating it so as to get a nice effect and to take away the appearance of boards, and also to prevent it rotting with the damp? I thought of a cement wash, but am given to understand it would not stick to the boards. Covering it with virgin cork would have a nice effect, but is objectionable on account of insects finding a secure lodgment behind. Any suggestion would be thankfully received.—C. D. J.

REPLIES.

[11833].—**Painting of Galvanised Sheet.**—I note the remarks of your correspondent re reply to query 11533 that, in his experience, acid or copper salts set up a destructive chemical action on the zinc. Such is not the case, except to a very slight degree; the destructive action only continues while the acid mixture is in contact with the zinc, and as this is only a few minutes, the corrosive or erosive action of the acid has not time to exert but a trifling action on the surface of the zinc—just sufficient, in fact, to roughen the surface, and thereby better enable the paint to adhere. The chemical action of the acid or copper preparation has other functions, however, which actually preserve the surface of the zinc from atmospheric or chemical influences. Thus, in the hydrochloric acid compound, all the acidity of the acid has been neutralised by the addition to it of the metallic zinc, whereby the acid has become converted into chloride of zinc, which is one of the most powerful disinfectants known, and antagonistic to all organic changes (such as would be set up by the drying of the oil medium with which the paint is mixed). By thus coating the surface of the metallic zinc with a film of zinc chloride, the metallic surface is preserved against the erosive action of the fatty acids that are disengaged from the oil vehicle in the paint during the drying process of the latter. In the case of the copper preparation, the surface of the metallic zinc is converted into a thin film of sulphide of zinc or oxide of copper, both of which films prevent any further chemical or atmospheric reactive changes. The oxidation of zinc surfaces is not destructive to the metal like oxidation of iron surfaces; for with the latter metal the oxidation proceeds by a catalytic action, by imbibing oxygen from the air or any other available source, and thus the erosive action of the iron proceeds until the solid metal has become converted into pulverulent oxide.—H. C. S.

WATER SUPPLY AND SANITARY MATTERS.

CHIRBURY.—Waterworks have recently been constructed at Chirbury by the Earl of Powis. The supply has been drawn from the Spout, a spring not far from the village. Lord Powis has borne the whole of the expense of construction, which amounts to about £1,000. The spring from which the supply is taken yields in dry weather 7,000 gallons per day. Near its outlet the water passes into a small chamber, and from thence goes through a screen into the pumping well. It is then raised by means of a wind engine into the reservoir, which is situated on a knoll overlooking the town, a distance of some 600ft. The engine is connected with two twin pumps. With one set of pumps going the average quantity of water raised will be about 6,000 gallons per 24 hours, but it is only proposed to work the work the engine an average of eight hours per day. The reservoir is constructed of blue Ruabon bricks, with coping of Grinshill freestone, and has a holding capacity of 45,000 gallons—15 days' supply. The whole of the work, with the exception of the erection of the pumping machinery, has been carried out by the estate workmen, under the superintendence of Mr. W. Forrester Addie.

EDINBURGH.—Notices have been given by the Edinburgh and district water trust of their intention to promote a Bill in Parliament in the ensuing session. Power is sought to raise the waste weir of the Gladhouse Reservoir by 1ft. or thereby, which will have the effect of increasing the storage of the pond by one hundred million gallons of water. Power is also sought to authorise the laying of a culvert and line of pipes from Gillycubdeanwell, which is about two miles nearer Edinburgh than Gladhouse. This well is supplied by a large conduit or tunnel from Gladhouse, and is capable of bringing to it three to four million gallons of water a day more than the pipe from it to Alnwick-hill can carry away. It is to utilise that water for the service of the city that a new line of pipes is proposed.

Our Office Table.

THE ninth congress of archaeological societies will be held at the rooms of the Society of Antiquaries on Wednesday morning next. Viscount Dillon, president of the Society of Antiquaries, will take the chair. Among the subjects for debate are:—Catalogue of Effigies; the Best Form of Index for Transactions of Societies; the Annual Index of Periodicals; and a report on the proposed Catalogue of National and Family Portraits. A report will be read on the Formation of the National Photographic Record Association. The Catalogues of Local Museums and the Ancient Monuments Act will also be discussed. If time permit, short papers will be read on "How to Preserve Antiquities," by Mr. George Payne, of Rochester, and "How to Excavate," by Mr. W. H. St. John Hope. The annual dinner in connection with the congress will be held at 7 p.m. at the Holborn Restaurant.

SIR JOHN WOLFE BARRY, president of the Institution of Civil Engineers, specially visited on Monday evening the Trades' Technical School, carried on by the Company of Carpenters and other City guilds connected with the building trade, in Great Titchfield-street, Oxford-street. Among the others visitors present were Mr. J. H. Gibbins, the Master, Mr. J. C. Preston and Professor T. Roger Smith, F.R.I.B.A., Wardens, and Mr. S. W. Preston, the clerk of the Company of Carpenters, Dr. W. Garnett, Professor Banister Fletcher, F.R.I.B.A., chairman of the school, the Hon. R. Parsons, M.I.C.E., and representatives of the following companies which are associated with the Company of Carpenters in carrying on the school:—The Joiners' Company, the Painter Stainers' Company, the Plasterers' Company, the Tylers' and Bricklayers' Company, and the Wheelwrights' Company. The party visited the various workshops of the school, in which the classes were engaged from 7.30 to 9.30 p.m. The fifth session of the institute has now been started, and, though the school commenced in a small way, yet the great need of the method adopted of training the craftsman is shown by the fact that during the session just completed 378 individual students attended the various classes. Students who go to the school are set to work, none but actual craftsmen are admitted, and no social entertainments or relaxations are permitted, as is the case in other training schools.

The announcements of railway schemes for the ensuing session of Parliament do not promise many extensive proposals. The Wirral Railway Company propose to make a railway from West Kirby to Rhyl, bridging the river Dee near its mouth. The line is to cross the golf links to the Dee shore, where an extensive embankment is to be constructed. Thence a bridge ($3\frac{1}{2}$ miles in length) is to cross the river to a spot midway between Mostyn and Point of Ayr, the line being carried on to Trevaelod and along the Dee to Rhyl. The railway journey from Liverpool to Rhyl is now 50 miles, while the projected new bridge over the Dee will reduce it to 24 miles. The London and South-Western Railway Company will apply for leave to bring in a Bill to authorise them to construct a new railway from Exmouth to Budleigh Salterton; to widen and improve the main line in the parish of St. Mary, Lambeth, between the western side of the Wandsworth-road and Homer-street; and to construct a bridge over the Colne Brook in Wyardisbury, Eton. The Bill will also contain clauses to extend the period limited by the company's Act of 1893 for completing the widening of the lines leading into their Waterloo Station, and to provide for the removal of the church and schools of All Saints' district, in St. Mary, Lambeth, annexing the district to the adjoining parish of St. John, Waterloo-road. A company is sought to be incorporated to construct a direct railway between Windsor and Ascot.

The South-Eastern Railway Company will seek Parliamentary powers next session to construct a new connecting railway from Lewisham to Orpington, passing through Lee, Bromley, and Chislehurst. Powers will also be sought by the Cranbrook and Paddock Wood Railway Company to extend their line from Branchley to Snargate Junction, near Appledore, on the Ashford and Hastings branch of the S.E.R. system, thus forming a more direct route between London and Dungeness. A light line of railway is proposed to serve Mid-Essex. Starting by a junction

with the terminus of the Great Eastern Railway's "Forest" branch at Ongar, it is carried through Dunmow to Yeldham, a district at present very difficult of access by rail.

THE Great North of Scotland Railway Company will seek power to widen and improve their railway between Keith and Duftown, between Longmorn and Elgin, to widen and improve the Elgin and Lossiemouth line, and to widen and improve a portion of the Buckie Extension Railway. The Bill will also provide for widening the Deeside line between Park and Banchory; also the portion of the Fraserburgh branch railway from Kessock Bridge to the terminus. The Bill will provide, further, for the extension of the bridge which carries Castle Terrace over the railway at Waterloo Station, Aberdeen, and for some street alterations in that city.

WITH reference to the proposal of the London and North-Western Railway Company to make a deviation of their line near Shap, the fact may be recalled that when the Lancaster and Carlisle line was first mooted in 1841 several projects for overcoming the difficulties of Shap Fells were submitted to the Government Commissioners. Seven alternative routes were suggested. The one by Long Sleddale and Haweswater was the shortest, with the lowest summit level; but in consequence of a tunnel being required of a nature then impracticable, the commissioners abandoned it. The next preferable line in point of distance was that by Shap; but a tunnel would have been required one and a half miles in length, through whinstone on the south side and limestone on the north, with a summit level about 120ft. higher than that by Long Sleddale. The Orton line would have been nearly one mile longer than the Shap line, with a tunnel one mile and a quarter in length, but had the advantages of a lower summit by 70ft., better gradients, and favourable strata for tunnelling. The other lines, by Sunbiggin, Tarn, Smardale, and Ravenstone-dale, and the valley of the Rathay to Sedbergh, did not require tunnels; but the summits were higher, and their lengths greater by seven to nine miles. The commissioners did not enter on their merits. The route which the promoters proposed to adopt came from Lancaster down the Kent Valley, and, after passing near Kendal, struck eastward, coming northward by way of Orton to Penrith. That was abandoned, however, in favour of the present route.

IN the ensuing session the London County Council will apply for a Bill to authorise them to construct and work a tramway over Westminster-bridge, and to make junctions with the existing lines of the London Tramways Company (Limited) and of the South London Tramways Company. The Council also notify their intention of applying for a Bill authorising them to construct tramways in Holborn, Clerkenwell, and Islington. It is proposed to commence one of the lines by a junction with the North Metropolitan tramway in Clerkenwell-road, opposite the Holborn Town-hall, and to proceed thence along Rosebery-avenue, into and along St. John-street-road, and to complete it by a junction with the existing tramway opposite the Angel, in High-street, Islington. Another short line will commence by a junction with the existing North Metropolitan tramway at the termination in the Theobald's-road, pass thence in a westerly direction along this road, Vernon-place, the south side of Bloomsbury-square, Hart-street, and Bury-street, and terminate in the latter street, near the west end of Silver-street. A third line is to commence by a junction with the existing North Metropolitan tramway in High-street, Shoreditch, at or near the western end of Bethnal Green-road, pass thence into and along this road, and terminate in Cambridge-road by a junction with the existing line near the east end of the Bethnal Green-road.

AFTER a long discussion and divisions, the City Court of Common Council adopted on Tuesday an important report of the Bridge-house Estates Committee relative to the mode of dealing with some 80 premises in Finsbury-circus, West-street, Finsbury-pavement, Albion-place, London-wall, and Bloomfield-street, at the expiration of the present leases at midsummer, 1899. The present rental received from the property is £3,456. On the recommendation of the committee it was decided that a road 30ft. wide shall be carried through from Albion-place to West-street, that the premises in Finsbury-pavement and the buildings at the rear shall be pulled down, and the site let on building lease for 80 years by

public auction; the remainder of the area is to be divided into four blocks and dealt with in a similar manner at such times subsequent to the letting of the first block as may seem advisable, and with a minimum of inconvenience to the present occupiers. When so dealt with, the ground-rents to be created will exceed £20,000 per annum.

ON the 1st of January next, a new Public Health Act of 196 sections comes into force in Scotland, repealing all former legislation, and making various entirely new enactments on the subject with which it deals. A large part of the Act is only a repetition of the provisions of the Public Health Act of 1867, but there are many alterations and extensions of the provisions of the Act in 1867 in that of 1897. The Act of 1867 and five amending Acts are all repealed, and Scotland starts on 1st January, 1898, with a new code of Public Health. Part I. deals with authorities for the execution of the Act. Part II. relates to sanitary provisions, including "general nuisances," "offensive trades," and "cleansing and scavenging." In Part III., the "general prevention and mitigation of disease" of an impetuous character is attempted, and under its clauses wide powers are bestowed on local authorities. The "prevention of epidemic diseases" is the aim of Part IV., and "the regulation of common lodging-houses" of Part V.; while Part VI. makes rules with regard to sewers, drains, and water. Under Part VII. are grouped rating and borrowing powers; under Part VIII. powers for the compulsory acquisition of land by local authorities, and Part IX. treats of legal proceedings. The establishment of port sanitary authorities is dealt with in Part X.; while "miscellaneous" matters are sought to be gathered within the folds of Part XI., the concluding section.

ON Saturday afternoon, at the Alexandra Hotel, Dale-street, Liverpool, a complimentary luncheon was given to Mr. H. Percy Boulnois, M.Inst.C.E., who has recently resigned the position of city engineer, building surveyor, and surveyor to the corporation, and in the course of the proceedings handsome presentations were made to the guest of a silver tea and coffee service, designed after an antique pattern of the Queen Anne period, together with tea-tray, *repoussée* silver bowl, and an illuminated framed address on vellum. Mrs. Boulnois was also the recipient of a toilet silver service, inclosed in a morocco leather case. Several other presentations were made to Mr. Boulnois on behalf of the employees of the corporation. In acknowledging the gifts, Mr. Boulnois mentioned that since deciding to commence practice in London he had accepted an important post under the Local Government Board.

AT the half-yearly meeting of the Wembley Oak Tower Company, the ground landlord of Wembley Park, held on Wednesday, Captain Francis Pavy, the chairman, said that the future of the estate had given them no anxiety, but their difficulty had been with the company which had partly erected a tower on the land which they had leased to them. This company, which was known as the Tower Construction Company, was already in arrears with its rent to the extent of £6,000, and he saw very little chance of getting any of that sum. If the tower had been finished he had no doubt it would have paid; but it was now quite clear that the tower would never be completed. Something would have to be done very shortly, and, in the mean time, the board had decided to take immediate action in the direction of building over the estate. With this object in view they had already instructed their architect to prepare a report, and they intended to erect one or two houses as a specimen of the class of property they would allow to be built. A discussion arose as to the course to be taken with the Tower Construction Company. It was strongly urged that this company should be "cleared out of the way," so that the development of Wembley-park might proceed unhindered. It was decided to invite shareholders to confer with the directors as to the steps to be adopted.

Mr. J. Romilly Allen, F.S.A., has been appointed Yates Lecturer in Archaeology at the University College, London, and intends to give a course of eight lectures in May and June next year on "Celtic Art and Its Developments." Mr. Romilly Allen delivered a course of Rhind Lectures for the Society of Antiquaries of Scotland some time back.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institute of British Architects. Business Meeting. 8 p.m.
Leeds and Yorkshire Architectural Society. "Stained Glass, Mediaeval and Modern," by Stephen Adams. 7.30 p.m.
Society of Arts. Cantor Lecture No. 1, "Guttapercha," by Dr. Eugene F. A. Obach. 8 p.m.

TUESDAY.—Institution of Civil Engineers. "The Law of Condensation of Steam," by Hugh L. Callendar, F.R.S., and J. T. Nicholson, B.Sc. 8 p.m.
Auctioneers' Institute. "Practical Application of the Principles and Laws of Dilapidations," by Henry Bushell, F.S.I. 8 p.m.

WEDNESDAY.—Congress of Archaeological Societies, Burlington House, W. 11.15 a.m.
Royal Archaeological Institute. "The Omphorion and the Pallium," by Dr. Wickham Legg, F.S.A.; and "A Blooming on Coniston Lake," by H. S. Cowper, F.S.A. 4 p.m.
Society of Arts. "The American Bicycle," by Prof. Leonard Waldo, D.Sc. 8 p.m.
Edinburgh Architectural Society. "Notes on Edinburgh Buildings and Monuments," by Prof. G. Baldwin Brown. 8 p.m.

FRIDAY.—Architectural Association. "The Planning of High Schools and Endowed Schools for Girls," by J. Osborne Smith, F.R.I.B.A. 7.30 p.m.

THE ARCHITECTURAL ASSOCIATION.

DECEMBER 3rd, ORDINARY GENERAL MEETING, No. 9, Conduit-street, W., 7.30 p.m. Mr. J. OSBORNE SMITH, F.R.I.B.A., on "THE PLANNING OF HIGH SCHOOLS AND ENDOWED SCHOOLS FOR GIRLS," illustrated by Lantern Views.
E. B. CARVILL, Hon. Secs.

CHIPS.

A font has just been sent out from Messrs. Harry Hems and Sons' studios, Exeter, to the parish church of St. Andrew, Grenada. It was designed by the rector of that West Indian parish, the Rev. R. Medley Fulford, formerly the principal of the firm of Messrs. Fulford, Tait, and Harvey, architects, of Exeter. Early English in character, the octagonal bowl is of Caen stone, the shaft of red Corsehill, and the step of brown Portland stone.

Two stained-glass memorial windows have been placed in the Unitarian Christian church at Newport. The one presented by Mrs. Chatfield Clarke and family, in memory of the late Mr. Thomas Chatfield Clarke, F.R.I.B.A., of Bishopsgate-street Within, E.C., and Newport, is a beautiful representation of "The Good Shepherd," and the other, the subject of which is "Christ blessing the little children," is in memory of the late Mr. and Mrs. Abraham Clarke. The work has been carried out by Messrs. Campbell and Smith, of Oxford-street, W.

Further revelations as to the late surveyor to the urban district council of Eastleigh, J. Evans, came out at the last meeting of that body. Among other letters read was one from Mr. H. J. Weston, of Southampton, stating that nearly the whole of the plans prepared in connection with the proposed new offices, for which Evans had taken full credit, had been carried out by himself. Under the circumstances, he asked the council, as the work had taken him some weeks, to be kind enough to make him a grant, and also offered his services as architect. The clerk said Mr. Weston had no one to blame but himself. He thought they should now throw the plans open to competition. It was agreed that the resolution approving of the plans be rescinded.

In the case of Alfred Nicholas Eastwell, of Caxton-road, Mayes-road, Wood Green, N., builder and decorator, the order of discharge from bankruptcy has been suspended for two years ending Oct. 19, 1899.

The urban district council of Springhead, near Oldham, have instructed Mr. Gilbert Wilson, C.E., 10, Nevill-street, Southport, to prepare a report and estimate of a proposed new water supply to the district of Austerlands.

Owing to the interference of the Masons' Union, Sir John Jackson has found it necessary to obtain a large proportion of the granite needed for the Keyham extension works, amounting in all to nearly 3,000,000c.ft., from Norway, in place of from the neighbouring quarries in Cornwall, as he had originally intended. The men, or rather their leaders, have now given way; but the contracts for a very large supply from Norway had already been signed.

The Marquis of Bute is about to restore the Castle of Sanquhar, in Dumfriesshire.

The River Tyne Improvement Commissioners decided at their last meeting to appoint Messrs. Coode, Son, and Matthews as engineers for the reconstruction of the North Pier at a remuneration of 5 per cent. commission on the works carried out.

Trade News.

WAGES MOVEMENTS.

LIVERPOOL.—A conference has been held between members of the committee of the Master Builders' Association and representatives of the operative plasterers with a view to the settlement of the dispute which has existed for a considerable period in connection with the trade. Mr. James Woods, president of the Master Builders' Association, occupied the chair, there being five other members of the committee at the conference, and the operatives were also represented by six of their number. The situation attaching to the strike and the demands of the men was discussed in an amicable spirit for a considerable time. No result, however, was arrived at, inasmuch as it will be necessary to lay the whole of the points in dispute before a general meeting of each party to the issue. It is anticipated that these meetings will be held at an early date, and a hope is expressed that the result will be such as to bring to a close a prolonged dispute, which has greatly hampered the progress of the erection of public buildings in various parts of the city.

Sir Benjamin Stone, M.P., has now handed over to the British Museum authorities the first two sections of his Parliamentary photographs, each consisting of 100 pictures, for the new National Photographic Record department in that institution. The present groups comprise photographs taken on the terrace of the House of Commons of exactly 100 members; and a similar number of views of the most interesting features in both Houses—such as the Throne, the Speaker's Chair, the Peers' Library, the Commons Lobby, and Westminster Hall.

A portrait of Miss Bishop, principal of the Royal Holloway College, painted by Mr. J. J. Shannon, A.R.A., was unveiled on Saturday by the Bishop of Winchester in the college picture gallery, before a large assembly of past and present students.

The new flood channel which the Thames Conservators have constructed through the lock island at Teddington, between the lock and the weir, was formally opened by Sir Frederick Dixon-Hartland, M.P., on Monday. The channel is 80ft. in width, and the sill is 6ft. 6in. below the highest flood-water mark of recent years, so that in the event of any abnormal rise in the river above the weir the water will pass away much more quickly than heretofore, and the flooding of the banks will be proportionately abated.

The work of demolition in connection with the frontage of Drapers' Hall, Throgmorton-street, is being proceeded with. The alteration will in no way affect the courtyard, or, indeed, the internal arrangements of the hall. The marble staircase has been removed, and when the new work is completed the staircase will be situated in the centre of the building. The architect is Mr. T. G. Jackson, R.A., from whose plans a stone building will be erected facing Throgmorton-street. The building will be let as offices.

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2239.

FRIDAY, DECEMBER 3, 1897.

COMBUSTIBLE BUILDINGS.

CAN they be made fireproof? This is the question which naturally occurs to every architect and engineer after the calamitous fire of last week in the City. In the presence of so large an area of devastation—measuring 200 yards by 100 yards—as that between Aldersgate-street and Red Cross-street, one feels abashed at the mere dimensions of the catastrophe, and the rapidity with which the fire spread over such an area. If we do not know positively what are the conditions of a fireproof building, we at least can see what are those of a combustible building. We have at least learned one thing, and that has been more than once suspected—that a warehouse may be constructed on so-called “fireproof” principles, and yet be as vulnerable as a wooden structure under a fierce fire.

Another very important thought is that the catastrophe will suggest serious reflections as to our methods of construction, and affords an opportune occasion for reviewing the whole question of the fire-resisting building of warehouses and business premises in crowded cities. It is quite certain that our methods—good in themselves—have not taken into account the way in which fire attacks a structure; that, in fact, we leave many loopholes and apertures through which fire can pass easily. Patentees and inventors have assumed a certain mode and action of fire, or a certain duration, and have imagined that if they protect their iron floors and columns, that is all that is required. Recent instances in this country and in America have shown that architects and engineers have not reckoned with other equally urgent conditions.

How 17 acres of buildings, many of them substantially constructed, though, alas! many of the jerry-built kind, could have fallen before the devouring element in the time till everything combustible had been destroyed is simply surprising. Engines, water, and firemen were in abundance, and yet the flames spread with astonishing rapidity, till there was nothing else to burn. The Brigade men nobly did their duty in arresting further damage to adjoining properties, but they seemed to be powerless to check the buildings involved till the flames spent themselves from lack of combustible fuel. Given a densely packed area of buildings with plenty of combustible materials within them, and our experience has been that a fire in one of the premises, unless speedily extinguished, involves the whole area.

But the question in its more particular aspect divides itself under several heads. First, as to the extent of the risk. The unit must determine this, and the unit is a building bounded by incombustible walls. If these are vulnerable to fire, the mischief extends, and other properties become involved. The extent of the risk is determinable, then, practically by the distance from one sound party-wall to the next, and may embrace the whole range of warehouses with party-walls between them; whereas it should be confined to one building or the distance between the two party-walls. As to front and back and other external walls, which are generally pierced by windows, there is equally an element of danger when a fire rages within and the street is narrow or the areas in the rear are small; but this danger can sometimes be controlled by well-equipped fire-extinguishing appliances,

so that for practical purposes the question is confined to party-walls and to floors and roofs. If the fire can be confined laterally by walls, and also in a vertical direction by fire-resisting floors of steel joists and concrete, it can scarcely obtain those dangerous proportions which render a number of warehouses on fire so difficult a matter to grapple with. The extent of the combustible area or space is therefore an all-important matter for consideration; the smaller we can make this unit the safer. The recent London Building Act has been framed on the principle of limiting the cubical extent of buildings, and it distinctly enacts that “no building of the warehouse class shall extend to more than 250,000c.ft. unless divided by party-walls in such manner that no division thereof extend to more than 250,000c.ft.” and it is further provided that no addition shall be made to any building of this class, so that its cubical contents shall exceed that number of feet. How far these provisions were enforced in the buildings lately destroyed we do not know; some of the warehouses were very old, and therefore were built before the new Building Acts came into operation, and probably few of them had not been altered either in one way or another by additions, or had not been re-divided by inner walls, so that the latter provision, introduced only in the Act of 1894, could not have been fulfilled. The inquiry will, no doubt, reveal more of the facts as to construction than we already know, and it would be very useful to find out whether any of the warehouses burnt out contained a larger cubical extent than here enacted, how many, in fact, contained so much as 255,000ft., or even the previous limit of 216,000c.ft.; and if any of the party-walls were really constructed within the meaning of the Act. Many of them, no doubt, had been tampered with, and openings made in them for extension of accommodation without proper fireproof doors.

The destructive fires at Pittsburg and Chicago of recent date have pointed to certain defects in the construction of buildings of this class. The construction of the Horne Store Buildings in the former city has been fully described in technical journals, and teach important lessons. The store was constructed on so-called fireproof principles; it illustrated several methods and forms of fireproofing materials, and was filled with dry goods very combustible; the windows were large, but unprotected by shutters or sprinklers; the floors were supported by steel columns made of Z-bars and plates, and the iron framework was heavy, the box girders 24in. deep, with double 22in. web-plates; the beams all 15in. deep, carried on brackets riveted to side of box-girders; the front and back walls were self-supporting; the lintels on most floors were close to the windows, and exposed to the fire; the building had openings in the centre of the floors. Further, the iron girders and floors were protected with ceilings of light cellular blocks of fireproofing of hard-burned material. The floor arches were carried on skewbacks, and the columns covered with tile 2in. thick, having a hollow space. Every precaution which modern construction suggests was taken. But the hollow floors formed flues which conducted the draught and increased the action of the fire. Two things were made clear. It was proved that plastering will not prevent the heat from charring wood behind it; that large windows, if not protected by fire-resisting shutters, are one means by which fire can easily spread from one building to others opposite or near. The protection of windows to prevent the heat from breaking the glass is therefore one of the essentials of preventing the spread of fire to adjacent buildings. The open shaft in the centre of the buildings is also condemned as uniting several floors and making them more dangerous than if the space was in one. As to fireproofing

materials, it has also been proved that porous protecting materials are superior to hard-burned clay. It is suggested, also, that porous coverings like that of sawdust and clay, inclosing the iron columns with a hollow space, and floor arches and flange protection of the same kind, will stand heat and water without material injury.

These are a few of the lessons learned after a careful observation of great fires in cities of the States. And they apply with equal force to the buildings in the City of London which were destroyed by fire the other day. In many cases the iron construction was of a like kind, but unprotected; and the second schedule of the Building Act, 1894, which provides that timber and iron are to be incased in “plastering in cement, or other incombustible or non-conducting external coating” was, of course, not followed, nor probably the other equally desirable rule that allows a space at each end of an iron bressummer to allow for expansion.

The correspondence which has been published in the *Times* refers to a few of these defects. Mr. Wm. Woodward shows that the Building Act of 1894 has one of its objects to render buildings more fire-resisting, and he instances the second schedule, which provides for encasing timber and iron in plastering or some incombustible coating. If this coating had been applied to the iron in the buildings in the City, probably less destruction would have occurred. A deep girder, supported on good solid brick piers is undoubtedly safer construction than iron columns as supports, especially if the girder is encased in plaster. But we certainly believe in the resistance of timber, if solid. Solid oak or teak beams have fire-resisting properties, and are certainly safer than unprotected iron rigidly fixed. Another correspondent draws attention to the unreliability of so-called fireproof buildings, and to the fact that, as an eye-witness of the conflagration, he noticed that in “nearly every case the fire commenced at the roof, and spread downwards, except those buildings which were opposite a burning structure, in which case the premises caught fire through the window-frames getting alight and shivering the glass.” The warehouses in Well-street and Hamsell-street stood back to back in contact with each other; they were tall buildings with large windows and skylights, and thus constituted one building as far as risk was concerned. The windows, in fact, immensely increase the danger of a fire spreading; they should, therefore, be protected by light iron or other fire-resisting shutters, and the skylights should be also protected outside. With the aid of asbestos and other non-conducting plastering on metal lathing, solid wood floors on concrete, proper iron or oak doors in brick walls and over lift openings, brick-walled staircases and escape ladders, automatic water-sprinklers fixed in lintels and on the upper floor, the rapid spread of a fire might be delayed or arrested. These are points which ought to receive attention when the proposed amendment of the Building Act next Session is made. The district surveyors also ought to have certain optional discretion given them in dealing with buildings. A store of combustible matter in connection with shelving of wood, match-boarded walls and ceilings dried by gas burners, is at once a source of danger, and ought to be controlled by enactment.

The dictum of Capt. Shaw that he would sooner have to deal with buildings of brick or concrete and solid timber than so-called “fireproof” structures has been amply confirmed in this recent case. The stone walls have been found calcined and fractured, and the iron girders and joists of floors were twisted into all shapes, and buckled the walls, so that they became a dangerous element to the fire brigade. We have still to learn

many facts as they reveal themselves to those whose duty it is to investigate the matter; but we are left in no uncertainty as to the danger inherent in unprotected iron structures like floors and roofs, and their rigid connection with walls of masonry. Openings in party-walls, lifts, and staircases have contributed, no doubt, to the disastrous spread of the fire. Equally important it is to inquire into the means of escape that are provided for workpeople engaged in these buildings, whose condition forms so sad a feature in the catastrophe, and for those brave firemen who are left to do their perilous duty amidst belching flames and smoke, and, not least, the hot steam to which they are exposed from the water thrown on the heated walls.

LAY CRITICISM OF DESIGNS.

THERE are occasions when lay opinions expressed on professional matters are presumptuous and disturbing. Few persons would venture to set up their own judgment on a question of treatment of a disease or on any legal matter; but on any architectural subject it is not unusual to find people openly questioning the expert opinion of professional men, curiously exemplifying the adage, "Fools rush in where angels fear to tread." Strange to say, those who are most prone to set at nought the opinions of professional men are they who have taken the trouble to invite professional skill. One would have thought, at least, that these wise-acres would have acted independently; that, having such a good opinion of their own abilities, they would have instructed their surveyors to make plans in accordance with their own views and have dispensed with any other professional aid. They could have formulated a scheme and instructed their official to carry it out. But, no; they want a little popularity, and advertise for designs, and then take upon themselves to select one that will suit their purpose. There can be no objection to this arrangement if the competing architects are willing to abide by the decision, and if the usual hocus-pocus proceedings are not practised; but the board is a little afraid of their own knowledge, and so, with commendable courage, they agree to take the opinion of an expert referee. Sometimes, no doubt, they are reluctantly forced into this position by the competitors, or some central architectural body, or by the force of precedent; for, having employed an assessor to make a choice for them, they curiously revoke his decision and assert their own authority. This sort of contradictoriness or inconsistency has been illustrated much of late. It is difficult to find a motive, except it be that the majority of building promoters who invite architects to compete wish to be their own masters, and to obtain all the honour and glory of the selection of design. It is something to be proud of for Mr. Smith or Mr. Jones, or other local "big-wig," to be able to say he was one of the arbitrators who sat on the design—that he really selected it, or that he was one of the champions on the board who stuck up for and helped to promote the adoption of the best design, even against the expert skill of an assessor. That he actually succeeded in overthrowing the decision of the professional assessor and divided the board on the issue, is at least something to boast of, especially if the design so championed turned out to be a success. One of the latest instances of local ambition is that afforded by the Surbiton District Council, who advertised for designs for new municipal offices, appointed a professional assessor to advise them, and then set aside his opinion as to order of merit for their own in coming to a final decision. As to which of the three selected by the assessor ought to be placed first admitted certainly of

some doubt in this instance, and we believe the council were justified in preferring the plan which the assessor himself had placed second. Our own remarks on the designs, which we made last week, confirm the council's selection of design in some points at least. The plan is certainly its strongest point. The assessor himself, in his report, speaks of the plan as a "very good one"; but as regards the artistic treatment, he prefers the design he selected as the best; but says directly after No. 25 is "also a good design in these respects." No doubt the assessor's report was rather indeterminate and somewhat vague, and left the committee in rather a state of hesitancy as to which of the three ought to be selected. Events have shown how desirable it is for an assessor to be, we will not say dogmatic, but sufficiently decisive as not to give a committee any opportunity for preferring their own opinion. Here Mr. Mountford had admitted the merits of the three designs were "sufficiently equal to make it somewhat difficult to decide between them"; and he goes on to say that the "plan placed third in the report may have the most advantages." These advantages were so forcibly impressed upon us, that we should have had little hesitation in placing it first. Now, the lay mind—if we can so describe that of the council—on questions architectural, as on other topics, is generally inscrutable or oblivious to nice distinctions. They can only understand decided points, about which there can be no dispute; but for such details as well arranged and grouped offices, good entrances and corridors, sufficient light and ventilation, artistic points of design, and other matters which only the professional man can appreciate, the ordinary lay committee is helplessly impotent. So that when an assessor says two or three designs are almost equal in merit, we may be quite sure that Mr. Tomkins or Mr. Jones will be quite unable to discern any distinction, and believe that the assessor himself has no distinct preference. In this way we can explain the action of certain members of the Surbiton Council. They thought they were fully justified in setting aside the design selected as best by the assessor, and putting in its place another. As it happens, the choice they have made is a good one, though it might have been much worse; but what we wish more particularly to refer to is the air of superiority assumed by certain members in the discussion on the subject. One of them, in opposing the amendment to the effect that they should submit their judgment to the assessor, exclaimed: "He surrendered his judgment to no one," for, having examined the plans carefully, he came to the conclusion that the plan selected by the assessor was not suitable for the magnificent site. On the question of elevation the same member is reported to have said the design did not fall in with any of the schools, and it was not suitable to the taste of the people of Surbiton. Another member said "he did not think they ought to take too much notice of specialists and experts, but they ought to use their common sense," and he complained the assessor had allowed them a "lot of rope." In this instance, the committee, in selecting one of the three recommended by their assessor, were perfectly within their right, as a clause of the conditions clearly stated that the council had appointed an assessor to advise them, and another clause (5) stated that "If by any sufficient reason the design placed first be not carried out, then the design placed next in order by the assessor shall have priority of consideration, &c."

But it is the boasted "common sense" of the lay-member of committees that is so extraordinary and offensive to the minds of those who wish to see justice and consistency. Although in this case not much harm has been done, except, perhaps, in rejecting two better external treatments, it is right for the

competing members of the profession to demand a more satisfactory solution. If the committee are dissatisfied with the assessor's decision, they ought in fairness to appeal to the body of competitors or to another independent arbitrator. These examples of interference with professional awards are often as ludicrous as they are blatant. How is it possible for a committeeman, who only has a faint idea of the requirements of a plan, to place his opinion before that of an assessor who has gone thoroughly into the problem, and has had to keep in view both plan and external design and construction? Yet, so it is, that an architect's professional work is judged by laymen who cannot interpret technical drawings. Lay opinion and criticism on questions of architectural design are exceedingly vexatious and provoking, even in ordinary building matters. It is always the bugbear of "common sense" that is trotted out—a very valuable quality when controlled by knowledge and skill, but generally exceedingly perverse and dangerous when these essentials are absent. The man who is boastful of his common sense often runs his head against the veriest fact. He looks perhaps for a square plan because he can understand it better. He makes a fuss about a closet or a lavatory in a plan, but overlooks the merit of the entire arrangement; or he thinks he has found a "mare's nest," when, all the time, a little study of the drawing and sections reveals the apparent discrepancy. These critics are often men of one idea;—they are cranks about sanitation, about some special department, and all else must go to satisfy their whims. When will the architect's province be exempted from this interference? We never hear of the lawyer's, the physician's, the surgeon's, the musician's, or the painter's work being subjected to criticism—only the architect's. Is it because it appeals to the eye and our sense of utility, whereas in each of the other cases special or technical knowledge are in evidence, and have to be mastered? But this is not the only explanation, and we must wait till the architect and the public better understand each other.

WROUGHT-IRON AND STEEL IN CONSTRUCTIONAL WORK.—XXXI.

JOINTS between complete girders are shown in the accompanying figures:—

Fig. 199 shows how rafters of joist section can be united. Very little bending to acute angles can be done without rolled sections. To set almost any section to an acute angle some welding is necessary, and this is, as a rule, objectionable. Hence the method of jointing shown is generally preferable. Two fish or joint plates, A A, are riveted or bolted one on each side of the abutting joists; they are bolted in the illustration for convenience of erection in place. The circular bearing-plates of cast-iron shown riveted outside the covering plates are to take the pin for tension and suspension rods.

Fig. 200 illustrates a jointing of two girders at an angle, through the medium of a plate. The girders are of lattice form, with distance-pieces between the flange angles, and the end angles are either riveted or bolted, as most convenient.

Fig. 201 is an example of the jointing of four girders on top of a cast-iron column for a roof. A is the top of the column upon which the horizontal girders B C abut at an angle, the roof being polygonal in plan; D is the springing of an arched roof rib or principal inserted between the ends of B and C, and having angles riveted next the edges; E is a horizontal beam bolted to the inner angles on D, the beams E being for the purpose of carrying a raised promenade. The setting of the ends of the flange-plates of a number of girders to an angle, as in the figure, is done by templates, the uses and advantages of which were noted in Article XXX. The bending of the angle-irons to acute and obtuse forms is usually done over blocks cast to the angle required, the bending being effected with a sledge, or by means of stamps or dies under the steam hammer or press. The angles have to be heated

for the purpose, and they are cut to length first. When a very large quantity are wanted, acute and obtuse angles are supplied by the rolling-mills to requirements.

Fig. 202 shows the union at the springing of a

stretcher type, comprising a plate surrounded with flange angles riveted to one or to both faces, and bent or set round to the shapes required to

Fig. 203.

fit against the longitudinal girders; for light distance pieces the plate can sometimes be dispensed with, and a deep webbed tee-iron be bent round. Some welding has to be done on such work as this, because neither angle nor tee can be bent to acute shapes, but each corner has to be cut to make the acute angles, and welding must necessarily

flange of A, is riveted to it with a butt joint, and the inner stiffener of A is turned round to form a bracket upon B, which is therefore confined rigidly in each direction. The method of supporting the troughing is indicated here, but special notice will be given to that later.

Fig. 204 shows a union of a main-centre

Fig. 205.

follow. It is much easier to fit girders by cutting the corners off at an angle to clear the angles in the longitudinal girders than to attempt to fit them around; the latter has to be done in certain cases, but never unless absolutely necessary, because of the troublesome fitting involved. These remarks apply mainly to cases in which

cross-girder A of a swing-bridge with a centre vertical strut B. The girder A is of box form, as is also the strut B; A is set down to receive B, and the plated gusset-bracket C serves to stiffen the union of the two, which is still further assisted by the gusset-plate D. The vertical and horizontal members are thus rendered sufficiently

Fig. 206.

the girders are equal, or not very dissimilar in depth; but when the longitudinals are much deeper than the transverse ones a plain butt joint is generally made, or the latter are made to rest upon the former, or, in some cases, suspended therefrom.

Fig. 203 shows a usual method of the jointing of main single-web girders A to the cross-girders B of a railway-bridge; B rests upon the bottom

rigid without any top bracing; the gusset-bracket C is simply a development of the stiffener A in Fig. 203. It is frequently necessary to set down girders in other ways than that shown, in order to make joints where head-room is limited.

Fig. 205 illustrates a case of this kind, in which the distributing girder A is set down to take the cross-girder B.

Fig. 206 is an illustration of the union of cross-

girders A to longitudinal girders B of Warren type; the former rest upon the bottom booms of the latter, to which they are riveted through angles. A A are single-webbed girders placed in pairs. Upon them the rail-bearers CC, each built of three channels, with timber sleepers, are riveted through knees of tee section.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—X.

By AN ASSOC. INST. ELECT. ENGS.

CONDUCTORS IN PRACTICE.

INSULATION RULES OF THE INSTITUTION OF ELECTRICAL ENGINEERS.

TO complete the information respecting the insulation of conductors, we insert here the following extract from the 1897 edition of the "Rules Recommended for Wiring for the Supply of Electrical Energy by the Institution of Electrical Engineers":—

"Insulated conductors may be broadly classed under two heads:—

"(A) Those insulated with a material as a dielectric which is itself so impervious to moisture that it only needs further protection from mechanical injury, or from vermin.

"(B) Those insulated with a material as a dielectric which, in order to preserve its insulation qualities, must be kept perfectly dry, and therefore needs to be incased in a waterproof tube or envelope, generally of soft metal, such as lead, which is drawn closely over the dielectric.

"When class A is used, the dielectric must be perfectly damp-proof, and not in any case less in thickness, measured radially, than 30 mils plus 1-10th of the diameter of the conductor; it should not soften at a lower temperature than 170° Fahr.; the minimum insulation of a test-piece cut from it should be that given in column 7 of the table (to be given later), the test being made at 60° Fahr., after one minute's electrification, and after the test-piece has been immersed in water for 24 hours.

"When class B is used, the same conditions as to minimum thickness and softening temperature of the dielectric should be enforced as in class A; its covering should be such that a test-piece cut from the conductor, and immersed in water will not break down when an alternating pressure of 2,500 volts, having a frequency of from 40 to 100 periods per second, is applied for ten minutes between the conductor and the water, the test-piece, previous to immersion, having been bent six times (three times in one direction and three times in the opposite direction) round a smooth cylindrical surface not more than twelve times the diameter of the conductor measured outside the dielectric. The coil from which the test-piece was cut should be tested in a similar manner to class A; but the minimum insulation resistance should be that given in the table, column 8.

"Conductors of class A must be protected from mechanical injury by being covered with stout braid or taping, prepared so as to resist moisture, and must be further protected by casing, or by being drawn into pipes or conduits.

"In the case of conductors insulated as in class B, great care must be taken to protect exposed ends of conductors where they enter the terminals of switches, fuses, and other appliances, from the possible access of moisture which might creep along the insulating material within the waterproof covering.

"Concentric conductors should in all respects conform to the requirements herein laid down for single conductors; the insulation resistance of the outer dielectric should be that given in the table for single conductors, having the same diameter as the outer conductors. The insulation resistance of the dielectric separating the two conductors should be twice that of the outer dielectric.

"The bending test of concentric conductors, class B, should be made round a cylinder twelve times the diameter of the outer dielectric.

"Flexible cord conductors—i.e., those made up of a number of wires not larger than No. 29 S.W.G., which are then insulated (in many cases two such conductors are twisted together, so as to form a double conductor), should only be used for attachment to portable appliances, or for the wiring of fittings. The insulating material used as the dielectric should be either pure rubber or vulcanised rubber of the best quality. If pure rubber be used, it should be laid on in two laps, care being taken that these should be lap-joint.

The radial thickness of the dielectric should never be less than 16 mils for pressures up to 125, or 20 mils for pressures up to 250 volts. Each coil should bear a certificate that a piece one yard in length cut from it has withstood for five minutes an alternating pressure of 1,000 volts, having a frequency of from 40 to 100 periods per second applied between the two conductors twisted together, the piece being subjected during the test to the vapour arising from a pan of boiling water placed at a distance not exceeding 3ft., and immediately below it."

There are various considerations which have to be taken into account when deciding upon the conducting part of the line so as to give continuity. The following, among others, are important:—

1. The material to use.
2. The best area of the conductor for the current required.
3. The capital outlay.
4. The cost of power generated and maintenance.
5. The permissible line loss and fall of pressure.
6. The method of protecting the conductors and risks.

Generally speaking, there are three methods of distributing electrical energy; thus, circumstances may require—

1. Varying currents at constant pressure; or
2. Constant currents at varying pressures; or
3. Varying currents at varying pressures.

And it is obvious that although much may be done by laying down general rules, much more depends upon local circumstances, and each case must be considered as a separate and distinct problem. In all cases the one desideratum is minimum all round cost, and at the outset it will be observed from general considerations that one condition produces contradictory results when some other condition is considered. Thus, (1) to economise capital outlay, the weight of the metal forming the conductors should be as small as possible—that means, the conductor should have a small cross-sectional area; whilst (2) to economise energy, the conductors should introduce little resistance, which means that the cross-sectional area should be large. Then, again, the heating effects of electricity must be considered. As is well-known, the temperature of a conductor is always raised when traversed by electricity, and the essential condition to be fulfilled so that the temperature is between safe limits, is that the heat should be lost (by conduction and radiation) as fast as it is generated. Increase of temperature in conductors means—

1. Increase of resistance, and this leads to diminution of current, loss of pressure, and waste of energy.

(2) Injury to Insulation by softening the insulation material, the result of which is a tendency for the conductor to decentre and make contact with other conductors, and to set up short circuits with iron conduits, &c.

(3) The Possibility of Fire Risks.—We may conclude, then, that if the conductors are too small, a large proportion of energy may be wasted, and that any saving in the capital outlay of the conductor which would result will be expended in fuel and machinery; therefore, the determination of the best area of the conductors is one that requires much thought and attention. The metal used universally for lighting purposes is copper, on account of its high conducting qualities; but for the purpose of showing how to decide which is the best metal to use for transmitting electrical energy in any case that may arise, an example given by Mr. A. T. Snell is here introduced. The comparison should be made between copper and iron, and it is necessary to take into consideration the specific resistances, specific gravities, breaking strains (which are important when dealing with aerial lines), and the cost of each. And for convenience of reference, a table (similar to the short one given below) should be constructed giving particulars of the data required:—

Metal.	Sp. Resistance in Microhms at 0° C.	Specific Gravity.	Breaking Strain in Pounds per Square Inch.	Price per Pound in Pence.
Copper (hard-drawn)	1.021	8.8	56,000	5.5
Iron	9.637	7.7	85,000	1

Since iron has six times the resistance of

copper, iron wire having the same resistance for a given length would have six times the area of cross-section of the copper wire; then, if W_c and W_i denote respectively the weights of the two wires, copper and iron, of the same length and resistance—

$$W_i : W_c :: 7.7 \times 7 : 8.8 \times 1$$

Since the specific gravities are as 7.7 to 8.8,

$$\therefore W_i = \frac{53.9}{8.8} W_c = 6.1 W_c$$

Similarly, if P_c and P_i be the price of the copper and iron wires respectively—

$$P_c : P_i :: 1 \times 8.5 : 6.1 \times 1.$$

$$\therefore P_c = \frac{8.5}{6.1} P_i = 1.4 P_i,$$

that is, copper costs 40 per cent. more than iron when the lengths and resistances are the same. For aerial lines, the weights and breaking strains must also be considered, and if L_i and L_c denote lengths of span for the iron and copper respectively, we have—

$$L_i : L_c :: 85,000 : 56,000.$$

$$\therefore L_i = \frac{85}{56} L_c = 1.5 L_c,$$

but the iron wire will require stronger supports since $W_i = 6.1 W_c$. We may remark here that the question of insulation must be taken into account, and it is obvious that the cost of the insulation for the iron wire would be greater for a given thickness than that of the copper of same length and resistance. For the purpose of comparing different materials, Snell forms what is called a *figure of merit* for each material. This is of the nature of a constant, and is formed by taking the product of the reciprocals of the specific resistances, specific gravities, and price per pound multiplied by the breaking strain, the best material giving the largest figure. Thus—

$$\text{Figure of merit} = \frac{1}{\text{Sp. R.}} \times \frac{1}{\text{Sp. Gr.}} \times \frac{1}{\text{Price}} \times \text{Breaking strain.}$$

Since copper is so much used, the following particulars respecting the essential properties will be useful:—

The specific gravity of pure annealed copper is approximately 8.9 at 69° F.

The density of copper is 555lb. per cubic foot, or 0.32lb. per cubic inch.

The weight per mile of round copper wire, d mils in diameter, is approximately $\frac{d^2}{62.5}$ lb., or $d^2 \times .016$ lb. (Note.—1 mil = .001 of an inch).

Therefore, to find the diameter of a copper wire weighing w pounds to the mile, proceed as follows:—

$$w = d^2 \times .016 \text{ and } d = \sqrt{\frac{w}{.016}} = \sqrt{62.5 w} = 7.91 \sqrt{w}$$

The resistance per mile of pure copper wire, d mils in diameter, is $\frac{54892}{d^2}$ ohms at 60° Fahr.

From this we get the resistance per 100 yards for different sizes of wire. For purposes of calculating the resistance of copper wires, it will be useful to remember that 10ft. of pure copper wire 0.01in. in diameter has approximately 1 ohm resistance.

The specific conductivity of pure copper is usually represented by the number 100, and the manufacture of commercial copper for cables has reached such a state of perfection that the specific conductivity of the copper used for electric light leads is seldom less than 98 to the same scale.

The specific resistance of pure copper at 0° C. is 0.000001642 ohm, or 1.642 microhms, per centimetre cube, or 0.00000064 ohm or 0.64 microhm per inch cube.

The specific resistance of copper of 98 per cent. conductivity is 1.729 microhms per centimetre cube, or 0.68 microhm per inch cube at 60° Fahr., therefore the specific resistance of any other sample of "p" per cent. conductivity of copper

= $\frac{98}{p} \times 1.729$ microhms. With one exception the resistance of conductors increases with increase of temperature. According to the results of the experiments of Dr. Matthiessen, the resistance of metals increases with the temperature according to the empirical formula—

$$R_t = R_0 (1 + at + \beta t^2)$$

in which—

$$R_t = \text{resistance at a temperature of } t^\circ \text{ C.}$$

$$R_0 = \text{ " " " " } 0^\circ \text{ C.}$$

α and β are numerical constants depending on the metals.

For all but the most accurate calculations the approximation—

$$R_t = R_0 (1 + \alpha t).$$

is sufficient. For copper, $\alpha = .00387$ and $\beta = .0000597$. In other words, the resistance of copper increases with increase of temperature at the rate of 0.387 per cent. for each degree Centigrade, and 0.216 per cent. for each degree Fahrenheit. These numbers, 0.00387 and 0.00216, are known as the temperature coefficients, which may be defined as that constant by which the resistance of a wire at t° must be multiplied to get the increase on the resistance at $(t + 1)^\circ$. Thus the resistance of a copper wire at T° Fahr. is—

$$R_T = R_t (1.00216)^{T-t}$$

Temperature Limits Rule of the Institution of Electrical Engineers.—In the 1897 (July) edition of these rules we find "that the conductors should be of such size that when the maximum current is passing continuously through them their temperature shall not exceed 130° Fahr. It will, however, generally be found that if the conductors are worked up to a density of current corresponding to this increase of temperature, the resulting fall of potential or drop in volts will be inconvenient and uneconomical. It is imperative that the temperature of 130° Fahr. should never be exceeded, and, therefore, it is necessary to take into account the maximum temperature to which they may be subjected, independently of electric heating, in each particular locality, and the greatest increment above this temperature should not be more than will raise them to a temperature of 130° Fahr."

"If the maximum temperature of the British Islands be taken as 100° Fahr., then the increment due to electric heating must not exceed 30° Fahr.; that is to say, the size of the wires should be such that, when carrying the maximum current continuously for many hours, the temperature does not rise more than 30° Fahr. above the temperature for the time being of the place in which they are situated. In specially hot places the wires should be so large that the electric heating should be almost nil, and the wires should be specially insulated with insulating material which does not deteriorate at the highest temperature to which it will be subjected."

Now, experiments show that the rise of temperature of an insulated wire is less than that of a bare wire, same size, carrying the same current under the same conditions, because there is a larger exposed surface for radiation. From a large number of experiments made by Kennelly in 1889, he has been able to deduce the relation between the current and the diameter of the core, consistent with safe rise of temperature for interior wiring, where insulated conductors are inclosed in casing for protection, with the result that the effects of radiation and convection are diminished to a minimum. The equation deduced by Kennelly may be given in various forms as follows:—

$$c = 560 \sqrt{d^3} \quad \text{where } d = \text{dia. of core in inches}$$

$$= 0.01775 \sqrt{d^3} \quad \text{" " " " mils.}$$

$$= 138 \sqrt{d^3} \quad \text{" " " " centimetres}$$

$$= 4.375 \sqrt{d^3} \quad \text{" " " " millimetres}$$

where c = current in amperes.

$$\therefore d (\text{inches}) = 0.0147 \sqrt[3]{C^2} \text{ or } \frac{\sqrt[3]{C^2}}{70} \text{ (approx.)}$$

$$d (\text{mils.}) = 14.7 \sqrt[3]{C^2}$$

$$d (\text{cms.}) = 0.0373 \sqrt[3]{C^2}$$

$$d (\text{mms.}) = 0.394 \sqrt[3]{C^2}$$

As will be obvious, the temperature effects must have an important effect upon the carrying capacity of wires, and presently we shall include a useful working table giving the maximum currents for different conductors under various circumstances, &c., so as to compare the conditions imposed by the Fire Insurance Offices, Institution of Electrical Engineers, and by Kennelly's formula. As is well known, many fire offices state that the cross-sectional area of the conductors used shall be such that the current density in any conductor shall not be more than 1,000 amperes per square inch of cross-sectional area. On the other hand, the Institution of Electrical Engineers give formulæ for calculating the current for any conductor. Thus the maximum current for situations where the external tem-

perature is above 100° Fahr. is given by the formula—

$$\text{Log. } C = 0.775 \text{ log. } A + 0.301,$$

$$\text{or } C = 2 A^{0.775}$$

where C = current in amperes, A = area in 1,000ths of a square inch. The maximum rise in temperature will be about 10° Fahr. on large sizes.

The maximum current allowable in any situation is given by the formula—

$$\text{Log. } C = 0.82 \text{ log. } A + 0.415,$$

$$\text{or } C = 2.6 A^{0.82}$$

The maximum rise in temperature will be about 20° Fahr. on large sizes.

(To be continued.)

THE SOCIETY OF ARCHITECTS.

THE second ordinary meeting of the Society of Architects was held on Thursday evening in last week, Mr. Walter Emden, J.P., L.C.C., the newly-elected President, in the chair. Mr. James Howard Hendry, of the Bourne, Farnham, Surrey, was elected as a member, and a number of donations to the library were announced.

THE ANNUAL REPORT OF COUNCIL

and the balance sheet were adopted on the motion of Mr. ELLIS MARSLAND, hon. secretary, seconded by Mr. R. W. COVENTRY DICK. In their report the council referred with satisfaction to the continued prosperity of the Society. During the past year there had been thirty-three candidates for election as members and associates, of whom twenty-eight were approved by the council and duly elected, and one past member was reinstated. Seven had died since the last report, and eight had retired, with the result that there was now a total of 559 on the roll—an increase of 14 since Oct. 31, 1896. With respect to the comparative fewness of elected candidates, members were reminded that on and after Nov. 1, 1896, membership was not open to candidates under 35 years of age without examination. The question of examination had been under the constant and anxious consideration of the council, and they hoped shortly to publish the definite results, also of negotiations which were being carried on with other bodies. The following meetings have been held (all of which were reported in our pages):—President's address, Mr. R. Walker; "Arguments for and Against Registration," discussion postponed; "Restoration," Mr. Thackeray Turner; "Arguments for and Against Registration," discussion; "Technical Schools from a Schoolmaster's Point of View," Dr. C. H. Draper; "The Advantages to Country Architects of Belonging to a London Society," discussion; "The Forum of Rome," Mr. A. Fisher; anniversary meeting. The council expressed regret that members contented themselves with reading reports of the Society's proceedings, without making more efforts to attend the sessional meetings, and they were reminded that membership of a Society carried with it duties as well as privileges. Every new member in particular should, it was suggested, upon his admission, seek to become acquainted with other members and the officers of the Society, thus enlarging a fellowship which might benefit the whole Society. It was much to be desired that some progress would soon be made with the Bill for the Registration of Architects, which had long been before Parliament. The council hoped that arrangements might be made to continue the meetings held in the provinces for the furtherance of this object during the ensuing session. It was of the utmost importance that members should keep themselves fully alive to the urgency of this matter, and more especially endeavour to influence members of Parliament and fellow-members in promoting the second reading of the Bill. At the various meetings of the council and committees many important subjects had been considered affecting the interests of architects, and advice had been given in cases submitted to the council, which had proved of material assistance. Members were strongly recommended to avail themselves of this resource in cases where consultation might be useful. In conclusion, members were reminded that the reading-room at St. James's Hall was now open daily.

The PRESIDENT then proceeded to deliver his

INAUGURAL ADDRESS.

Having expressed his thanks for unanimous election to the chair, Mr. Emden continued: It

may seem ungracious, but it certainly is not meant so, if I say that I do not believe in societies as at present constituted, and that for most of the years of my professional existence I stood aloof from them, and only joined this Society because of its efforts to obtain a Registration Act for Architects, and with a desire to help in this programme. I say this because I find, and have always found, that while they purport to give the public an assurance as to the capabilities of an architect, practically without compulsory registration they cannot do so. There is no compulsory regular examination, and no diploma issuable under the law as in the case of other learned professions; indeed, while anyone can set himself up as an architect, without any examination, and without previous study, experience, or competent knowledge, and as long as examination is voluntary, the best benefits of these societies are but small security to the public. Examination is, no doubt, more or less insisted on before entering the Royal Institute and other societies; but this does not meet the case, as, while the use of letters indicating the connection of persons using them with any society may mean that some examination more or less has been accomplished, many, indeed, by far the greater number, do not belong to any society and yet practise. Many of the most competent men practise without belonging to any society, so that it is seldom the public inquire, or care, if the professional man employed belongs to a society or not. Let me again point out, and insist upon the fact, that anyone, never mind what his position is, can call himself (even be he a labourer, or, as in a known case, an undertaker) an architect, surveyor, or engineer, without let or hindrance; and voluntary examination can afford no real protection to the public that the architect employed will design sanitary and properly-constructed buildings. Except absolute compulsion is enforced under an Act for Registration, nothing will accomplish the exclusion of the incompetent.

THE PROFESSION.

The duties of the architect, or master builder, no doubt originally covered the engineering efforts as well as the architectural efforts of the ancient world. Unfortunately, at the present day in England, and probably to a great extent because there is no State intervention in the shape of compulsory examinations (as in other countries), there has grown up in the work of the architect, less knowledge of construction in its larger form, and a separating of engineering from the architectural work, and hence, want of artistic design in our great engineering works. Much has been done of late years by various Acts of Parliament relating to buildings, and for the preservation of public health. A serious difficulty, however, is that each step requires an Act of Parliament framed more or less by men with incomplete knowledge or experience of the necessities, while the alterations necessary in the present Acts so indirectly affect the public that it takes years before even the most simple or urgent necessity for alterations or modifications in the law becomes apparent and obtains a remedy. Much might be done if the Local Government Board could be made more regularly and consistently the recipient of information gained by local and other authorities of the various necessities in building and its sanitation. The Board should be authorised to set machinery to work to obtain from the various surveyors in the districts regular reports, and could therefrom draw information for the alterations necessary in our Public Health and Building Acts, invoking the action of Parliament in the same way as in a question of insanitary areas by a provisional order. Much would thereby be gained, and dangerous delays saved. Undoubtedly, and more particularly as far as London is concerned, the new Building Act is a step in the right direction, and one cannot but admire the courage and perseverance of Dr. Longstaff, L.C.C., who was chairman of the Building Act Committee. The more so that he, a layman so far as building was concerned, set himself to work to become master of the enormous mass of details, and all the *pros* and *cons*, and necessities for alteration, and should have succeeded in carrying through so voluminous an Act as this necessarily was to what must certainly be called a successful issue. No doubt it will prove of great advantage to London, and while its errors must be remedied as they appear, its benefits must not be forgotten, as the Act is a substantial step in advance. One of the difficulties which has to be contended with by the

professional man is the overlapping of the powers of the various authorities. It is a crying evil in London where the central authority deals with frontage lines, projections, construction, and all such-like matters, and puts in action its own surveyors, that there is in each district the surveyor of the local body also dealing, more or less, with the same subjects and other overlapping duties. If the central authority laid down the rules and regulations under such Acts as deal with these questions (after consultation with the local authorities) and the local authorities administered them, much expense to building owners would be saved, and the public also, by preventing the duplication of officials and duties and further friction, as useless as it is delaying, avoided, thus facilitating building operations to an enormous extent. To pass a set of plans under the present system is not only a complicated, long, and harassing process, costly to the building owner, but without increasing the protection of the public; indeed, it is wasteful and unproductive of any benefit at all. A very substantial fee might well be obtained from the building owner, under the simpler system for the passing of, and licensing plans, leaving the owner better off than now, and making the public purse the richer. As a step in the right direction, it ought to be possible (and I think it is possible, were an effort to be made) to so arrange the surveyorship for the authorities that one surveyor in each district should suffice, and that the central body should delegate the active administration to them, and so avoid overlapping, and facilitating very considerably building operations. Another complication in town building is consequent upon our system of leases and the necessary intervention of the surveyors to freeholder and intermediate owner; and here, as private rights are touched, it is difficult to frame laws to deal fairly with it, to save the uncertainty, expense, and delay, and yet fully protect owners' just rights. Indeed, it is so difficult and delicate a subject to handle, that it will be a bold man who accomplishes it. I make it as a suggestion, but as that only, that the building owners should be at liberty after notice given to the freeholder or superior landlord to make the alterations he may deem necessary, subject to a right to the freeholder or superior landlord to formally object, and the objection (failing agreement) being heard and determined by a permanent official under the Local Government Board.

SANITATION.

I should like to turn for a moment to sanitation, and ask you to consider how much might have been accomplished by the present time, how many lives saved, and what spread of disease prevented, had the professional man to pass thorough examination, and obtain an intimate knowledge of the necessity of sanitation first, before practising? What I say does not apply to individuals, many of whom have done great and important work in this direction. But can it be said the profession, as a body, has a thorough knowledge of this subject? By the neglect of each Government to provide for compulsory examination, and the registration of competent men, they have now much to answer for in this direction. In England, with our Free Trade principles, we have hundreds of systems and apparatus stated to be, and no doubt credited with being, good and capable of accomplishing sanitary perfection; but, except by the test of experience, what examination into these claims is brought to bear?—and specialists, each with their own specific, are called in instead of the architect, and no system is thoroughly or effectually exploited. Experience may often be dearly bought by those who have to submit to the use of some so-called sanitary apparatus or arrangement of house or other drainage until its defects are discovered. It is no one's business to say which is best, and even our local authorities pin their faith to different systems, no doubt recommended by their officials. How, then, can professional men be expected to deal more thoroughly than the authorities do? Surely this is folly, when so much depends upon what is used. Can it be wise for such a state of confusion with regard to this most important factor—sanitation—to be allowed to go on unimpeded and almost unthought of until some great calamity visits us? The fact is, no public body and no authority likes to take the responsibility of recommending anything new; but the Local Government Board should be obligated by law to take up and examine into the necessities and lay down what should be done. In latter years no doubt advance has been made,

but, until some such power as I before suggested is delegated to the Local Government Board, and those whose duty it is to design and superintend buildings are compelled to pass a thorough examination, no thorough knowledge can be assured, even though there depends upon it the life or the health of every individual citizen.

ART.

With regard to the question of art, undoubtedly much progress has been made during the Victorian era. When we look at the houses built not long before the accession of the Queen to the throne (such houses as form the various squares of London) we obtain at once a very fair exemplification of what was considered a good class of dwelling-house at that period. Compare these with a good dwelling-house of the present period. Sanitarily and constructively we have improved, but certainly in comfort, luxury, and artistic design the advance made is strikingly great. Take again the shop of 60 years ago, and compare it with the artistic design of much of the work of the present day, and the advance will again be strikingly seen. If we turn from this to a higher branch of work, to our more public buildings in the shape of churches, hospitals, theatres, music-halls, hotels, restaurants, &c., at once the luxury and artistic improvement are so marked that one can hardly believe the whole of it has been accomplished in the space of one reign. Moreover, when it is considered that the improvement has come about not because the State has lent its aid, but has been accomplished under many difficulties, it becomes a useful study to consider not only how much greater it would have been, but how much waste in its accomplishment might have been saved had Compulsory Examination and Registration protected the investor and public. This advance, however, speaks much and well for the energy and artistic efforts of the architect, and, considering the difficulties he labours under, should not be forgotten. Too much credit cannot be given to those who have fostered and increased the strength of artistic effort in this country, overshadowed as it is by the question of everything having to be done by private enterprise, and that even in the most elaborate decoration of the buildings for public use, the owner's first consideration must be that it shall pay. I would, before leaving this subject, like particularly to draw attention to the great spread, among the people at large, there has been in Her Majesty's reign in artistic teaching. Many institutions and schools have grown up, by the efforts of the City and London County Council and other corporations and public bodies in the establishment of technical schools, and much has been done to educate those who have taste and intelligence and are willing to devote their spare time to the study of artistic work. It has always seemed to me a pity and a neglected opportunity on the part of trades' unions that they do not make an effort to improve their workers, set up an examination in their trades for each union, and thus be able to assure employers as to the competence of the men employed, and enable, by its certificate, the workers to show which are its best men. It would certainly serve a useful purpose; more useful than some of the other work the unions do, and it would place them in a better and higher position in public opinion. I have often heard it stated that if the profession of architect were to become a registered profession dealt with by compulsory examination, that the artists in the profession would be hampered and prevented from taking up the profession; but when it is seen that not only many of those who are actual workers with their hands by day can, in their evenings, turn out such good work, this reason against the compulsory registration of architects falls to the ground, as it would also if tested by the result of the efforts which, in the old days, were made by the great architects and artists, who often enough struggled through years of hard work in manual and other trades to make themselves, as they eventually succeeded in doing, artists. Indeed, the original architect was the master builder. It cannot be for a moment supposed that artistic effect can be deterred or kept back or even inconvenienced by a knowledge of construction and sanitation. It would be as reasonable to say that a sculptor or artist should not know the anatomy of the body, since his examination in it would be detrimental to his skill. I cannot think, either, that any society gives credit to such a reason, or they would not have established examinations for those who wish to

enter their ranks. Construction was the duty of the first designer of a building when there was no distinction of engineer and architect. As civilisation grew, the ornamentation, or the artistic portion of the architect's work, grew also; but it grew out of construction, and should be the refining and finishing of it, and consequent to it. The best specimens we have of architecture are those which by the form and construction give necessity for the ornamentation.

DRAWBACKS TO THE PROFESSION.

It would be difficult to say that the architectural profession was not a good one for young men to enter; but it can safely be said that it would be a better profession for them to enter if its status were more assured, as it would be if they had to pass a compulsory examination, proving their knowledge and title to professional position before assuming it. It would by no means discourage those who are worth encouragement, while it would keep out the element of uncertainty and be an assurance to the public of the capability of the architect to design a building, and his capability also of seeing that the construction and sanitation were well carried out. We are often told that vested interests must be considered, and that such vested interests in the profession would mean admitting large numbers of incompetent men; but the delay in obtaining compulsory registration and examination only allows the evil to grow, and its establishment would stay it altogether, while death would, within but a few years, deal with the evil as it existed at the passing of the Act. But I personally do not agree that this vested interest is such a large factor, at least where it absolutely covers incompetent men. When Parliament intervened to protect the public from quacks, both as doctors and surgeons, and later as dentists, there was this same vested interest and incompetency—yet where is it to-day? And all this has been accomplished during her Majesty's reign. No; the real difficulty is poor humanity—poor selfish humanity—those who fancy their position is now assured and forget others, and would keep them outside the pale. There are those who, having some letters to add to their names, forget the public and the greater interests at stake for their own personal interests, and prevent, or at least do nothing to help, the cause this Society has at heart. There is a strong feeling of jealousy in some quarters, and of a dog-in-the-manger principle (forgetful of all public duty) which causes opposition to what all are bound to acknowledge would be good and beneficial if accomplished. This feeling raises difficulties of detail and petty points and enlarges upon them, and while many of them are so trivial as to have no real existence, they are used all the same to conceal the real desire not to help the cause of registration. I trust this course will not succeed in preventing the remedy being eventually obtained. It must, however, still remain for this Society to devote its energies to obtaining the support of Members of Parliament pledged to bring about registration, and to proving the great necessity of it to those who take the lead in work for the public good; for, indeed, whatever assured position it may give the professional man, it is before all necessary for the public benefit. I trust my words and earnest desire may accomplish something in the direction to which for many years I have lent my services, and I trust my poor efforts may succeed in raising an interest, a real and deep interest with the members of this society, and that this year will bring registration nearer accomplishment. I want the country members to call meetings in their own districts, to come to the Society's meetings, for the calling and holding the meetings wherever possible will bring together a weight of opinion, which will demand the attention (as earnestly as other not more important, but possibly more important, questions do) of your representatives in Parliament. It is so often said by the more retiring men, and by those who have not so much self-assertion as others, and sometimes, too, no doubt as an excuse by those who wish to save themselves work, "Oh! What can I do? I have no influence or position!" That is not correct; all can at least influence his neighbour, all can help to make a meeting, and can at least communicate ideas to those immediately around him, and, as every grain is necessary to the formation of the whole stone, remember that even the smallest grain of your help is often of the utmost importance to the whole. Let me then again ask

the help of all members to push forward the great work of registration, and I would ask, too, that it be freely given, so that in a few years, I hope in the reign of our gracious Queen, we can look with pride on a work done for the public good, and for the elevation of the standing of the profession to which we belong.

Mr. W. R. MALLETT proposed a vote of thanks to the President for his instructive and suggestive address, in which he had dealt with many topics of immediate interest to the profession. Mr. Mallett added he would frankly admit that in earlier years he was opposed to the principle of registration; but now he saw it to be absolutely necessary for the profession, and also desirable in the public interests.

Mr. G. GARD PYE seconded the motion, which was supported by Mr. J. R. MANNING and Mr. COVENTRY DICK (who referred to the simple system of passing building plans adopted by the Scottish Dean of Guild Courts), and having been carried by acclamation, was acknowledged by the President, who laid stress on the need for more summary procedure with light and air cases.

"THE BROKEN CONTRACT."

THE conversazione marking the opening of the fifty-first session of the Architectural Association took place on Friday evening last at the Matinée Theatre (till recently known as St. George's Hall), Langham-place, W., and was attended by a very large number of members and their lady friends. The president, Mr. Hampden W. Pratt, and Mrs. Pratt, who were supported by the vice-presidents and council, held a reception from 8 till 8.45 p.m., and in the refreshment-room were hung a number of water-colours, representing English, Continental, and Egyptian landscapes and architecture, by Mr. R. Phené Spiers, F.S.A.; also sketches and measured drawings executed by the A.A. Travelling Student, Mr. E. Hallyer Evans, of Wimbledon; work done in the water-colour class by Messrs. R. H. Weymouth, John Ormrod, J. Humphreys Jones and C. H. Duke, and others. The photographs taken during the A.A. excursion in August last to Lancashire were also on view.

The attraction of the evening was not, however, the displays of architectural draughtsmanship or photography, but the musical play, in two acts, written by Mr. F. Dan Clapham, with music by Mr. Leonard Butler, entitled, "The Broken Contract: an Egyptian Enigma," on which the curtain rose at 8.45, when the house was filled to overflowing. The play was on a more ambitious scale than anything hitherto attempted by the A.A., and was excellently staged and managed. The plot was more coherent, and was more deftly elaborated than is usually the case in such burlesques; all the performers were letter-perfect in their parts, and the performance went off without a hitch. The writing was unequal, but here and there smart, and the versification showed a Gilbertian dexterity in many-syllabled rhymes; but while the personal allusions were less pungent than has sometimes been observable, every topical hit was instantly perceived and was greeted with applause by the audience. The *dramatis personæ* were:—Professor Stonechat, F.R.I.B.A., Mr. Alfred Stalman; three young architects—Stanley Chester, Mr. Stephanos Constanduros; Arthur Travers, Mr. H. Seton Morris; and Algie de Vere, Mr. A. G. Turner; Maude and Ethel, the professor's daughters, Miss Grace Wyld and Miss K. Rimell; Painehsi, the Court physician, Mr. Frank Collins; Pempi and Merimies, builders and decorators, Messrs. F. D. Clapham and G. B. Carvill; Setnub, a foreman, Mr. J. H. Wilson; Netchemet, lady's maid to the princess, Miss Blanche Selig; Karama and Napata, lady decorators, Misses Ada Yerbury and Ethel Atkins; and Princess Nephthis, daughter of King Amenemhat, Miss Mabel Engelhardt. The chorus of Egyptian lady decorators, builders' men and boys, was sustained by about a dozen young ladies and as many youths. The play was produced by Messrs. G. B. Carvill and F. D. Clapham, and the singing and dancing were accompanied by a very efficient orchestral band, conducted by the composer. The singing and acting of Mr. Constanduros, the youthful hero of the story, of Miss Engelhardt, the princess, and of Mr. Collins, the physician (who in make-up, manner, and gestures recalled to mind a distinguished professor-president in another place), must be especially singled out for commendation, and also Messrs. Clapham and

Carvill, the builders and decorators, whose delays gave occasion for the title of the story.

The curtain rose, displaying the interior of an Egyptian tomb, uncommonly spacious and well-lighted, by the way, for such a retreat, and therein were grouped the builders, their lady decorators, and foremen and workmen, together with the Court physician, a royal princess and her attendant maid. From the opening chorus and subsequent dialogue, it was to be gathered that for 4,000 years the party had been walled up by order of a king, himself long since deceased, for failing to complete the contract to build and decorate the royal vault within the appointed time—three months and three days. Fortunately for the entombed company the Court physician was accidentally immured with them, and by his magic arts was able to administer to each a potion that sent them to sleep for a hundred years, when they awakened for 24 hours and then resumed their slumbers. This being the 40th century, Painehsi recounts the facts, and reminds the peccant builders that immediately they obtained the contract they converted their firm into a limited company, whereunto was traceable the beginning of their downfall, for they ceased to take a personal interest in the work. Then they replaced the decorators who went on strike by lady students as being at once cheaper and more attractive. Unfortunately, the Princess Nephthis, who was an art amateur, was on a visit to the tomb, and with her lady's-maid and the physician suffered with the righteousness condemned when the king ordered the entrance to be built up as a time penalty. The princess had gained some distinction as a dabbler in art, having carried off prizes at the Thebes School of Art, and made "a more or less satisfactory towel-horse out of a lot of meat-skewers, painted with bright-red enamel," and her visit to the tomb was the outcome of a well-meant endeavour to teach the lady decorators their art—her scheme being to paint the whole interior a brilliant grass green, with a sacred bird here and there, in a stogy and conventional attitude. A fortune-teller had told the Princess that she should marry the man who should rescue her from a long imprisonment. After a duet and some amusing recriminations between the builders, the princess, in a pleasing ballad, expresses her regrets and hopes. On the expiration of the twentieth hour of the wakeful day, the imprisoned party decide once more to explore every corner and crevice of the tomb, when a digging and hammering are heard, and with a great burst of light, an old gentleman, in modern tourist attire, falls through a hole into the roof in the midst of the party, and at the very feet of the princess, quickly followed by three students and two young ladies, all in up-to-date costumes. In reply to the shouts of welcome and astonishment, the Professor explains that he is conducting an Egyptian exploration party, consisting of his daughters and three young architects, and that they have come upon the mummy of King Amenemhat, together with a papyrus in which was written the story of the strange disappearance of a Court physician and a young princess—a mystery the solution of which will afford pabulum for future lectures. The builders ask the professor's opinion concerning Egyptian masonry, and claim that no other firm could turn out work of such high quality; but on examining the plan he points out a serious discrepancy; the place where he came through, although specified and drawn as 10ft., proved to be only 4½in. in thickness. Pempi and Merimies are not easily floored—they lay the blame on a scamping foreman. The students enlighten the natives as to the difficulties in a modern architect's endeavours to obtain commissions during his early years of practice, and in an excellent song Stanley sketches the career of the successful and well-known architect. It is evidently a case of love at first sight between him and the princess; but, unfortunately, as Painehsi points out, she has promised to marry her rescuer, the penalty for a breach of this contract being, according to Egyptian law, death. Now her actual rescuer is old Professor Stonechat, who energetically protests that he is already married, and begs his daughters to keep the rumour of the suggestion from his wife. Both, in fact, refuse to fulfil the contract; but the wily Court physician refuses to hear of any evasion. They are given till noon of next day before the marriage must take place, or the princess be re-interred, and the curtain falls on a quintette by Arthur, Maude, the Professor, Stanley, and the princess, and chorus, in which the

hard fate of the princess and her rescuer are bemoaned.

In the second act the scene shifts to the exterior of the tomb, the white dome of a Cairene palace being seen in the distance through a carved lintel. Stanley avows his love for the princess, and implores her and her companions to devise some plan whereby they may be married. As Painehsi has decided to consult the oracle about the case, the princess suggests that the Professor shall be made up to represent that character. Somewhat reluctantly, Stonechat falls in with the plan, only stipulating that not a word is to be breathed concerning his metamorphosis to his wife or the Council of the Institute in England. While the Professor is being dressed for the part, Pempi and Merimies while away the time by singing a duet concerning "Cooking," of which the first verse runs:

You may perhaps have noticed what a lot of things are done

By cooking—yes, by cooking,
And it may be that a competition is very often won
By cooking—yes, by cooking.

On plan you find there's nothing underneath a three-foot wall;

A column in the attic perhaps has no support at all,
You can make your elevations to look either low or tall,
By cooking—yes, by cooking.

For it's really very funny
How imposing plans may look,
When handled by a man who
Understands the way to cook.

Another song by Netchemet, the Princess's maid, follows, also a recitative and chorus, and it is apparent that two other engagements have been formed—between Arthur and Maude and Algie and Ethel. At length, the professor, very much disguised, is posed as the oracle, and with no uncertain sound declares that the princess fulfils all requirements by marrying one of the rescuing party. All, therefore, ends happily, with a prospective hint of wedding bells, although it is undoubtedly a "Broken Contract," and as the curtain is rung down on the closing chorus, there were loud and enthusiastic demands from the audience for the "Author," which were acknowledged from the footlights by Mr. Clapham.

BUILDERS' BENEVOLENT INSTITUTION.

THE fiftieth annual dinner of this institution took place on Thursday, November 25, in the Carpenters' Hall, London-wall. Mr. Charles Wall (president) occupied the chair, supported by a numerous company, including Messrs. H. Holloway, F. Wall, F. J. Dove, T. F. Rider, H. H. Bartlett, A. Ritchie, J. P., B. J. Lone, A. Jacob, J. C. Preston (senior warden of the Carpenters' Company), J. H. Colls, W. B. Brown, J. Randall, T. Stirling, C. Russell, T. H. Griffiths, J. T. Bolding, F. Foxley, Nightingale, and Perkins.

The President gave the toasts of "Her Majesty the Queen" and "The Prince and Princess of Wales and the Rest of the Royal Family," which were received with enthusiasm.

Mr. J. C. Preston proposed "The Army, Navy, and Auxiliary Forces," which was responded to by Major Bruton, who added that he had now acted as secretary to the institution for the long period of 23 years.

The President, in proposing the toast of the evening, "Success to the Builders' Benevolent Institution," said that he was gratified to see so many present, which showed their interest in this useful charity. This was the Jubilee year of the Builders' Benevolent Institution, and, thanks to the generosity of those he saw around him and their friends, he believed it would be a great success. It did not require any particular eloquence on the part of the president to insure sympathy with the objects of the institution. In the walks of life some persons must always go under, and it was their bounden duty to aid those who, through misfortune, were not progressing so smoothly and so prosperously as their fellow-workers, and to see that they were comfortably cared for in their old age. This being the Jubilee year, as he had said, of the institution, the committee desiring to do something jubilant, had elected all the applicants who had been passed by them without a ballot. The charity required funds to allow it to carry on its useful work, and he was sure that he could commend it to the generosity of the trade.

The toast was drunk with enthusiasm.

Mr. F. J. Dove next gave "The Worshipful Company of Carpenters." He expressed the sincere gratitude of the members of the institution

to the company for their kindness in affording year after year the use of their fine hall, and in giving them a substantial annual donation. The company were also to be congratulated on the excellent technical work they were doing in connection with the building and kindred trades.

Mr. J. C. Preston (senior warden) returned thanks. The company were always glad to lend their hall for such a purpose as this, and it was a pleasure to see around him gentlemen whose names had been household words to many of them for years past.

Mr. T. F. Rider proposed the toast of "The President" in his usual humorous manner. The president of an institution like this, he contended, should be a genial man, a jovial man, and a generous man. Everyone, he believed, would admit the geniality of the president, they acknowledged his joviality, and they could all bear testimony to his generosity. It was unnecessary to add a single word to commend this toast.

The toast was very cordially received.

The President, in replying, said he considered it a privilege to be at the head of an institution like this, and he hoped that as time went on the younger builders would be encouraged to do what they could for the institution. He could not sit down without referring to the good work that Mr. George Plucknett (the treasurer), who was prevented from being present, had so long done for the institution.

Mr. J. Howard Colls, in proposing "The Architects and Surveyors," said that, in his opinion, the two bodies should be as distinct as possible. If there was anything worse than architects' quantities, it was quantity surveyors' architecture.

Mr. W. B. Church, in replying for the architects, said that they always endeavoured to do what was right as between client and builder. An architect's position nowadays was not altogether a bed of roses, for, with so many new materials and new ideas, he had to be a sort of walking encyclopaedia.

Mr. Northcroft replied for the surveyors, and referred to the fact that linen-draperies and upholsterers now dubbed themselves builders. If a man liked to be a retail tradesman he had every right to sell laces behind his counter, but he had no business to interfere with the legitimate trade of a builder, and, too often, with the unfortunate results he had sometimes met with in his experience.

Mr. H. Holloway gave the last toast, "The Vice-Presidents, Committee, and Stewards," which was replied to by Mr. Ritchie for the vice-presidents, and Mr. J. T. Bolding for the committee and the stewards.

In the course of the evening Major Brutton announced the list of subscriptions, which showed total donations amounting to £741, with £12 12s. of new annual subscriptions. The president's list showed a total of £599 14s., including a donation of 100 guineas from the president himself.

An excellent programme of music was performed by students of the Guildhall School of Music.

THE L.C.C. CONDITIONS OF CONTRACT: IMPORTANT MODIFICATIONS.

IN accordance with a recommendation by the special committee on the Works Department adopted by the London County Council, the General Purposes Committee of the Council have been considering what alterations should be made in the conditions which are imposed upon persons contracting for the Council's work. The committee now report a series of recommendations involving important changes in the terms of contract. In their evidence before the special committee several contractors strongly objected to the words inserted in contracts compelling them to observe "the rates of wages and hours of labour recognised and in practice obtained by the various trade unions." The committee now recommend the Council to make the clause read "recognised by associations of employers and in practice obtained by the trade unions." Some objection was taken to the radius within which the regulation as to wages and hours of labour operated. Under the old form of contract the radius is 20 miles, measured in a straight line from Charing Cross. The Institute of Builders have written suggesting that the radius should be altered to 12 miles, as that is the radius within which the agreement as to wages and hours of labour between the Central Association of Master Builders of London and the various unions operates. The committee have adopted the suggestion,

and recommend the council to alter the radius to 12 miles. Objection was also taken to the provisions giving the clerk of the Council power to direct examination of the books of anyone contracting for the Council. The committee now recommend that the power of examination should be limited to the time and wages books and sheets of the contractor. At the same time, they suggest that the money penalty clause for breach of this stipulation should be deleted. The committee further recommend that no alteration should be made in the clause relating to the employment of improvers and men with physical infirmities below the full rate of wages; but they express the opinion that in the event of a contractor employing a few of such men, and showing reasonable grounds for so doing, the Council would not press for penalties. No alteration is suggested in the clause with reference to the opening of priced bills of quantities; but the clause providing a penalty for the breach of the stipulation as to displaying at the works the schedule list of wages the committee suggest should be deleted. They also submit for the Council's approval a new arbitration clause. The committee are strongly of opinion that no outside arbitration should take place, except after the completion of the works, and have drawn up a clause to carry out that opinion. This report came before the County Council at their meeting on Tuesday, and, after a long discussion and several divisions, was adopted.

NOTES ON SURVEYING AND LEVELLING.—VII.

By WALTER TESTER.

THE intention now is, as shown on Fig. 4, to have a 3-lap cycle track and a $3\frac{1}{2}$ -lap running track, giving longer straights and making a better football field. The dimensions now are:—

Running track, $3\frac{1}{2}$ laps to the mile = 1,508ft. 6 $\frac{1}{2}$ in., and the semicircular ends being 130ft. radius, as before.

Length of one curve	408ft. 4 $\frac{1}{2}$ in.
Length of other curve	408 4 $\frac{1}{2}$
Length of one straight	345 10 $\frac{1}{2}$
Length of other straight	345 10 $\frac{1}{2}$

Total length on the 1ft. line... 1,503ft. 6 $\frac{1}{2}$ in.

Cycle track, 3-laps to the mile = 1,760ft.

Assuming for the present that the ends are semicircles, as before, 160ft. radius—

The length of one curve	502ft. 7 $\frac{1}{2}$ in.
The length of other curve	502 7 $\frac{1}{2}$
The length of one straight	377 4 $\frac{1}{2}$
The length of other straight	377 4 $\frac{1}{2}$

Total length on the line..... 1,760ft. 0in.

Width of the running-track 24ft. all round. Grass verge 6ft. wide on the straight, increasing around the curves on account of the difference in length between the straights of the two tracks, the latter not having the same centres for the semicircular ends. The cycle-track is now to be made 25ft. wide all round, except on the finishing straight, where it is to be 30ft., increasing in width from the points on the curved ends where the full banking begins to drop. There is to be a grass verge 4ft wide around the outer edge of the cycle track, and a barrier outside the verge. The cycle-track is to be banked up 8ft. 9in. on the curve above the level on the 1ft. line, which remains at 84.00 above Ordnance datum, as before and 1ft. above that level on the straight, the sections of the track being similar to the previous ones—that is, slightly round on the curves, and a straight line at the sides. This cycle-track is modelled on the system of M. Forestier, of Paris, the engineer for many of the leading French tracks, who was asked to supply a design for the New Brighton track. The edge of the barrier is to be kept a sufficient distance away from the building already existing on the additional piece of land, which is intended to be used as a club-house, and the barrier to be 36ft. away from the boundary on the south-east side. The cycle track at the north-east end is to be carried on steel girders, and underneath a building to be erected for a menagerie, aquarium, side shows, &c., necessitating a retaining wall to hold up the sand.

The surveyor has now an immense amount of work to get through, and it must be done as rapidly as possible, as the excavator has all his tackle, horses, and waggons ready to proceed with the work, and must on no account be delayed.

Previous to resetting out the tracks, he must take any notes and levels required for squaring up the quantity of sand or rock excavation done up to date from his sections, and, if necessary, he will have to take levels, and make an estimate of the further excavation caused by the alteration.

He must then proceed to reset out the tracks, and resection the site, and it must be understood that the ground is at this time in a very rough state, with heaps of sand and loose rock lying about, causing some difficulty in fixing the lines; but as there is a large flat space, as shown on the plan, Fig. 4, which is sunk down on to the formation level for the football field, he decides to utilise this to the best advantage. He commences by putting an accurate drawing of the tracks in their exact position on his survey plan, and having marked out a line, A B, on the site parallel to the boundary, he scales from his plan a dimension, A C, where the line through the centre point of the semicircular end of the running track cuts A B, afterwards setting it out on the ground. On the line A B he next marks any two points in such a position that two lines at right angles to A B will be clear of the large heap of loose stones stacked as shown on the plan, Fig. 4. Assuming that point C will serve for one of these, and calling the other D, at C and D he sets out with his theodolite two lines, C E and D F, square off the base, A B, and measuring out along these lines the distance to the longitudinal axis of the tracks, he marks two points, G and H, checking with the length G H.

He then produces H G 15ft. 8 $\frac{1}{2}$ in. to the temporary centre of the end of the cycle track, this distance being half the difference between the lengths of the running and cycle tracks, viz.:—

377ft. 4 $\frac{1}{2}$ in.
345 10 $\frac{1}{2}$
2) 31 5 $\frac{1}{2}$
15ft. 8 $\frac{1}{2}$ in.

From the centre of the cycle track he should run out a dimension to the nearest corner of the club-house to see that he has the requisite distance between the building and the barrier, and everything being correct, he can permanently fix the points G and H by driving iron bars into the rock. On the lines E J and F K the edges of the tracks should be marked at both the grand stand and popular sides, and two wires should be hung on to the iron bars at the centres for striking out the curved ends of the tracks. This is all the setting-out for this end that the surveyor can do at present, as he is anxious to proceed with the ground sections, the excavator having all his rail-roads in ready for work. For the menagerie end he produces the line G H with the theodolite, and fixes the centre point for striking out the circular retaining wall. The contour lines on the plan show the hill which has to be cut through at this end, and the retaining wall must be at once proceeded with, as the excavation from the bank is to be tipped against it up to the formation level. For measuring out the retaining wall, the ground at the centre point being considerably above the level at the wall, a convenient way of getting the measurements horizontal is to have a plumb-rule made similar to the ones used by bricklayers, but much longer, and to drive a row of nails firmly into the board.

As the radius to the inside of the wall is about 150ft., it will be best to have a wire made the required length with a loop at each end. A long iron bar being firmly driven down at the centre-point, one loop of the wire can be hung on to it, the other end of the wire being fixed over one of the nails in the plumb-rule, varying the height as the level of the ground changes by hanging it on to different nails, and the plumb-rule being fixed vertical, as many points can be marked on the ground as required. As the wire is a great length, it will have to be supported at intermediate points to prevent it sagging. This is not a very scientific method of setting-out the curve, but it will be sufficiently accurate for the lower portion, the wall being only a rough concrete one and to be faced with rockwork on the menagerie side; and as it must be accurate for the steel girders carrying the cycle track, it will have to be adjusted at the offset near the top from the correct centres for the ends of the cycle track, which will by that time be put in on the formation level.

The surveyor can now proceed with his sections. The plan, Fig. 4, shows the lines adopted, and requires little explanation. The only point that

placed at the extreme end of the line near the menagerie, and each of the other points is placed exactly on the line with the instrument. At the club house end the points have to be marked by iron bars driven into the rock. There will be no difficulty with the ends of the running track, as they are true semicircles; but the distance apart of the centre points should be checked and made correct on the formation level, and the pegs should be painted a different colour from those for the ends of the cycle track, to prevent mistake.

From the four points for the cycle track at each end the surveyor should set out with the theodolite the angles $75^{\circ} 36'$, $81^{\circ} 54'$, 90° , and 90° , retaining the lines on the formation level by posts and nails, or iron pegs, as the case may be.

PURE BITUMEN DAMP-COURSE AND SHEETING.

CALLENDER'S Pure Bitumen Sheeting has long been known as one of the best means employed to render buildings impervious to damp or water. Some bitumens are wanting in elasticity, and the artificial tar asphalt in the market are often easily fractured, and of no permanent value for the purpose of arresting moisture. Many architects know how damp-courses of artificial asphalt or tar crack, and are therefore useless. The pure natural bitumen made by the Callender's Cable and Construction Co., Ltd., of Belvedere, Kent, and Essex-street, Strand, is without any such admixture of tar or other products of an injurious kind; it is elastic and will not crack when bent by the settlement or fracture of a wall. It is made in lengths of 24ft. of any width up to 72in. wide. The illustrated catalogue of the company is an interesting little treatise describing and illustrating the Asphaltum Lake, Trinidad, from which this material comes, and giving many useful facts about the bitumen. For covering railway bridges of iron and brick, arches of masonry, the value of the pure bitumen sheeting is evident. Any of the artificial products would soon crack under the vibration from trains; but this sheeting, being elastic, yields easily, and becomes an impermeable laying, keeping the brickwork and piers quite dry. For the seatings of girders and columns in place of sheet lead; for lining storage and collecting tanks and reservoirs; for lining swimming-baths, protecting cellars; for introducing between concrete layers for reservoirs and basements; for flat roofs, and many other purposes, no material is better adapted. Admirable photo. illustrations give views of the Tower Bridge and piers; Carlisle Station; St. Enoch Station, Glasgow; Forth Bridge, and other buildings in which Callender's pure bitumen sheeting has been used. The mode of laying vertical damp sheeting in basements and vaults likely to be flooded is shown by sections. Many houses and basements that have been rendered uninhabitable by the recent floods might have been saved by the employment of horizontal and vertical linings of this bitumen, which is also used for sewer and pipe-jointing. Messrs. Callender and Montgomery, Essex-street, Strand, supply the material.

IRON AND HARDWARE.

THE illustrated catalogue of Messrs. Colledge and Bridgen, iron and hardware merchants and lock manufacturers, of Church-lane and Powlett-street, Wolverhampton, will be found a useful illustrated *répertoire* for builders and architects in specifying. The locks of this firm have a wide repute, and have been used in great hotels at Brighton, Dover, Folkestone, and in many in London; also hospitals, town-halls, institutes, banks, schools and other buildings. These comprise two-bolt rim-locks, double-handed locks, wrought case rim-locks, also of brass; stock-locks, drawback, mortise locks, &c. The upright mortise-locks and night-latches are very secure and neat. The automatic sliding-door mortise-lock is effective, and these are made in great variety and size and of various prices. The illustrations, which are very numerous, include door furniture, finger-plates of brass, ebony, and oak, lock-plates of richly modelled and chased designs, iron bolts of all kinds, patent shelf-fittings, door-knockers, ventilators, and other builders' ironmongery. An alphabetical index makes the catalogue a complete price-list of locks and builder's hardware, which can be easily referred to.

COMPETITIONS.

BLACKBURN.—From the designs sent in for a new infant school in Dean-street, Blackburn, the building committee have selected those of Messrs. Cheers and Smith, of Richmond-terrace, Blackburn, for the first place, and these architects have been instructed to carry out the work. Mr. J. W. Shorrocks, of Simmons-street, was awarded the premium for second place.

BYFLEET.—Ninety-two sets of drawings have been sent in for a village hall and workmen's club to be built at Byfleet, Surrey. The referee, Mr. W. H. Seth-Smith, has decided in favour of the design under the motto of a "Red Star" as most completely fulfilling the conditions and other requirements of a village hall, and recommends that it should be awarded the premium of 25 guineas. The authors are Messrs. Ashley and Armstrong, of 50, Berners-street, London, W. The referee adds the following to his award: "May I be permitted to suggest that, in inviting tenders for the building, builders only of standing be invited to compete."

EDINBURGH.—At a meeting of the Public Health Committee of Edinburgh Town Council on Monday the competitive schemes, which had been lodged with the City Superintendent of Works for the heating and ventilation of the City Hospital, were submitted. A premium of £50 had been offered for the most suitable scheme. Thirteen schemes had been sent in, and, after consideration, they were remitted to a sub-committee for report, power having been given to employ an expert.

HARRISBURG, PENN.—The Pennsylvania Capitol Competition Case came before the Supreme Court of the State on an appeal from the decisions of the Dauphin and Lancaster County Courts taken in the cases of Messrs. Cope and Stewardson, of Philadelphia, Alden and Harlow, of Pittsburgh, and James H. Warner, of Lancaster, against the Capitol Building Commission. Justice Mitchell dismissed the appeals and sustained the decisions of the lower courts. The decision is regarded as removing all cause for further delay in the building of the Capitol, for which Mr. Henry Ives Cobb, of Chicago, has been appointed architect, as heretofore noted in these columns.

LONDONDERRY.—An adjourned meeting of the Londonderry District Asylum Board of Governors was held on Nov. 25, to meet a deputation from the Board of Control for the purpose of conferring respecting the plans for the new asylum at Gransha. The Right Rev. Dr. Chadwick, Bishop of Derry and Raphoe, presided. The members of the Board of Control in attendance were:—Dr. O'Farrell, Dr. Courtney, and Mr. S. Usher Roberts, C.B., their consulting architect. Dr. Hetherington, resident medical superintendent of the asylum, read a letter from the Board of Control and a resolution of the governors. The resolution drew the attention of the Board of Control to the fact that the accepted plans in the recent competition for architectural designs for the Gransha Asylum meant a large excess of expenditure above the sum which it was originally agreed the new buildings were to cost. The Board of Control were asked as to whether a modification of the plans for economic purposes could not be made, and a reply was received that one of the architects declined to modify his plans, as it was a practice contrary to professional etiquette. The inspectors and the consulting architect from Dublin were then shown into the boardroom, and the chairman, addressing them, said the governors were met to ascertain what help the deputation could give them, so that they would be enabled to have the new building carried out on the understanding that it would not exceed a certain fixed sum when completed. The sum of £102,000 was the amount at first computed to cover the cost, but it had since been raised to £110,000, beyond which the governors could not go. Dr. O'Farrell said that when the inspectors were in Derry and met the governors on the last occasion, it was decided that the two successful architects, who were placed first and second in competition, were to be asked to revise their plans and bring them within the limits of expenditure. The Board of Control were at one with the governors in limiting the expenditure, and they were quite determined that the cost of the new asylum buildings shall not exceed £110,000. However, the negotiations to have the accepted plans revised

have fallen through, inasmuch as one of the architects, Mr. Byrne, refused to amend his plans, moved by professional etiquette to refrain from so doing, and probably also influenced by a feeling of personal honour, which did him the greatest credit. He had, at any rate, refused to enter into any further competition, and so there only remained the architect's plans who was placed first by the assessor, and as the estimate for the work was very high, the deputation came down to confer with the governors as to what steps should be taken next. Mr. Scott proposed:—"That the estimate of plans being in our opinion excessive, no further steps be taken at present in reference to the new asylum." He said he had no wish to postpone this matter indefinitely. He did not intend that there should be more than six or twelve months' delay. Colonel Knox seconded the motion. Dr. O'Kane proposed as an amendment, "That we employ an architect with instructions to make a plan of a new asylum not to exceed £110,000, and that as Mr. Byrne is a competent architect, that he be appointed." After some further discussion, the following decision was come to, on the motion of Mr. Stevenson, seconded by Rev. Thos. Thompson:—"That Messrs. Owen and Byrne, or failing the latter, Messrs. Owen and Fuller, be requested to prepare plans in accordance with the suggestion of the Board of Control at a cost not exceeding £110,000 to accommodate 600 patients, such plans to be submitted to a future meeting of this board for its consideration." The proceedings then terminated.

NEW YORK PUBLIC LIBRARY.—The jury of award have decided unanimously that the design of Messrs. Carrère and Hastings, of New York, shall be the one used in building the new Public Library building on the site of the old reservoir. This is the result of the second competition, in which 12 architects took part. The jury placed second the design of Messrs. Howard and Cauldwell, and third those by Messrs. McKim, Mead, and White. The work of preparing the plans for the building has been going on for more than a year, and two competitions were held, both of which were conducted with the greatest care and fairness. Eighty architects competed in the first competition, and twelve of them were given premiums. Six of these prize winners were selected and asked by the committee to compete with six architects, with the result given above. The building is to cost about £340,000 sterling. Messrs. Carrère and Hastings have also been awarded the only premium in the competition for the National Academy design at New York.

WALSALL.—At the last meeting of the School Board the adoption was unanimously agreed to of the plans marked "Square" for the erection of the proposed schools at Whitehall, in accordance with the recommendation of the General Purposes Committee. It was explained that the Board, taking a new departure, had had the assistance of Mr. Chatwin, Birmingham, as assessor, and that he had placed the "Square" plans first—a decision which was entirely in harmony with the judgment of the Board. The plans were found to be the work of Messrs. Bailey and McConnal, Walsall.

The Workington Town Council have resolved to contribute £100,000 towards the cost of constructing a new deep-water dock. The estimated cost is £300,000.

The Lords of the Committee of Council on Education have promoted Dr. Hoffert to be a senior inspector under the Science and Art Department, and have appointed Mr. S. J. Cartledge—at present headmaster of the Hanley School of Art—to the vacant inspectorship.

The new waterworks which have been constructed by the Evesham Rural District Council at Broadway for providing a large number of adjacent villages with an adequate and continuous supply of water were publicly opened on Friday by the Earl of Coventry. The scheme is stated to be the largest and most important of its kind ever undertaken by a rural district council in the United Kingdom. Mr. J. Edmund Wilcox, C.E., of Birmingham, is the engineer. The works have been carried out by Mr. Thomas Vale, of Stourport, whose contract was for £6,190. The iron pipes were supplied by Messrs. J. and S. Roberts, of West Bromwich, whose contract amounted to £6,062. The valves and fittings were supplied by Messrs. Blakeborough and Co., of Brighouse, Yorkshire. The resident engineer, Mr. Henry C. Adams, has superintended the works throughout.

BURY ART GALLERY AND PUBLIC LIBRARY.—PADSTOW HOTEL.—THE PASSMORE EDWARDS PUBLIC LIBRARY, SOUTHWARK.—MEMORIAL Lych GATES AT BAXTERLEY.—NEW PREMISES FOR THE BIRMINGHAM PHOTOGRAPHIC CO.—SALOON IN A COUNTRY HOUSE AT GRATZ.

Our Illustrations.

SELECTED DESIGN FOR ART GALLERY AND FREE LIBRARY, BURY.

We publish to-day the view, plans, elevations, and sections of the Bury Art Gallery selected design by Messrs. Woodhouse and Willoughby, of Manchester. The arrangement of the art galleries is *en suite*, well contrived for supervision, and all steps are avoided. The lavatories are contiguous to the entrance hall, and are well screened from view. The entrance hall forms a sculpture gallery, and affords space for crush room. The exhibition rooms are lofty and well lighted. A curator's room is provided, and ample storage is located in the basement. The architects claim that the elevations are the natural expression of the plans, and no sacrifice of internal convenience or economy has been made for the sake of artistic effect. The staircase is 6ft. 6in. wide, and has a large mullioned window to light it. The entrance to the library is 13ft. wide, direct from the street. The library is well planned, and is amply lighted. The elevations, treated after the manner of the Renaissance style, are to be executed in Aspatia (Cumberland) red stone. The cost is estimated at £16,000. We shall give illustrations from the other promiated designs next week.

PADSTOW HOTEL.

This hotel is to be erected on the north coast of Cornwall, a locality well-known to visitors during the summer months, and now recommended by the medical profession as a winter resort, rivalling in a sense the Riviera for its mild and equable climate. As shown on the plans, the hotel comprises, on the ground floor, the reception-rooms, and on the first and second floors 30 bedrooms for visitors, in addition to private sitting-rooms and suites. The lower ground-floor, which, in consequence of the sloping nature of the ground, is not above the ground level, contains all the administrative part of the hotel and the billiard-room and lavatories. The materials for the walls will be local stone, rough from the quarry near the site, and the roofs will be covered with thick rough slabs of Delabole slate, local materials being used to harmonise with the rough and rugged nature of the surrounding country. Internally, the finishings will be simple, comfort and convenience being their principal features. The hotel is being built for Mr. Alfred Curphey, of 28, Victoria-street, Westminster, and the architects are Messrs. Crickmay and Sons, of 13, Victoria-street, Westminster, and Weymouth.

THE PASSMORE EDWARDS PUBLIC LIBRARY, BOROUGH ROAD, S.E.

The foundation-stone of this library was laid yesterday by the donor, Mr. J. Passmore

Edwards. The building, which is now in course of erection, occupies a corner site on the north side of the Borough-road, within a few yards of St. George's-circus. It is set further back than the sketch indicates, and it is the intention of the Commissioners to turf and plant the space between the building and the boundary walls. On this space will be placed stands, on which the advertisement sheets of newspapers can be fixed before the library is opened in the morning, for the convenience of those who wish to refer to them as early in the day as possible. The building consists of a basement with two floors over. In the basement space is provided for the storage of books and papers, and a certain portion will be set apart for repairing and unpacking rooms. This basement is well lighted by an area which extends completely round the building. On the ground-floor are the newsrooms, lending library, ladies' room, and boys' room, all of which are under the direct supervision of the staff engaged in the lending library. There is also a private entrance for the librarian and the staff. On the first floor is the reference library, with book-store attached, the committee-room, and a portion of librarian's residence, the remaining part of which is on the attic floor above. The residence comprises drawing-room, dining-room, three bedrooms, bath-room, kitchen, scullery, &c. The front and two end elevations are of red brick with terracotta dressings. The west-end gable terminates in a memorial of H.M. the Queen, in low relief. The figure subject over the entrance is illustrative of Art, Science, Literature, and Music; and that in the gable over includes the Tree of Knowledge, with crowning figure of Wisdom and the Arms of the City of London. The shields on either side bear respectively the Arms of Bermondsey Abbey and the Badge of Vestry of St. George-the-Martyr, Southwark. The architects are Messrs. C. J. Phipps and A. Blomfield Jackson, 26, Mecklenburgh-square, London, from whose designs the building is being erected by Messrs. J. Smith and Sons, of Norwood.

MEMORIAL CHURCHYARD GATES, BAXTERLEY.

THESE gates have been erected in memory of the late Vice-Chancellor Bacon. The lych-gate stands at the main entrance to the churchyard, with a small swing-gate at the side leading to a public pathway across the burial ground. The smaller gate is placed at the opposite end of the pathway. The whole of the woodwork is in English oak, and the roofs are covered with stone slabs. The architect is Mr. Alfred Bickerdike, of London.

NEW PREMISES, STECHFORD.

This building has been erected at the corner of Albert-road and a new road at present unnamed at Stechford, a rural district about four miles from the city of Birmingham. The offices are arranged in such a position as to enable the whole of the departments to be supervised and controlled therefrom. The upper floor is almost a repetition of the ground floor; the walls are faced externally with wire-cut local bricks dressed with Monk's Park stone. The general contractor for the work, which has cost about £4,000, is Mr. J. W. Smith, of Small Heath, Birmingham; Messrs. Rosser and Russell, Limited, of London, and Colmore-row, Birmingham, have undertaken the heating arrangements, and the whole has been erected from the plans prepared by and under the superintendence of Mr. F. Edwards, architect, 1, Newhall-street, Birmingham.

SALOON IN COUNTRY HOUSE AT GRATZ, AUSTRIA.

THE chief feature in the apartment herewith illustrated is the handsome doorway, of grand proportions, which is of wood, decoratively treated on the flat surfaces, such as the panels and stiles of door. A high panelling is carried round the room, and a wooden ceiling, deeply coffered, is just in the view, the cornice to same being divided by an alternate cartouche and bracket. The floor is of simple design in parquetry, and the chairs, of a good plain Italian character, are further items of interest. The architect is Herr Karl Lacher, and our drawing is taken from the pages of the "Weiner Bauten-Album."

Extensive additions have been made to the Wesleyan Chapel at St. Day, Cornwall, including an organ-chamber and orchestra, with choir vestry, &c., beneath. The work has been carried out by Messrs. Moyle, Chacewater, and Gray, Redruth, from plans prepared by Mr. S. Hill, architect, Redruth.

Engineering Notes.

THE SOUTH WALES DIRECT RAILWAY.—The first sod of this railway was cut by the Duchess of Beaufort on Monday. The new line, which is being built by Sir Weetman Pearson for the Great Western Railway Company, will be 33½ miles long, from Wootton Bassett to Patchway, a few miles below the Severn Tunnel, including Filton loop and the junction loop with the Midland Railway near Yate. By means of it the distance from London to Newport, Monmouthshire, will be reduced to 132 miles, as compared with 143 *via* Bath and Bristol, and 158 miles *via* Gloucester. The average gradient from London to Newport will be but 1 in 300. The construction will involve the making of three tunnels; the first, through the Cotswold between Acton Turville and Chipping Sodbury, being 2½ miles long, the second near Alderton, a quarter of a mile, and the third, near Wootton Bassett, an eighth of a mile. Four viaducts and about 100 bridges will be constructed, and there will be the seven stations following—Brinkworth, Somerford*, Hullavington, Badminton*, Chipping Sodbury*, Coal Pit Heath*, and Winterbourne. At such of these as are marked with an asterisk there will be four running lines, so that expresses may pass through along the middle line while a stopping train is at rest at the platform. The work is expected to cost one and a quarter millions, and will be concluded in about three years. Mr. Inglis, the chief engineer to the Great Western Company, prepared the plans, and the contractor will be represented on the works by Mr. George Hay.

CHIPS.

Mr. L. A. Salby-Bigge, assistant Charity Commissioner, held an inquiry at the Guildhall, Looe, on Friday, in respect of an application from the trustees of West Looe Trust Property for permission to borrow the sum of £1,800 for providing a new water supply.

The new Technical Institute for Grantham and district is nearly completed. The institute is at the rear of the Guildhall, and was formerly a gaol, afterwards being used as a cigar factory. Mr. F. J. Morris (the borough surveyor), planned the alterations, which have been carried out under his superintendence by Messrs. Walker Bros. and Parks, the contractors.

Extensive additions and alterations have been made to 31, George-square, Edinburgh, to provide a residence for lady students and a "union" for all the ladies attending the University. These have now been completed, and the Masson Hall, as it has been called, was formally opened on Friday by Miss Balfour, of Whittinghame. The present scheme gives accommodation for 15 resident students. Mr. James Jerdan, Castle-street, Edinburgh, was the architect.

At the annual meeting of the Lancashire Asylums Board, held at Preston on Friday, it was reported that the tender of Messrs. Robert Neill and Sons, of Manchester, for the erection of the new asylum at Winwick for the sum of £253,000 had been approved. The chairman said the patients' blocks would be completed in about two and a half years, and the whole building in three and a half years. They would be able to receive patients in about two and a half years. It was resolved to grant £5,900 for purposes of enlargement at Rainhill Asylum, and £7,500 for altering and relaying the drains and treating the sewage at Whittingham Asylum, where it is intended to substitute water-closets for the pail system which has prevailed hitherto.

The lighting apparatus in the tower at Tod Head, Kincairdineshire, has now been fitted up under the superintendence of Mr. Burness, inspector of lights for the commissioners. The light is a flashing one, showing six flashes in quick succession during a period of about 15 seconds, followed by a period of darkness of 15 seconds. It was designed by Messrs. Stevenson, civil engineers, Edinburgh, and constructed by Mr. Henry Leparte, Paris, and Messrs. Milne and Sons, (Limited), Edinburgh. The apparatus makes one revolution in half a minute.

At Windisch, the old Roman colony of Vindonissa, in the Swiss Canton of Argovie, excavations recently carried out under the auspices of the Swiss Archaeological Society have yielded important results. Large Roman villas and an amphitheatre have been discovered, and, besides a large quantity of coins, pottery, bronze, and ironware, some large silver vessels have been discovered which are said to only have their equals in the famous treasure-trove of Hildesheim in Germany, brought to light in 1868.

Building Intelligence.

ANNAN, N.B.—For some time negotiations have been in progress between Messrs. Cochran and Co., the well-known engineers and iron-founders, of Birkenhead, and the representatives of Mr. Mackenzie, of Newbie, for a site at Annan to establish engineering works on a large scale. The negotiations have now been all settled as between the firm and the proprietor of the Newbie estate. Messrs. Cochran and Co. have decided to remove their entire works from Birkenhead to Annan. The site selected is the harbour at the mouth of the River Annan, and opens right into the Solway Firth. The land marked out for the works extends to 13½ acres, and lies on the west side of the river. A railway siding at present connects the projected works, and joins the main line of the Glasgow and South-Western Railway, half a mile to the west of the railway station at Annan. The Board of Trade has just granted powers to the harbour trustees to convert the harbour into a public port. Two hundred dwelling-houses are to be immediately erected at the works for the accommodation of the employes of the firm. The works have to be pushed forward with all haste, as the firm have entered into possession of the ground this week.

EDINBURGH.—The opening of the McEwan Hall at Edinburgh University takes place this (Friday) afternoon. The hall, which we shall illustrate shortly, has been built from designs by Dr. Rowand Anderson, of Edinburgh, the architect of the University buildings, and has cost the donor, Mr. W. McEwan, M.P., about £70,000. It is seated for 3,000 persons, and is on plan semicircular, being based on the form of an ancient Greek theatre. The steel roof, which has a distance of 134ft. by 106ft., was specially designed by Messrs. Cunningham, Blyth, and Westland, civil engineers, Edinburgh. The decoration of the hall has been carried out by Mr. W. M. Palin, of London, who has been engaged for about four years on the undertaking; some of the full-length figures in the dome panels were illustrated in our issue of December 11, 1896, and January 22, 1897.

MANCHESTER.—A scheme for providing additional workmen's dwellings, now under the consideration of the Improvement Committee, has been rendered necessary by the demolition of property for public improvements in Gaythorn and Rochdale roads. The committee have two sites in view. One, at Miles Platting, was secured some time ago, and upon this the erection of some 60 cottage houses is contemplated. A second site is near Moston-lane. The ground already belongs to the Sanitary Committee, and the City Surveyor has been asked to report upon its suitability. A further scheme, which has already been sanctioned by the Council, relates to dwellings to be erected upon cleared land in Pott-street (Ancoats), Oldham-road, and Chester-street (Hulme). It also provides for a lodging-house in Harrison-street, Ancoats. The committee will shortly invite tenders for the erection of these dwellings.

PARTICK.—On Saturday the memorial-stone was laid of a United Presbyterian church, which is being erected at the corner of Lawrence-street and Alexandra-street, Partick, near Glasgow. The style adopted is 13th-century Gothic, with massive treatment, and simple and severe detail. Between the main gable and that of the hall is an octagonal turret, forming the gallery and hall-staircase. The halls and accessory-rooms are placed to the west of the church. The side elevations of the church show a series of low four-light windows with square heads in the lower stage, and in each bay over these, divided by broad piers, are tall two-light windows of lancet shape. The organ chamber is projected in the chancel form to the north. Internally, the nave is divided from the aisles by splayed stone piers, one only on each side, springing from which are moulded arches of wide span. The principal roof timbers will be shown, and the ceilings will be lined with wood panelling. The number of sittings provided is 740, and there are also halls for 400 and 200, classrooms, ladies' room, vestry, kitchen, &c. The cost will be £7,500. The architect is Mr. John B. Wilson, Glasgow, Mr. Thomas Todd acting as clerk of works.

SANDBACH.—The formal opening of the Marriott House and grounds, which were presented to the town for the purpose of technical schools and park by the Marriott family, took place on Tues-

day week. The house has been rearranged inside, and wholly overhauled and renovated. The ground floor consists of a large room at the front, which is used for dressmaking classes; a smaller room for the use of classes; a room for the carving class, out of which there has been thrown a square bay window; the whole of this room has been fitted with benches; and a room for teaching laundry work and cookery, and four caretakers' rooms are provided. We must not omit to refer to the entrance-hall and cloakroom, from whence rise the handsome old stairs, which are very fine indeed, being made of English oak, with dado on the wall side. There is also a side entrance from the garden. Upstairs there were originally four bedrooms on the front, which have been converted into one large classroom, fitted with a set of sliding partition glass doors, dividing it into two rooms when necessary. When these are thrown open it gives a room measuring 60ft. by 16ft. 3in. The alterations have all been designed by Mr. Alfred Price, architect, of Elworth.

CHIPS.

Lieutenant Colonel Albert C. Smith, R.E., one of the Local Government Board inspectors, held an inquiry on Friday at the Croydon Town Hall respecting the application of the council to borrow £13,450 for street widening and extension of the electric lighting works, the demand for electric lighting exceeding expectation.

A Divisional Court of Appeal was asked on Friday to decide the principle upon which the value of public-houses taken for the purposes of the southern approach to the Tower Bridge should be ascertained. The judges (Justices Wright and Kennedy) were of opinion that the arbitrator should consider the value of the tied covenant of the lease, and not the takings and payments of the lessee.

Mr. John Cassidy, sculptor, has just completed a statue of the late Dr. James Dorrian, the well-known philanthropist of Bolton, which, as the inscription on the base will record, is to be "erected by public subscription to commemorate a life of usefulness." The statue, which is of heroic proportions, and is hewn out of a block of Portland stone, represents Dr. Dorrian standing with his arms folded, one hand clasping a book.

At St. Mary's (Welsh) Church, Aberystwyth, a window erected to the memory of the late Dean of St. David's (Dr. Phillips), formerly vicar of the parish, was recently unveiled. It is of stained glass, is placed on the north side of the nave, and consists of two figures, those of St. Mary and St. David. The design was carried out by Mr. A. O. Hemming, of Margaret-street, W.

Mr. Alfred Waterhouse, LL.D., R.A., has been elected treasurer of the Royal Academy in the place of the late Mr. J. C. Horsley. Another architect, Mr. T. J. Jackson, R.A., ran him close for the appointment, which was only determined in Mr. Waterhouse's favour by the casting vote of Sir Edward J. Poynter, the president.

While following Lord Fitzwilliam's hounds near Maltby on Wednesday week, Mr. George A. Wilson, surveyor and architect, Sheffield, rode at a fence along which, unknown to Mr. Wilson, were two strands of barbed wire. The horse caught its feet, and Mr. Wilson was flung out of the saddle. He had to be conveyed home in an ambulance, a subsequent examination disclosing the fact that he had sustained a slight concussion of the spine. Mr. Wilson is secretary of the Rotherham Race-course Company, and has been most active in trying to abolish barbed wire in the Fitzwilliam hunting country.

The annual distribution of prizes and certificates in connection with the Salisbury School of Art took place on Thursday evening in last week, when an address on art and technical education was delivered by the Earl of Carlisle. The annual report stated that good work was being done in the school under the tuition of Mr. Joseph Harris, the headmaster.

Mr. Thomas R. O'Connor has offered to present a two-light stained-glass east window to Clonfert Cathedral, in commemoration of the Queen's Diamond Jubilee. He also contemplates presenting the cathedral with a carved oak pulpit.

Mr. Henry Clarke, a member of the Corporation, having expressed a desire to contribute a painting of the value of one thousand guineas, commemorative of the Queen's visit to the City, for the Art Gallery at Guildhall, the commission has been intrusted to Mr. A. C. Gow, R.A. The picture will represent the Jubilee service outside St. Paul's Cathedral, and include the whole of the façade of the cathedral and the personages assembled there, including the cavalcade of princes. The work will not be completed until 1899, when it is expected that it be included in the exhibition of the Royal Academy.

Sir Walter Besant opened, on Wednesday, the new residence which has been erected in the Barking-road, Canning-town, for the accommodation of workers attached to Mansfield House University Settlement.

A stained-glass window of three lights representing in the centre our Lord as the Good Shepherd, and on either side the figures of the Virgin and Mary Magdalene, has been placed in the chancel of the parish church of Burlescombe. The work was executed by Mr. F. Drake, of the Close, Exeter.

The Metropolitan Asylums Board have accepted the tender of Messrs. D. and J. Tullis for the laundry machinery and fittings, in connection with the Grove Hospital at Tooting-hill.

At Wallasey Petty Sessions, on Friday, an architect named John Chopping, of 29, St. Elmo-road, Egremont, was summoned by the Wallasey District Council for using the Egremont Ferry, not being a contractor, otherwise than by the turnstile, on the 10th and 11th inst. An inspector proved the case, and stated that defendant gave a false name and address when challenged. A barrister appeared for the absent defendant, and, admitting the facts, pleaded that defendant was absent-minded, and it was through this physical failing that he had committed the mistake. Defendant was ordered to pay a fine of 40s. and costs for the first offence, and 20s. and costs for the second, £3 17s. in all, or go to gaol for 14 days on each charge.

A Local Government Board inquiry into the application of the Exeter City Council for leave to borrow £40,000 for the construction of the septic system of sewage disposal, invented by Mr. D. Cameron, the city surveyor, was held on Tuesday, Wednesday, and Thursday of last week, before Gen. Crozier and Dr. Thompson, at the Guildhall.

Last week was a satisfactory one at the Auction Mart, the aggregate amount of sales effected being £133,948, which compares favourably with the amount registered in the corresponding week last year—£104,621. The most encouraging feature of the market was the improved demand for land possessing elements of value for building purposes. Two or three years ago this class of property was almost a dead-letter, but a different state of things now prevails. Speculative enterprise has revived, and a considerable amount of capital has been forthcoming for investment in estates near London, offering facilities for the creation of ground-rents or for retail re-sales.

Dr. von Sallet, the well-known Berlin Professor of Numismatology, and especially famous for his works on medals by Albert Dürer, died on Thursday in last week, aged fifty-five.

The total number of private Bills of which notice has been given for next session is 335, 44 being promoted by county councils, corporations, and other public authorities, and 78 by dock and railway companies; 54 relate to gas and water undertakings, 11 to tramways, eight to harbours and navigation works, 86 to electric lighting provisional orders, and 29 are of a miscellaneous character. Thirty-six of the Bills directly affect the Metropolis.

The Edinburgh Town Council adopted, on Tuesday, a report from the electric lighting committee recommending large extensions of the electric lighting system in the city, the capital involved being about £20,000. The council sanctioned the acquisition on feu of ground for a new power station at M'Donald-road, and authorised the convener (Baillie Mackenzie) to go to London to consult with Professor Kennedy as to considerable additions to the machinery.

The Bristol memorial of Bishop Ellicott's episcopate in the diocese of Gloucester and Bristol, which extended over a period of thirty-four years, is to be a reredos in Bristol Cathedral, designed by Mr. John L. Pearson, R.A. The cost will be £2,400, and nearly the whole sum has been subscribed.

One of the principal railway schemes promised to be brought forward next session will now lie in abeyance, the Wirral Railway Company having failed to deposit plans in time, in connection with their notice of application for Parliamentary powers to extend their system to Rhyl. It was proposed to throw a cantilever bridge over the Dee estuary from Hoylake to Point of Ayr, a distance of three miles and a half, and thus open up the Dee estates (Mr. Hooley's recent purchase) and a considerable extent of virgin country, the journey from Rhyl to Liverpool being reduced from 50 to 24 miles.

The insurance companies affected by the recent fire, who are associated in the loss on the bulk of the buildings destroyed, have intrusted the adjustment of the claims against them to Mr. Robert Willey, F.R.I.B.A., surveyor to the Hand-in-Hand Insurance Company, of 33, New Bridge-street, Blackfriars, and J. R. Cooper, F.S.I., the senior partner of the firm of Ventom, Bull, and Cooper, surveyors, 35, Old Jewry, E.C.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

BIRMINGHAM MASTER BUILDERS' ASSOCIATION.—The annual meeting of this association was held on Thursday, Nov. 25, at the Grand Hotel, Birmingham, Mr. B. Whitehouse (president) in the chair. Among those present were Messrs. C. H. Barnsley, John Bowen, J. Goodman, J. S. Surman, T. Hallgarth, G. Raby, Alfred S. Smith, Albert S. Smith, R. Newell, J. Archer, F. J. Whittall, G. Trentham, R. Bulley, J. B. Whitehouse, and W. S. Edwards (acting secretary). The committee, in their report for 1897, recorded the continuance of the improvement in the general state of trade of the country referred to in their last report. The building trade had to some extent participated in that improvement; but contractors had been seriously handicapped by the increased prices of all materials. In November last notices were received for alterations in the rules from the carpenters, bricklayers, masons, plumbers, plasterers, and labourers, the labourers being the only branch asking for an increase in wages. A general meeting of employers and operatives was held on January 13, to endeavour to make the notices received as to hours of work and paytime uniform. That end was practically attained, and uniformity on those two points was imperative. Notices had again been received from the carpenters, masons, plasterers, plumbers, and labourers, asking for alterations of rules and a considerable advance of wages. These notices would receive the careful consideration of the committee. The Workmen's Compensation Act would throw serious responsibilities on employers, and a circular would be issued to architects suggesting the addition to bills of quantities of a clause making provision to cover the enormous risks incurred by contractors under the Act, which will come into force next year. The balance-sheet showed total receipts for the year £130 4s. 6d., which, with the balance from last year, made a total of £270 3s. 7d.; and the various disbursements were £117 7s., leaving a sum of £152 16s. 7d. to the credit of the association. The chairman moved the adoption of the report and the balance-sheet. Mr. C. H. Barnsley seconded the motion, which was carried. On the proposition of the chairman, seconded by Mr. Albert Smith, County Alderman J. Bowen was elected president for the ensuing year. Mr. F. G. Whittall was elected vice-president, Mr. G. Twigg, treasurer, Mr. E. J. Bigwood, secretary, and Messrs. T. Johnson and J. S. Surman, auditors. The annual dinner was held in the Grosvenor Room at the Grand Hotel in the evening. Alderman John Bowen presided over a large attendance. Mr. J. C. Nicol submitted "Success to the Birmingham Builders' Association," to which the president responded. Other toasts were "The Architects and Surveyors," proposed by the president, and replied to by Mr. C. E. Bateman; "The National Association of Master Builders of Great Britain," proposed by Mr. Alfred S. Smith, and replied to by Mr. C. H. Barnsley; "The Vice-President and Officers," proposed by Mr. Albert S. Smith, and replied to by Mr. F. G. Whittall.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—Mr. Stephen Adam, of Glasgow, delivered a lecture before this society on Monday evening, on "Stained Glass—Mediæval and Modern: its History and Varied Processes." Mr. W. H. Bevers presided. Mr. Adams proceeded to give a short history of glass-staining from the 10th to the 19th centuries, pointing out the features of the Mediæval as compared with the modern. He strongly advocated the mosaic method of the 12th and 13th centuries, which, he said, was the only style fitted for permanent work. He went on to describe the various processes of glass-staining. In the simplicity of the material, he said, lay its durability. Thanks to science, the modern glass-stainer had material at his command which compared with, if it did not excel in beauty, that used in ancient days. It might be said with some truth that there was nothing in art or nature that was imperishable, but certain stained-glass windows of the 10th, 12th, and 13th centuries, in English and Continental cathedrals, told, in glowing mosaic colours, through which the light of centuries had streamed, that stained glass could be "a joy for ever," long after tombstone memorials had crumbled into dust.

MANCHESTER SOCIETY OF ARCHITECTS.—The thirty-third annual dinner of this society was held on Thursday evening in last week at the

Queen's Hotel, Manchester. The president of the society (Mr. John Ely) occupied the chair, and the company included the President of the Royal Institute of British Architects (Prof. Aitchison, A.R.A.), Mr. John Holden (ex-president of the society), Mr. Edward Salomons, Mr. W. A. Royle, the president of the Liverpool Society of Architects (Mr. Willink), Mr. R. I. Bennett (vice-president of the society), Mr. Alfred Darbyshire, Colonel Eaton, Mr. Paul Ogden, and Mr. E. Hewitt (hon. secretaries); Mr. C. Heathcote, Mr. G. H. Willoughby, Mr. F. Mee, Mr. P. Barker, Mr. J. D. Glass, Mr. J. D. Mould, Mr. A. J. Murgatroyd, Mr. J. D. Harker, Mr. M. Robinson, Mr. W. R. Sharp, and Mr. A. J. Sharp. The President proposed "The Royal Institute of British Architects and its President." Professor Aitchison, in his reply, urged the importance of architecture as a factor in a nation's progress, and pointed out how difficult it was for architecture to advance unless the public took an interest in it. There were special difficulties in the way of the architect, for whereas the products of genius in music and in painting could be exhibited all over the world, the works of the architect could not be so treated. Unless there was some strong love for a thing, or some considerable appreciation of it, he did not see how it was possible to expect persons to devote their whole lives to it, and more especially those who had a natural genius for it. Mr. A. Darbyshire proposed "Our legal friends." His Honour Judge Parry responded in a humorous speech. The remaining toasts were:—"The allied societies," proposed by Mr. Holden, and responded to by Mr. Willink; "The President," proposed by Mr. W. Goldthorpe, and acknowledged by Mr. Ely; and "The honorary secretaries," proposed by Mr. Bennett, and replied to by Mr. Hewitt.

CHIPS.

The Glasgow and South-Western Railway Company intend to enlarge the best of the Glasgow stations. The St. Enoch station has six platforms now, but they are to be increased to twelve. Two streets are to be taken in, and courts and lanes included, whilst tunnels are to be enlarged and bridges widened.

The work of conservation and restoration of the old stained glass in St. Deny's Church, York, has been brought to completion by the reinsertion of the third window of the north aisle, which is of similar style to the other two windows in the aisle. The artist is Mr. J. W. Knowles, of Stonegate, York.

An application will be made to Parliament next session by the Honourable Society of the Inner Temple for an Act to modify and amend section 28 of the Thames Embankment Act, 1862, and to authorise the society to erect and maintain buildings upon so much of the reclaimed land belonging to them as lies between the southern extremity of the buildings proposed to be erected in extension of King's Bench-walk and the northern side of the tunnel of the Metropolitan District Railway.

At a meeting of the directors of the Edinburgh Building Trades' Exchange, held on Friday, the following motion was agreed to:—"It being currently reported in building circles that the estimates for work at the infirmary have not been settled in a satisfactory manner, the directors of the Exchange take up the matter, and instruct their secretary to communicate with the secretary of the infirmary, and ask him, for the satisfaction of the building trades, to forthwith publish a list of the estimates received."

Holy Trinity Church, North-front, Kingsland, Southampton, was reopened last week after undergoing alterations and restoration. A porch has been added near the north-west angle, the font has been removed and placed in a baptistery, while the front of the choir stalls consists of new carved work, the whole of this having been carried out by Mr. J. Potts, of Bargate, Southampton. A new window has been cut in the north side of the baptistery, the stonework having been executed by Messrs. Garrett and Haysom, being a copy of one in Romsey Abbey. It will be filled in with stained glass. Stained glass has been substituted for plain glass in the windows in the chapel, this work having been carried out by Messrs. F. and J. Young, of St. Mary's-road, Southampton. The cost has been £400.

Among the commissions which Messrs. Hems and Sons, of Exeter, are executing for across the seas is a memorial to the Venerable Archdeacon Lough, which is to be erected at Hamilton, on the Island of Bermuda. The monument is of Celtic character, fashioned in grey Dartmoor granite. It is a replica of the one placed over the late Lord Frederick C. Cavendish, at Bolton Abbey, Yorks.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLII., XLIII., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., LI., LII., LIII., LIV., LV., LVI., LVII., LVIII., LIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

M. S. A. (The competition certainly does not seem a very inviting one)

RECEIVED.—A. F. R.—G. T. B.—B. J. and Co.—G. T. S.—P. O. B.—A. T. R.—W. A. W. R.

Correspondence.

SURBITON MUNICIPAL OFFICES COMPETITION.

To the Editor of the BUILDING NEWS.

SIR,—We have read your review of the designs submitted in this competition in your last issue. We shall be much obliged if you will kindly make the following correction in your next number. Our design No. 25 was cubed at 9½d., and No. 11 at 7d. Your report stated the reverse of this.—We are, &c.,

FORSYTH AND MAULE.
16, Great Marlborough-street, W.

WALTHAMSTOW BATHS COMPETITION.

SIR,—Half a story is very misleading, and had you known the whole we scarcely think you would have made the remarks you did in your recent issue.

In December, 1895, the council's surveyor sent us a plan of the site, and we then prepared a plan of the proposed baths, and laid it before the council, when we were requested to attend a sub-committee to settle the details of the scheme.

We therefore considered we were appointed architects to the baths; but ultimately Mr. Dunford, a local architect, was brought on the scene. Under the circumstances we do not think any competition should have taken place. However, we took part in the competition, and we have since been informed that when Mr. Rowland Plumbé's report was received, the council determined to place the work in our hands; but owing to a change made in the personnel of the council,

the new board, which contained a majority of Mr. Dunford's supporters, determined to have his plans adopted, with what result you know. We have not seen Mr. Plumb's report; but we were told that he considered our design the best.

However, when we heard that Mr. Dunford was to be intrusted with the work, we did not move in the matter, either directly or indirectly, and we were much surprised to receive an invitation from the council in June last to meet the works committee to discuss the details of our design. Trusting you will insert this letter,—We are, &c.,

SPALDING AND CROSS.

"FIREPROOF" BUILDINGS.

SIR,—Having been an eye-witness of the late disastrous fire, I should like to draw attention to the absolute unreliability of the so-called fireproof buildings. From my observation, I noticed that in nearly every case the fire commenced at the roof and spread downwards, excepting those buildings which were immediately opposite a burning structure, in which cases the premises caught fire through the window-frames getting alight and shivering the glass.

In the preparation of plans for a small warehouse, I am adopting the following precautions, which I hope will tend to make the building really fireproof:—

1. All stanchions are detached from outer and party-walls, and entirely surrounded by fireproof composition.

2. Where it is impossible to carry the girders on piers of sufficient width, the girders will rest on stanchions, the ends being bedded in the piers, with space for expansion; all girders cased with fireproof plaster.

3. The cement plastering will be on metal lathing kept 2in. away from all outer and party-walls, this space being left from top to bottom of building, a perforated water-sprinkler will be fixed at level of ceiling of top floor, so as to allow of a constant current of water being turned on to outer walls in case of fire.

4. The roof, instead of being constructed of wood, felt, and deal laths, will be formed of light iron framing covered with plaster, in which tiles will be bedded. No dormer windows will be fixed, but where top light is required, metal skylights will be placed, having iron outside shutters. The roof will have a very flat pitch, so as to allow firemen to get all round the building without difficulty or danger.

5. All window openings have double oak sashes, glazed with plate-glass, the outer built in 9in. reveal, the lintel over perforated to allow of water-sprinkler acting on the glass.

6. The concrete stairs incased in brick walls give access to the various floors, with iron doors on each landing.

7. The floors will be constructed of rolled steel joists, 2ft. apart, with Picking's blocks and coke-breeze, covered with solid wood-block flooring.

As the drawings will not be completed until the middle of December, I should be very glad to receive any suggestions which may occur to your readers.—I am, &c.,

J. HATCHARD SMITH, F.R.I.B.A.

41, Moorgate Station Buildings, E.C.

Nov. 25.

SHODDY v. FIREPROOF CONSTRUCTION OF BUILDINGS.

SIR,—Since the recent great fire in Cripple-gate, the papers have been replete with sensational descriptions and censorious correspondence condemning the said inefficiency of our fire-brigades and their alleged obsolete extinguishing appliances, also the erection of high buildings in narrow streets, &c., whilst the unnecessary employment of combustible materials for their interior construction appears to have been ignored. As the wisdom of the adage "Prevention is better than cure" is generally admitted, this oversight seems remarkable. It is an undisputed fact that a vast quantity of inflammable materials is still unnecessarily used in the construction of most (even modern) buildings. Indeed, many seem veritably designed to catch fire and get burned out.

Everywhere around us we see evidence of this deplorable cheap and conservative practice in the dangerous forms of wooden roofing, flooring boards and joists, staircases and landings, stud and lath partitions, matchboard ceilings and linings and divisional compartments, &c. (lead gas-pipes, &c.), when an additional outlay on the structure of not more than 10 per cent. could

insure the employment of fire-resisting materials throughout, which would render the building practically fireproof.

With our present system of "jerry" building it is wonderful that greater loss of valuable lives and properties does not occur than is the case. As there are numerous approved and tested fire-resisting constructions and fittings in the market, it seems high time that legislation should be brought to bear to prohibit the use of unnecessary inflammable materials in buildings.

At length a "Fire-Prevention Committee" has just been inaugurated in our metropolis, with the view, among other laudable aims, of pressing for some such reforms with reference to building construction. Of late the authorities have awakened to the fact that priceless treasures are still stored in some of our museums of the combustible nature at issue, and a select committee has recently reported to Parliament on the subject; but as yet, I believe, no decision as to the amelioration of this risky state of affairs has been arrived at. The dearth of papers which have been read before our learned and technical societies and institutions on the matter is rather remarkable. I understand, however, that one is shortly to be read before the Society of Arts on this subject.

From 1853 until 1891 I am informed not a single paper on the subject in point was presented or read before the Inst. of C.E., and I know of no other since that date. In this respect we seem to be behind many other nations, as also with regard to fireproofing tests and experiments.—I am, &c.,

London, Dec. 1.

J. B. SMITH.

CHIPS.

The extension to the Toxteth Union Infirmary, Liverpool, is being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves with descending smoke-flues, those previously supplied having given every satisfaction.

At the Birmingham Police-court on Friday an application was made on behalf of the town clerk for a certificate for the new meat-market in Bradford-street. Mr. J. C. Nicol (Messrs. Essex, Nicol, and Goodman, architects) gave details of the buildings and the area covered by them. Including the site, the cost of the new meat-market would be £110,839. The market was ready for use, and would be opened at the end of next week. The Bench, after visiting the buildings, have signed the certificate.

At the Chester Consistory Court on Friday, Lord Tollemahe, lay rector and owner of the chancel of the parish church of Acton, was granted a faculty for erecting a new roof over the chancel, a chancel screen, and for effecting other internal structural alterations, the cost of which (£1,200) would be borne by the applicant. A further faculty in respect of the same church was granted to the vicar and the churchwardens to construct a vestry at the west end of the nave, to build an organ in the new organ-chamber, and to carry out other alterations.

The General Purposes Committee of the Huddersfield Corporation elected on Friday a borough surveyor to succeed Mr. R. S. Dugdale, who retires at the end of the year. Seven candidates had been selected from the numerous applicants. The first round of voting was 44 for Mr. Kenneth Campbell, borough surveyor, Stockton-on-Tees; 24 for Mr. M. H. Sykes, borough surveyor, Morley; 19 for Mr. E. Paley Stephenson, surveyor to the Llandudno District Council; 15 for Mr. E. Nicholls, city surveyor's office, Leeds; and 12 for Mr. W. Howard Smith, recently city surveyor, Carlisle. Mr. Campbell was eventually elected. The salary attached to the office is £500 per year.

The Suffragan Bishop of Southampton consecrated on Friday a new cemetery at Bournemouth. The cemetery, which is situated at the eastern side of the borough, occupies between 30 and 40 acres, and including £14,000 for the purchase of the land, has cost over £20,000. Some 25,000 grave spaces are provided.

Some time ago, when the Crown authorities announced their intention of inclosing a further portion of Dean Forest, some opposition was raised because the old Roman road ran through it. The Crown officials have just informed the East Dean Parish Council that it would be impossible to go to the large expense of fencing both sides of the Roman road from Soudley to Howbeach—some three miles. The Crown authorities are prepared to do all they can to preserve this fine old road to the public, and will have gates put at each end, and will not allow any of their timber to be hauled along the road. If the public prefer, they will not plant any timber between the banks, and will clear the road, so that it may induce people from a distance to view it.

Intercommunication.

QUESTIONS.

[11850].—**Raising Water.**—It is required to raise water from a well 100ft. distant by means of a pump fixed in the house. The ground-level at well is 3ft. higher than at house. Level of water is 12ft. below top of well. Will there be any difficulty if pipe is connected direct from well to pump? Can the pipe follow the slope of the ground, or should it be laid with a fall to well?—STUDENT.

[11851].—**Cesspools.**—Can any of your readers tell me of a reliable work on isolated drainage for small country houses, giving more particularly the best methods for constructing cesspools and disposal of the contents? All articles, books, &c., which I have read condemn cesspools altogether, without giving any alternative except costly systems which are out of the question for small houses.—LIMITED.

[11852].—**Slate Roofs.**—Will any practical correspondent of the BUILDING NEWS (and I know there are many) give me any information about the mode of laying slates, where the nail-holes should be made, what gauge is necessary in roofs of square pitch, whether battens or boarding is preferable?—also the number of Countess slates required per square of roofing, how the hips and valleys ought to be covered? Textbooks give very little advice in these details, and treat them as if they were beneath notice.—A NOVICE.

[11853].—**Fireproofing Iron Columns.**—I should be glad to know if any kind of vitrified ware is made for incasing iron columns, and whether there is any particular kind of clay suitable? Is cement plastering any good as a protection, and how should it be applied?—A. S. T.

[11854].—**Zinc Roofing.**—Is it true that zinc does not deteriorate quickly—that its oxidation is not so destructive as that of iron?—L.

[11855].—**The City Fire.**—Being interested in fireproof structure, I should like to know what (if any) protection was used in any of the iron structures which have been destroyed or wrecked; also, whether steel or ordinary iron beams have suffered the most? It is difficult to obtain information; but some of the readers of the "B.N." may be able to give some reliable information on the action of the fire on any of the ironwork. A great many walls, front and back as well as party walls, appear to have fallen, or been since demolished. Probably the iron girders and beams had something to do with this.—WAITING.

[11856].—**Treads for Stairs.**—The experience of any reader as to the wear of any kind of treads and their relative durability will be received with thanks by—G. G.

[11857].—**Concrete Flooring.**—The opinion of practical architects (not patentees) having had experience in the construction of concrete warehouse floors is invited, and will be esteemed, as to following points:—Assuming the main beams to have 20ft. span, and placed 16ft. from centre to centre; dead load, 8cwt. per square foot. 1. At what distance apart should the transverse R.S. joists be placed? 2. Should the concrete be cambered or flat on the underside? 3. What are the relative merits or demerits of concrete flooring in compression and in tension? 4. Should the steel-work be wholly encased in concrete or partly in concrete and terracotta or fireclay? 5. Is it best to make the concrete of Portland cement and stone, or is it preferable to substitute coke-breeze or clinkers for stone where strong substantial work is required? 6. What are the practical advantages of the various paraphernalia now upon the market in the form of differently-shaped cylindrical fireclay and stoneware centring blocks, which seem, owing to the nature of the material, practically to fix the distance apart of the transverse R.S. joists at 2ft.? Is it only in buildings likely to get on fire that they are useful? In mill work flat concrete flooring with light transverse metallic joists 2ft. to 3ft. apart seem to be largely in vogue, and in other cases the joists are placed at 3ft. centres, with the concrete cambered on the under side. 7. What would be a proper thickness of concrete to adopt for P.C. and stone, and P.C. and coke-breeze, concrete respectively, with loads of 2, 3, or 4cwt. per square foot of dead load? The above are questions of great interest to the profession; but, to be of any real value, it is of the utmost moment that the replies must be from practical persons with—NO AXES TO GRIND.

[11858].—**Rough-Cast.**—Will someone give specification of cement rough-casting, which will finish either white or a very light colour? Also for the same, pebbledashed?—W. W.

REPLIES.

[11833].—**Painting of Galvanised Iron.**—I have read "H. C. S.'s" reply to mine, which appeared in your issue of the 19th November, and note the description he gives of the action of the chemicals when applied to the galvanised iron; but, not being a chemist, I am unable to fully appreciate all he states. I notice, however, he admits that there is a destructive action set up when the chemicals come into contact with the zinc. This I have found to be so from practical experience, and as there is but a very thin film of zinc on the iron, I have found that this film becomes completely destroyed.—C. T.

[11846].—**Blisters.**—As the door has been repeatedly painted, I would suggest that the paint be all burned off or scraped off, and then a coat of good, quick-drying hard copal varnish laid over the knots, and where the blisters have shown themselves in the paint. When this varnish is dry to the touch, proceed to paint the door in the usual way.—H. C. S.

[11847].—**Lap to Tile Roofs.**—A reference to any good textbook would show that the "lap" is always measured from the top or head of the tile. During a long experience I have never heard of measuring the "lap" from the nail-holes, nor have I known leakage to proceed from rain finding its way through the nail-holes, these always being covered by a double lap of the tiles.—BUILDING SURVEYOR.

[11847].—**Lap to Tile Roof.**—There is some misunderstanding about this question. The lap of a tile,

like that of a slate, is generally taken to be the distance measured from the head of tile which is nailed to the battens, to the tail of the second one above it—generally 2½ in. to 3 in.; but slaters deduct the part of slate above the nail-holes when they are nailed near the head, about 1 in. According to this rule, the 1 in. is deducted from the length of slate, and is not included in the lap. The method adopted by the slater in finding the position of nail-hole is: gauge + lap + ½ in. = distance of nail-hole from tail; or the lap is added to gauge, which is the distance between nails or battens, allowing ½ in. for clearance. But for middle nailing the nail-hole is disregarded. For effective lap, it should be taken from nail-hole, and this rule applies to tiles for the same reason.—G. H. G.

[11847].—**Lap to Tile Roof.**—In slating, the "lap" is the distance between the nail of the under slate and the lower end of the upper one which overlaps. The same rule applies to tiles, except when the peg-holes are replaced by studs cast with the tile. The object of a lap is to make a waterproof roof, and this can only be effectually done by covering the nail-hole or peg. Of course, this method of measuring from nail-hole is more expensive, as more tiles are required.—GAMMA.

[11848].—**Temporary Structures.**—I am not aware of any textbook treating of this particular kind of structure, except some modern books on carpentry. Nowell's "Carpentry and Joinery," I believe, gives a few examples of wooden buildings. "Surrey" will not find much difficulty in the matter. If he wishes to erect a temporary wooden building, he has only to build the necessary sleeper walls and erect the timber studs and braces with the usual filling-in, lap or clasp-board the outside, and match-board the inside; the roof may be of iron of the ordinary type, king or queen post. The up-rights are framed into a sill piece, which rests on the sleeper wall—say, 9 by 9; also into a head-piece of the same scantling, upon which the principals of roof rest. Examine a few wooden or corrugated iron structures.—A. L.

CHIPS.

Mr. Walter Morrison, M.P., will introduce a Bill in next session of Parliament to amend the law relating to boundary fences.

The extensive sawmills at Old Ford-road of Messrs. Esdaile and Company (Limited) were partially destroyed by fire on Friday. From some undiscovered cause a building 120ft. long by 50ft. wide caught fire, and the flames spread very rapidly.

At Wolverhampton, on Friday, William Ebdon, described as a speculative builder, was ordered to pay in fines and costs £18 4s. for contravening the bylaws by not properly erecting a dwelling-house. The case was proved by Mr. Bradley, the borough surveyor, and supported by Mr. H. Willcock, builder, of that town. It was stated by the town clerk that the defendant had erected a number of buildings in the borough; but in the cases in question the walls were not properly bonded together, and in one instance a new building had become cracked.

An endeavour will shortly be made to raise funds for the enlargement of the Church House, Westminster, by the erection of a west-front block from plans by Sir Arthur W. Blomfield, A.R.A., at a cost of something like £18,000, of which over £5,000 has already been subscribed without any public appeal. The section will commemorate the late Mr. Henry Hoare, who was a prominent figure in the revival of Convocation, and will contain the hall for the use of the House of Laymen, and 19 other rooms available as offices for various societies and agencies connected with the Established Church. In the great hall an organ is being built by Messrs. Lewis and Co., of Brixton.

Experimental filtering operations are being carried on at the Knothrop sewerage works of the Leeds Corporation under the supervision of Mr. W. J. Dibdin. Mr. Dibdin has prepared a report to the effect that the effluent obtained is practically clear of suspended matter. The experiment which is being tried at Knothrop is similar to one which Mr. Dibdin has for some time past been engaged in carrying out at the Northern outfall precipitation works, under the direction of the Main Drainage Committee of the London County Council. A one-acre coke-breeze filter is used.

In order to render wood waterproof and fireproof, the following "silicification" process is made use of, according to the *Gouerbe*. The small boards are first laid in a waterglass solution of 5° to 10° Bé., where they are left ten to twelve hours, when they are taken out and allowed to drip off. After drying, they are placed in a solution (gravity 2° to 3° Bé.) of calcium chloride, magnesium chloride, and ammonium chloride. In this they are left four to six hours, and after dripping off and drying again, they are ready for use.

On behalf of the Manchester Corporation an application was made on Friday to the stipendiary magistrate at the county police-court in that city, for a six months' extension of the order calling upon the corporation to carry out further works for the purification of the sewage of the city. The Mersey and Irwell Joint Committee agreed to an extension. The magistrate expressed the hope that the new Rivers Committee would get seriously to work, and produce a scheme before the 25th March next, to which day he adjourned the matter.

LEGAL INTELLIGENCE.

SEWER OR DRAIN.—VESTRY OF ST. MATTHEW'S, BETHNAL GREEN V. SCHOOL BOARD FOR LONDON.—This appeal, from a judgment of the Court of Appeal affirming a decision of the Queen's Bench Division, was heard by the House of Lords (the Lord Chancellor and Lords Herschell, Davey, Morris, and Shand sitting) on Friday. The London School Board originally applied for a mandamus against the Vestry of St. Matthew's to compel them to repair a certain pipe, which was constructed in 1866 and received the drainage of several houses. It did not appear that the previous approval of the Metropolitan Board of Works, or that any order of the vestry had been obtained for its construction. The question was whether the pipe was a "drain" or a "sewer" within the definition of those words in section 250 of the Metropolitan Management Act, 1855. In the event of it being a sewer it would be repaired by the vestry, but if it was found to be a drain the repair devolved upon the School Board, as the owners of premises. The Court of Appeal affirming the decision of the Divisional Court, held that the pipe was a sewer, and the fact of the requisite consent not having been obtained for its construction did not make it less a sewer, and the vestry were, therefore, bound to repair it. From that judgment the vestry now appealed. The Lord Chancellor, in delivering judgment, said the parties did not seem to have recognised the importance of bringing the whole system of drainage before the House, and of at least submitting a plan of the immediate neighbourhood. It was clear, apart from statutory definitions, that this was what everybody would understand to be a sewer. He had not the smallest doubt that the officers of the vestry perfectly well knew what was being done. It was not a small operation; the highway must have been taken up, and the local authorities must have been fully aware of the purpose and effect of the work. If, then, this was a sewer, it was impossible to avoid the application of the language of the Act of Parliament, or the conclusion that the sewer was vested in the vestry, and must be repaired by them. A combined system of drains might be constructed under an order of the vestry by a private person. In such a case, the combination would still be a drain and not a sewer; but there was no evidence of such a state of things. It was clear that those who alleged that this was a drain and not a sewer must prove that such an order of the vestry was made; but no such order was produced, and he did not believe that any order of the kind was made. He came to the conclusion that the judgment of the Court of Appeal was right and must be affirmed. The other Lords concurred, and the appeal was dismissed with costs.

CLAIM AGAINST THE LONDON SCHOOL BOARD.—Mr. Undersheriff Burchell and a special jury, at Red Lion Square, Holborn, on Wednesday heard the case of *Hurle v. the School Board for London*—a claim for £1,750 for freehold houses and land at Homerton, taken under a notice to treat, served as long ago as 1895. Mr. F. Meakin, Mr. A. R. Stenning, and Mr. E. F. B. Fuller were the valuers for the claimant; Mr. Samuel Walker and Mr. G. A. Wilkinson were the experts for the Board, on behalf of which evidence was tendered that the property was worth about £1,100. The sealed offer of the Board was £1,200. The jury awarded £1,280.

REPAIRS TO COTTAGE.—OSBORNE V. PECK.—The plaintiff in this case, heard by Mr. Justice Ridley, on Friday, was a builder, and the defendant a well-known trainer of racehorses, who rented for training purposes a large part of the Howbury Hall Estate, at Renhold, in Bedfordshire. It was said in the course of the case that the defendant paid about £800 a year for rent, and that he had spent £7,000 or £8,000 upon the property. The plaintiff sued to recover £96 6s. 2d. for repairs done to a cottage on the estate called Ladyfield, and in which a Mr. Wright, who was then secretary and farm bailiff to the defendant, lived. It appeared that Mr. Wright gave orders for the repairs to be done; and one question raised was, whether he had any authority to give orders for the repairs so as to bind the defendant to pay for them. Another point in dispute was whether the repairs were to be done at the expense of the defendant or at the expense of the mortgagees of the estate. Mr. Justice Ridley said that the dispute had arisen in consequence of the parties having misunderstood each other. He had come to the conclusion that the defendant must pay for the repairs which had been done. Judgment for the plaintiff for the amount claimed.

PERSONAL INSPECTION REQUIRED OF DISTRICT SURVEYORS.—Messrs. Patrick and Son, builders, of Westminster Bridge-road, were again summoned, on Tuesday, at Southwark Police-court, by Mr. Bernard Dicksee, district surveyor, for the non-payment of £23 12s. 6d., his fees for inspecting a number of stands erected by the defendants within the premises of Messrs. Day and Martin, Ltd., Borough-road. At previous hearings evidence was given that the stands were inspected on the complainant's behalf by a young man named Brown, who was not a qualified surveyor, and it was contended that Mr.

Dicksee ought to have personally inspected them. The magistrate, in giving judgment, said the work of surveying and inspecting was obviously work of a personal character, involving the exercise of professional skill, judgment, and experience; and in his opinion such work could only be performed by the district surveyor himself, an assistant surveyor, or by his deputy duly appointed under section 142. Therefore he non-suited the complainant, but would grant a case, if desired.

LONDON BUILDING ACT CASE.—LONDON COUNTY COUNCIL V. FOULKES.—At North London Police Court, on Friday, Mr. D'Eyncourt had before him this case, which related to proceedings under the London Building Act of 1894. The defendant, Mr. C. H. Foulkes, builder, of Clevedon-road, Hornsey, has been engaged since 1893 in developing an estate of eight acres known as The Willows, Clissold Park, Stoke Newington. The estate has a crescent-shaped frontage to Park-lane, a quarter of a mile long, and has been built over with a serpentine road, the ends of which are at the western and eastern ends of the crescent. Three closely-packed lines of houses had been placed on the property, and in the serpentine thoroughfare—Carysfort-road—spaces had been left for the formation of a small inner crescent. All this was done before the Act of 1894 came into operation. In November, 1895, the defendant began to build on the smaller crescent, but the County Council refused to give its assent. The case ultimately came before this Court, when the defendant contended that, as he had commenced to lay out the land before the passing of the Act, he did not need the consent of the council to proceed with the work, as required by the Act of 1894. Mr. D'Eyncourt found in favour of the defendant; but the County Council took the case to the High Court, and the judges (Mr. Justice Wright and Mr. Justice Kennedy) there reversed the decision. The matter now came up for Mr. D'Eyncourt to impose penalties; but Mr. Salter, who appeared for defendant, wished to reopen the case on the ground that the judges had only decided one of the three points which the magistrate submitted for their decision. Mr. T. A. D. Chilvers, for the London County Council, said that the whole matter was argued in the High Court, and the judges dealt with all the points in their judgment, although in their order it was only mentioned that they found that the work was wrongfully commenced or recommended after the Act of 1894 came into operation. Mr. D'Eyncourt said his view of the order of the High Court was that it declared him to be wrong, and directed him to reverse his decision altogether. He should, therefore, impose a penalty of £3, with £2 2s. costs.

The Rhymney Railway Company, having purchased 17 acres of land at Wunddu (between Caerphilly and the tunnel on the southern side of the town) for the purpose of erecting engineering and running sheds, has commenced levelling the ground and erecting boundary-walls. The Rhymney Company intends to leave the erection of houses to private enterprise.

A Metropolitan deep-tunnel scheme to be brought forward next session as a branch of the City and South London Railway, starting from High-street, Borough, near the London and County Bank, and terminating in Brixton Hill, 88 yards from the milestone denoting four miles to the Royal Exchange. At the same time the approach to the King William-street Station is to be widened from the spot where the South-Eastern Railway Company's bridge crosses High-street, Borough.

Mr. Herbert H. Law, one of the Local Government Board inspectors, held an inquiry at the Audit House, Southampton, on Wednesday in last week, with reference to the proposal of the Southampton County Council to borrow the sum of £14,500 for the erection of a municipal lodging-house. The borough engineer, Mr. W. B. G. Bennett, explained the plans in detail. The lodging-house will accommodate 225 men, and will be heated by hot water, and lit by electricity. The house will be practically fireproof. Under the Provisional Order the corporation are bound to clear the site, and erect upon it dwellings for the accommodation of not less than 250, before they are allowed to demolish the other dwellings in the condemned area.

A stone reredos has just been erected in St. Asaph's Church, Birmingham. It is designed in the Decorated style, and consists of a large centre panel over the altar table, filled by a representation of the "Last Supper." Above this is a recessed canopy, supported by green marble columns at either end, the face of which is divided by buttresses into seven panels of pierced tracery work with carved spandrels. The centre of the canopy rises into a crocketed gable, flanked by pinnacles. At the sides of the reredos are panels of the vine and wheat. The side panels are carried above the centre portion, and terminate in light open spirelets. A carved cresting runs along the top of the canopy. The work has been executed by Messrs. Jones and Willis, of Birmingham and London.

Our Office Table.

THE London Technical Education Board, in their report published this week, remark that the most significant fact in connection with the nine polytechnics which fall under the Board's sphere of operations is that, notwithstanding the opening of four new large polytechnics during the four years that the Board has been at work, no diminution has been caused in the number of students attending the older institutions; but, on the contrary, every one of the nine institutions shows an increase in the number of class entries for the present session. Thus the remarkable result has been brought about that, although these four new institutions show this session a total of over 8,000 class entries, representing a total number of nearly 5,000 individual students, yet the enrolment of these new students has not only not decreased the membership of the other older institutions, but has actually stimulated their growth. There are now in attendance at the evening classes of the nine polytechnics about 18,000 individual students, the great majority of whom are engaged in systematic courses of evening instruction under the direction of the principal of the institution where they are studying. The classes in the building trades show in almost every case an increase in the number of students. The classes in these subjects at the Borough Polytechnic have made a particularly marked advance, the number of entries in the carpentry and joinery classes being 102 as compared with 54 at the commencement of last session, while the classes in technical drawing and workshop drawing have increased by over 50 per cent. In the engineering trades there is likewise a very general increase in the attendance at the classes.

THE exhibition of French art at the Guildhall Art Gallery in the coming year promises to be an unusually attractive one. It will differ materially from the loan exhibitions which have been held at the Guildhall in the past. The last exhibition was attended by 248,093 persons, the attendances on weekdays numbering 231,705, or a daily average of 2,385; while the Sunday attendance was 16,388, or an average of 1,170 each Sunday. There were sold 30,011 copies of the descriptive catalogue, which was prepared by Mr. A. G. Temple, F.S.A., the director of the Guildhall Gallery, the profit from the sale of these catalogues enabling the Library Committee to draw upon only £287 17s. 4d. of the £450 which the Court of Common Council granted for the purposes of the exhibition.

THE Spring Exhibition, which is to be revived in Liverpool next year, will, in addition to many other exhibits, include a section devoted to objects illustrating the work of the various technical schools. The classes which are likely to be represented are the house-painters and decorators, bookbinders, plumbers, designs by the School of Art, and woodcarving and wrought ironwork by the architectural and applied art students. The exhibits, which should form an interesting collection, will probably occupy a special department. The exhibition promises to be an attractive and successful one.

IN the Corporation Galleries, Glasgow, on Tuesday night, Mr. Paton delivered the fifth of his addresses on Italian art, his subject being "Michael Angelo." He referred to the characteristics which distinguished the truly great artist, the true test of whom was that his works deal not with things fleeting, ephemeral, local, trivial; but with what affects men in all climes, in all times, and under all conditions. Frith's crinolined woman was like a fashion plate of 1870; Raphael's "Madonna" was the eternal feminine. The two great sculptors of the world were Phidias the Pagan and Michael Angelo the Christian. The works of Phidias were serenely beautiful, bright, passionless, calm, fit types of the gods of a people where deity and humanity touched each other at so many points. The gods of the Greeks were the incarnations of specific powers, virtues, and attributes, and could be fittingly treated in the calm, dignified, and passionless fashion which belongs to sculpture. Michael Angelo had another task as the typical Christian sculptor. He had to express through his obdurate material, and with the limitations of sculpture, something of the spirit of modern man, to deal with things pertaining to the unseen and the eternal. Hence his figures are full of action,

emotion, of the suppressed excitement and volcanic thoughts which possessed the man. Michael Angelo was a great solitary Titanic soul full of concentrated thought and impassioned imagination, pure in life, steadfast in faith, loathing and lamenting the conditions of life and society around him—the prophet or seer of the Renaissance.

THE ninth annual Congress of Archaeological Societies in union with the Society of Antiquaries was held at Burlington House on Wednesday. Viscount Dillon presided, and many delegates of societies attended. Resolutions were adopted for forming a catalogue of effigies of all dates in parish churches, and for compiling models for catalogues for museums and for indices of transactions of societies. It was announced that preparations were now made for obtaining, through the various societies, catalogues of family and historical portraits on the forms devised at the request of the congress by Mr. Lionel Cust, the director of the National Portrait Gallery. The formation of a National Photographic Association was also announced; this will, it is hoped, assist the work inaugurated by the congress some years back.

MR. TREVAIL, F.R.I.B.A., of Truro, chairman of the Headland Hotel Company, met at Cardiff, on Tuesday, several shareholders who, in consequence of the disturbances at Newquay, and representations that had reached them from an interested source, had requisitioned for a general meeting. Mr. Trevail laid the whole subject before them in the most candid manner, together with plans, documents, and leases bearing upon the issue, and described what the mob did, the amount of damage done to the company's property, the prosecutions ordered by the hotel directors, and the 21 convictions which followed. Mr. Trevail also explained Mr. Treffry's position in respect to the question of his title to the land leased to the hotel company and his determination to uphold it, with the result that the shareholders present considered Mr. Trevail's statement most satisfactory, approved of the steps taken by the directors, and agreed to cancel their request for a general meeting, which, in view of the present position of the question, they quite saw would be undesirable.

IN connection with its exhibition in 1898 the American National Sculpture Society proposes to form and display a comprehensive collection of photographs and other illustrations of sculpture and sculptured monuments in America. The scope of this collection will include commemorative monuments, memorials, statues, groups, reliefs, busts, original work in museums, and architectural monuments adorned with sculpture. The society earnestly solicits the active co-operation of individuals and organisations in making this collection, the first of its kind to be proposed in America, as complete and as interesting as possible. It is requested that communications be addressed to the secretary of the National Sculpture Society, Mr. Barr Ferree, 112, Wall-street, New York.

THE New York Rapid Transit Commission has definitely decided in favour of underground railways for transporting passengers through the crowded parts of that city, and it is probable that work upon such roads will be begun within a few weeks. A plan has been drawn up by the commission, which must first be submitted to the Courts, and if approved by them, will be offered for public competition. A company has been formed, which will tender for the work, and, if its bid is accepted, will proceed at once to build the road, operating in several places at once, so that the different sections may be united, and the line put in use as soon as possible. The successful completion and operation of a large part of the underground railway at Boston, Mass., shows how freely subterranean tracks can be utilised by electrical traction, and the position in New York is much simpler than it was in Boston.

A new organ, built by Messrs. Hele and Co., of Plymouth, has been placed in St. John's Church, Walworth.

At a meeting, on Friday, of the committee of the Manchester City Art Gallery, Col. Bridgford, C.B., formally presented to the city, on behalf of Mr. Gibbon Bayley Worthington, of Ossington, Newark, the fine landscape "Winter Fuel" by the late Sir J. E. Millais. Sir John E. Millais hitherto has been represented in the gallery by "Autumn Leaves," a portrait of the late Bishop of Manchester, "Victory, O Lord," and "A Flood."

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (To-morrow).—Examination in Sanitary Building and Construction. Carpenters' Hall, London Wall, E.C. 12 noon.

MONDAY.—Society of Engineers. "Water Pollution and Its Correction," by Reginald E. Middleton, M.Inst.C.E. 7.30 p.m.
Surveyors' Institution. "Royal Commissioners' Suggested Amendments to the Agricultural Holdings Act, 1893," by F. Punchard, F.S.I. 8 p.m.
Society of Arts. "Guttapercha." Cantor Lecture No. 2, by Dr. Eugene F. A. Obach. 8 p.m.
Liverpool Architectural Society. "Domestic Architecture of the Early Renaissance," by J. A. Gutch, F.S.A.

TUESDAY.—Institution of Civil Engineers. Discussion on "The Law of Condensation of Steam." 8 p.m.

WEDNESDAY.—Society of Arts. "The Stockholm Exhibition of 1897," by Bennett H. Brough. 8 p.m.

FRIDAY.—Architectural Association Lyric Club Concert at the Swallow-street Club, Piccadilly.

CHIPS.

A new organ built by Messrs. Norman and Beard, of Norwich, was dedicated in the parish church of Ufford, near Woodbridge, last week.

Under the auspices of the Sheffield Society of Architects and Surveyors, a course of ten lectures on "Some of the Classic Elements of Architecture" is being given by Mr. Hugh Stannus, F.R.I.B.A., in the library of the Montgomery Hall, Surrey-street, Sheffield, on Wednesday evenings. The course began on Nov. 24, and will deal with Mouldings, the Wall, and the Order. The attendances at the first two lectures have been very good.

The London County Council, at their meeting on Tuesday, agreed, after discussion, to expend £60,000 on the construction of a new pumping station at Lot's-road, Chelsea, for dealing with the flow of the low-level and Counter's Creek sewers and relieving them in times of heavy rains. A report from the Parks Committee, recommending that no alteration be made in the present mode of dealing with small open spaces in London, was rejected in favour of an amendment instructing the committee to prepare a scheme whereby all the open spaces now maintained at the expense of the local authorities should in future be maintained by the Council.

Between thirty and forty Romano-British pewter vessels have been found at Appleshaw, near Andover, by the vicar while digging a trial trench on the supposed site of a Roman villa. The deposit consists of large circular dishes, bowls of various forms and sizes, cups, jugs, and platters.

The Light Railway Commissioners have submitted to the Board of Trade an order authorising the construction of a line from the Pewsey Station of the Great Western Railway to Salisbury, over the famous plain, and through the military camp which the War Office authorities intend forming there. The various public bodies in the district to be traversed by the projected railway have received official intimation that the Commissioners have decided in favour of the scheme, which is approved by the Great Western Railway Company.

A Congregational school-chapel erected at Keighley, at the junction of Oakworth-road and Fell-lane, was opened on Tuesday. Mr. John Haggas designed the structure, which includes under its roof an assembly-room 52ft. by 50ft., three classrooms, and a kitchen, the cost of erection having been £1,200.

Although there was a slight lull in the building boom at Blackpool a month or two ago, the Lancashire watering-place is again going ahead, and on Tuesday 80 plans were presented. The surveyor's annual report was also presented, showing the number of new houses certified for habitation as 984 for the year, an increase of 240 on last year, or at the rate of 3.15 per week. The list includes 216 shops, two chapels, two schools, two political clubs, and one circus.

St. George's Church, New Mills, Derbyshire, has been undergoing considerable improvement. This church was built about 66 years ago, and the interior had not, until now, been much altered. The improvements were carried out from plans by Messrs. Preston and Vaughan, of Manchester. A portion of the church has been taken for the formation of a chancel, and fitted with choir-stalls of Dantzic oak and marble pavement. The nave is re-seated, and the organ has been repaired and enlarged by Messrs. Young, of Manchester. The church was reopened on Sunday by the Bishop of Southwell. About £2,000 has been spent.

As the result of a suggestion made by the mayor, the proposal to erect a memorial to the late Duchess of Teck is being seriously entertained in Richmond, Surrey. The idea of placing a statue, with a fountain at the base, in the Terrace Gardens has been received with much favour.

LIST OF COMPETITIONS OPEN.

Cardiff—Town Hall and Law Courts (A. Waterhouse, R.A., Assessor—£200,000 limit)	£500 (merged), £300, £200	J. L. Wheatley, Town Clerk, Town Hall, Cardiff	Dec. 4
City Corporation—Bronze Diamond Jubilee Medal	£20, £15, £10	Sir J. B. Monckton, Town Clerk, Guildhall, E.C.	" 6
Hackney—Electric Lighting Scheme		Geo. Grocott, Vestry Clerk, Town Hall, Hackney	" 14
Westminster—Block of Dwellings, Millbank Prison Site	London County Council	T. Bell, Clerk, Spring-gardens, S.W.	" 14
Nottingham—Laying-out and Planting Basford New Cemetery	£100, £50	Samuel G. Johnson, Town Clerk, Nottingham	" 15
Dorking—Workhouse Infirmary (£4,000 limit)	(No first) £15, £5	Geo. Seales, Clerk to Guardians, 35, High-street, Dorking	" 15
Nottingham—Designs for Basford Cemetery Buildings: Chapels, Crematorium, Lodges, &c.	£100, £50		
Menai Bridge—Landing Pier (£3,000 limit)	£40	Samuel G. Johnson, Town Clerk, Nottingham	" 15
Festiniog—Temporary Eisteddfod Pavilion for 10,000 (£900 limit)		Thos. Hughes, Clerk, Min-y-Den, Menai Bridge	" 16
Bootle—Fire Brigade and Police Stations (£14,000 and £1,500 limits)	10 Guineas	Wm. Jones, Hon. Sec., Pavilion Committee, Blaenau, Festiniog	" 17
Altrincham—U.D.C. Offices	50 Guineas, 25 Guineas	J. H. Farmer, Town Clerk, Bootle, Lanes	" 31
Crith—Water-Supply Scheme (3,100 population)	£20, £10	J. Stokes, Clerk, 64, Market-street, Altrincham	" 31
Carlton, Victoria—Children's Hospital	15 Guineas, 5 Guineas	Joseph Pym, Clerk, Belper	Jan. 8
Leicester—Motor Refuse Carts	£100, £50, £25	J. Nicholson, Hon. Sec., Pelham-street, Carlton, Australia	" 30
Port Elizabeth—Free Library (Assessors, Sir F. Blaine and R. H. Hammersley-Heenan—£20,000 limit)	Corporation	E. G. Mawbey, Borough Engineer, Leicester	" 31
New York—Sun Dial (Plaster Model)	100 Guineas, 50 Guineas	G. Cottle, Librarian, Port Elizabeth, S.A.	Feb. 15
Newcastle-on-Tyne—New Infirmary (local Architects)	500dol., 250dol.	Sec. National Sculpture Soc., 215, West 57th-street, New York	" 28
Belper—Sewage Disposal Schemes	(No first) £150, £100, £50	Secretary Building Committee, Newcastle	Mar. 1
Wadebridge—Schoolroom, adjoining Wesleyan Church	50 Guineas, 25 Guineas	Joseph Pym, Clerk, Belper	May 1
Lymington—New Forest Hall (Limited to Hampshire Architects)	(No first) £5	Walter O. Wellington, Sec., Building Com., Wadebridge, Cornwall	" 1
	25 Guineas	Clerk to Hall, Committee, Lymington	—

LIST OF TENDERS OPEN.

BUILDINGS.

Hampton-on-Thames—Semi-Detached Villas	J. J. Draper	F. G. Hughes, Architect, Hampton-on-Thames	Dec. 4
Coupar Angus—Farmhouse, West Haugh		J. Reid, Architect, Coupar Angus, N.B.	" 4
Barrow—Stores, Hindpool-road	Spencer and Sons	J. Butler, Architect, Cornwallis-street, Barrow-in-Furness	" 4
Leicester—Additional Goods Warehouse	Midland Railway Company	The Company's Architect, Cavendish House, Derby	" 4
Lossiemoth—Villa at Stotfield		R. B. Pratt, A.R.I.B.A., County Bank House, Elgin	" 4
Londonderry—Stables		W. R. Gill, Secretary, York Road Station, Belfast	" 4
Buckie—Writing Chambers, Baron-street	Belfast & Northern Counties Ry. Co.	Jas. Perry, Architect, 44, East Church-street, Buckie	" 4
Frizington—Six Houses	A. B. Hendry	James Gracie, 12, Rheda-terrace, Cleator Moor	" 4
Dundee—Bathroom, &c., at West Poorhouse	Combination Parish Council	William Alexander, City Architect, Dundee	" 4
Inchmyre—School and Teacher's Residence	Banchory-Devenick School Board	R. G. Wilson, Architect, 181A, Union-street, Aberdeen	" 4
Aberystwith—Chancel and Vestry, Trinity Church		Rev. Prebendary Williams, Aberystwith	" 4
Brymbo—Alterations to Bwlchgwyn School	Brymbo School Board	Davies and Moss, 11, Regent-street, Wrexham	" 4
Monsall—Covering Roofs of Temporary Hospital Buildings	Manchester Sanitary Committee	The City Surveyor, Town Hall, Manchester	" 4
Ballymena—Store	Belfast & Northern Counties Ry. Co.	W. R. Gill, Secretary, York-road Station, Belfast	" 4
Newtownmore—House	Donald Macdonald	Alex. Mackenzie, Architect, Kingussie	" 4
Reddish—Goods Warehouse and Extension of Platforms at Station	Sheffield and Midland Railway Cos.	Oliver S. Holt, Secretary, London-road Station, Manchester	" 6
Silloth—Six Houses	Ind. Coope, and Co.	J. M. Thompson, 13, Esk-street, Silloth	" 6
Leeds—Alterations to Cricketers' Arms, Dewsbury-road		Wm. N. Wynn, 10, Livingstone-street, Roundhay-road, Leeds	" 6
Great Barugh—Wesleyan Chapel and School	School Board	Edward Taylor, Architect, 7, Stonegate, York	" 6
Rowley Regis—Addition to School		J. T. Meredith, Architect, Kidderminster	" 6
Shibden—Semi-Detached House	J. C. Miller	Jackson and Fox, Architects, 22, George-street, Halifax	" 6
Morecambe—One House and Three Shops, Margaret-street	Board of Guardians	Jas. Marshall, Architect, Back-crescent, Morecambe	" 6
Mithian—Taking Down Tower and Spire of St. Peter's Church	Urban District Council	Wm. Swift, Architect, 23, Lemon-street, Truro	" 6
Middlesbrough—Imbecile Wards & Sanitary Blocks to Infirmary	School Board	R. Lofthouse and Sons, Architects, 62, Albert-road, Middlesbrough	" 6
Shibden—Semi-detached House in Kell-lane		Jackson and Fox, Architects, 22, George-street, Halifax	" 6
Llandudno—Municipal Buildings	Urban District Council	Alfred Conolly, Clerk, Council Offices, Llandudno	" 6
Prestatyn—Royal Victoria Hotel		R. E. Hughes, Architect, Stafford Buildings, Prestatyn	" 6
Rodborough—Board School		W. H. C. Fisher, Architect, 6, Rowcroft, Stroud	" 6
Barnsley—Eight Cottages, St. George's-road	John Smith	Owner, 9, Park-grove, Barnsley	" 6
Bridlington—Dwelling-house, Carlton-street	Urban District Council	Samuel Dyer, Quay-road, Bridlington Quay	" 7
Woking—Public Offices near Station	Corporation	G. J. Woodbridge, Surveyor, Bank Chambers, Woking	" 7
Campbeltown—Temporary Hospital at Poorhouse	General Prisons Board for Ireland	James Fullarton, Master of Works, Campbeltown	" 7
Belfast—Hospital within Prison	Guardians	S. H. Douglas, Secretary, Dublin Castle	" 7
Newton Abbot—Additions to Workhouse	Urban District Council	S. Segar, F.I.A.S., Architect, Union-street, Newton Abbot	" 7
Branksome—Bathroom at Isolation Hospital, Ringwood-road		S. J. Newman, Surveyor, 3, Tennyson Buildings, Ashley-road	" 7
Winchmore Hill, N.—Nurses' Home and Isolation Pavilion at Northern Hospital	Metropolitan Asylums Board	T. Duncombe Mann, Clerk, Norfolk-street, Strand, W.C.	" 8
Bingham—Boardroom at Workhouse	Board of Guardians	A. R. Calvert, Architect, Nottingham	" 8

Ceta Coed—Library and Dwelling-House		Jolly and Buckley, Architects, High-street, Chorley	" 16
Bradford—Herring-Curing Establishment, Buck-street		R. C. Jenkins, Surveyor, Ceta Coed	" 17
Buenos Ayres—Central Railway Station (cost, 4,000,000 piastres)		Hodgson and Farrar, Old Bank Chambers, Bradford	" 17
Copenhagen—Repairing Cemented Walls of Thorvaldsen's Museum		Legation of Argentine Republic, London	" 26
Lincolnshire—Stanhope Memorial, Horncastle	Corporation	F. Meldahl, Copenhagen	Jan. 1
Saltaire—Semi-Detached Villas		S. Goe Overton, Secretary, 2, Manor House-street, Horncastle	—
		Peterson and Lawson, Architects, 1, Bank-street, Bradford	—

BUILDINGS—continued.

Bodmin—Isolation Hospital at County Asylum.....	Visiting Committee.....	Robt. P. Edyvean, Clerk, Bodmin
Scarborough—Fourteen Large Houses on South Cliff	A. Moore, 23, West-bank, Scarborough	S. Hills, Architect, Redruth
Redruth—Alterations to Lanner Board Schools	Board of Guardians	A. R. Calvert, Architect, Nottingham
Bingham—Board Room and Offices		
Belfast—Six Houses, Mersey-street, and Six in Lawnbrook-avenue		
Bury—Two Houses and Shops, Elton-road		
Keighley—Houses, Skipton-road	Robert Feather	
Yatton—Additions to Claverham House	Oliver Barber	
Mallaig—Business Premises		
Harrogate—Additions to George Hotel		
Fleetwood—Shop and Dwelling-House		
Dudley—Additions to Conservative Clubhouse		
Colmoneil, Ayrshire—Free Church		
Castleford—Victoria Hotel	W. Pickerskill	
Consett—Fifteen Houses		
Blackheath—Reinstating Two Houses after Fire		
Blackpool—Four Detached Houses, Lytham-road		
Whitehead—Three Terrace Houses	Whitehead Development Co.	
Astley—House		
Ulverston—Re-erecting part of Furness Paper Mills (burnt down)		
Hadleigh—Two Villas	Rugby Citadel Co.	
Rugby—Cathedral Buildings, Castle-street		
Great Horkesley—Additions to The Cedars		
Attercliffe—Sixty Houses		
Feltwell Fen—Cottage at Anchor Drove		
Fota—New Room and Other Work	Rt. Hon. A. H. Smith-Barry, M.P.	
Bradford—Offices and Storehouses, Duke-street		
South London—Ten or Twenty Eight-roomed Houses		
Wigan—Rebuilding Clarence Hotel		
Harrogate—Rebuilding Crown Villa, West Park		
Kirkstall—Three Pairs Semi-Detached Villas, Victoria Park Estate	G. Goodrick	
Holbeck—Rebuilding of the Old Queen Anne Inn		
Harrogate—Semi-Detached Villas in Park Drive		
Wetherby—Tall Brick Chimney	Wharfedale Brewery Co.	
Middleton-St. George—Private Asylum		
Winchester—Six Cottages		
Morecambe—Four Dwelling-Houses, Balmoral-road		
Great Horkesley—Addition to The Cedars	W. Page	
Skegness—Primitive Methodist Chapel (450 sittings) and School		
		John Jackson, M.S.A., Barry-street, Bradford
		A. D. Kaye, Architect and Surveyor, 71, Albion-street, Leeds
		J. F. Royce, 9, Station-square, Harrogate
		T. A. Battery, Architect, Queen-street, Morley
		John W. Dyson, Architect, 67, Grey-street, Newcastle
		J. A. Sawyer, Surveyor, 62, High-street, Winchester
		Harry Eastwood, 19, Regent-road, Morecambe
		Chas. E. Butcher, Architect, 3, Queen-street, Colchester
		Hy. Harper, Architect, Market-place, Nottingham

ENGINEERING.

Sheffield—300 Retort Mouthpieces	United Gaslight Company	Hanbury Thomas, Secretary, Commercial-street, Sheffield	Dec. 4
Penybont—Water Supply	Rural District Council	R. Harnar Cox, Clerk, Union Offices, Bridgend	" 4
Sheffield—Fittings for 150 Through Retorts	United Gaslight Company	Hanbury Thomas, Secretary, Commercial-street, Sheffield	" 4
Southampton—Pontoon, &c.	Harbour Board	E. Cooper Poole, A.M.I.C.E., Surveyor, 4, Portland-st., Southampton	" 6

Davyhulme—Screening Chamber at Sewage Outfall Works	Rivers Committee	The City Surveyor, Town Hall, Manchester	" 10
Northallerton—Iron Bridge across Wiske	Rural District Council	Wm. Fowler, Clerk, Northallerton	" 11
Bathgate—Embankment at Sunnyside Dam	Police Commissioners	J. and A. Leslie and Reid, C.E.'s, 724, George-street, Edinburgh	" 11
Loch Katrine—Waterworks	Glasgow Corporation	J. D. Marwick, Town Clerk, City Chambers, Glasgow	" 11
Castlebar—Water Supply Works	Governors Castlebar Lunatic Asylum	Mr. Thomas Griffiths, Clerk of Asylum, Castlebar	" 13
Barking—Engineering Works at Baths	Urban District Council	C. J. Dawson, F.R.I.B.A., Public Offices, East-street, Barking	" 14
Portsmouth—Repairing Wharf and Quay Wall	Corporation	A. Hellard, Town Clerk, Portsmouth	" 14
Ostend—Harbour Works (estimated cost, £497,792)	Official	Provincial Government, Bruges	" 14
Edinburgh—Extension Railways, Bonnington-road	Caledonian Railway Co.	J. Blackburn, Secretary, 302, Buchanan-street, Glasgow	" 14
Corbach—Water Supply	Lochaber District Council	N. B. Mackenzie, Clerk, Fort William	" 15
Barrow-in-Furness—Boilers and Electric Plant	Corporation	C. F. Preston, Town Clerk, Barrow-in-Furness	" 15
Newport—Electric Lighting Plant at Wentwood Waterworks	Corporation	Albert A. Newman, Town Clerk, Town Hall, Newport, Mon.	" 15
Kirkcaldy—Heating of Memorial Halls	Gas Company	Dunn and Findlay, Architects, 35, Frederick-street, Edinburgh	" 18
Canterbury—Electric Lighting Plant		H. Fielding, Town Clerk, 15, Bursgate-street, Canterbury	" 20
Carriekfergus—Rebuilding Retort Bench		David Gillespie, Secretary, Carriekfergus	" 27
Braila—Bridge and Road (about £7,507)	Vestry of St. Pancras	The Prefect, Braila, Roumania	" 27
London—Arc Lighting Extension		C. H. F. Barrett, Vestry Clerk, Pancras-road, London, N.W.	" 28
Catauzaro—Electric Tramway from Town to Station	Council	The Municipal Authority, Catauzaro, Italy	" 30
St. Gilles-lez-Bruxelles—Gasworks	Government	The Secretary, 504, Chaussée de Mons, Anderlecht, Brussels	" 31
Brazil—Railway from Novo Hamburgo to Caxias	Visitors of N. Wales Counties Asylum	Central Directorate, Public Works, Porte Alegre	" 31
Denbigh—Laying 13,200 yards of Cast-Iron Water-Mains	Government	Wm. Barker, Clerk to the Visiting Committee, Denbigh	" 31
Athens—Docks Extensions (about £110,000)		Chancelloneil, Monarchie Attique, Athens	Jan. 9
Pernambuco—Port Works		Brazilian Ministry of Public Works, Rio de Janeiro	Feb. 28
Madras—Utilisation of Water of Periyar Lake		Chief Engineer for Irrigation, Madras	July 1
Tralee—Three-ton Steam Crane	Burnley Rural District Council	Harbour Commissioners, Tralee	
Altham—Septic Tank		S. Edmondson, Surveyor, 18, Nicholas-street, Burnley	
Ymiden, Holland—Metal Sluice Gates (estimated cost, £19,600)		Provincial Authorities, Harlem	

FENCING AND WALLS.

Grimesthorpe—Concrete Retaining Wall	Sheffield United Gas Light Co.	Hanbury Thomas, Secretary, Commercial-street, Sheffield	Dec. 4
Shoreditch—Unclimbable Iron Railings (5,050ft.)	Vestry	H. Mansfield Robinson, Clerk, Town Hall, Old-street, E.C.	" 7
Shire—Iron Fencing to Schools	School Board	H. W. Dibben, Clerk, Upper Parkstone, Dorset	" 13
Hunslet—Wall in Pepper-road		W. Broughton, Builder, Jesmond-terrace, Pudsey	
Lazonby—Wall near Post-Office		E. James, Silloth	

FURNITURE AND FITTINGS.

Queensbury—Fox Hill Schools	School Board	Drake and Son, Architects, Queensbury	Dec. 4
Leeds—Free Library, Municipal Buildings	Corporation	The Town Clerk, Town Hall, Leeds	" 8
Liverpool—Extension of Nurses' Home at Workhouse	Select Vestry	H. J. Hagger, Vestry Clerk, Parish Offices, Brownlow Hill, Liverpool	

PAINTING.

Belfast—Goods Stores	Great Northern (Ireland) Ry. Co.	T. Morrison, Secretary, Amiens-street Terminus, Dublin	Dec. 6
Nottingham—Eight Board Schools	School Board	W. J. Abel, Clerk, Victoria-street, Nottingham	

PLUMBING AND GLAZING.

Penzance—Washhouse Repairs, &c.	Board of Guardians	Hy. Maddern, Architect, Penzance	Dec. 7

ROADS AND STREETS.

Dewsbury—Paving and Flagging of Wheelwright-street, Halley-street, and Hemingway-street	Corporation	Trevelyan Lee, Town Clerk, Town Hall, Dewsbury	Dec. 4
Birstall—Sewering and Kerbing of School-street, Union-street, and John-street	Urban District Council	William Middlebrook, Clerk, Council Offices, Gasworks, Birstall	" 6
Leith—Paving Wardie-road and Ashley-place	Council	T. B. Laing, Town Clerk, Town Clerk's Office, Leith	" 6
Abbotsholme, Rochester—Roadmaking at Head School	H. Cecil Reddie	Sugden and Son, Architects, Leek	" 6
Brookley, S.E.—Kerbing, Tar-paving, and Metalling Merritt-rd.	Lewisham Board of Works	The Offices, Lewisham Town Hall, Catford, S.E.	" 7
London, E.C.—Paving with Asphaltic Norwich-ct., Fetter-lane.	Commissioners of Sewers	The Commissioners, Guildhall	" 7
Windsor—Roads and Sewers	Alma Park Estate Company	T. V. Davison, Elmdeale Chambers, Frances-road, Windsor	" 11
Swindon—Sewering and Metalling Back Roads	New Town Urban District Council	Henry Kinneir, Clerk, Regent Circus, New Swindon	" 13
West Ham—Making-up and Paving Various Streets	Corporation	Fred. E. Hilleary, Town Clerk, Town Hall, West Ham	" 14
Blackpool—Street Works	Corporation	J. Wolstenholme, Borough Engineer, Market-street, Blackpool	" 16
London, E.C.—Paving, &c., St. George's-road and Trower-street	Sanitary Authority	The Borough Engineer, Town Hall, Preston	" 17
Reading—Paving and Kerbing Thames-avenue		G. W. Preston, Clerk, Vestry Hall, City-road, E.C.	" 18
Mill Hill, N.W.—Laying-out and Completing Two New Streets		John Bowen, A.M.I.C.E., Borough Engineer, Town Hall, Reading	" 21
Sandwich—Sewering and Metalling Stevens-rd. and Brook-st.		Arthur G. Spencer, M.S.A., Surveyor, 17, Coleman-street, E.C.	
Knarborough—Roads and Sewers, Rennison's Gardens Estate		A. R. Calvert, Surveyor, Nottingham	
		Arthur A. Gibson, Surveyor, 8, Cambridge-crescent, Harrogate	

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2240.

FRIDAY, DECEMBER 10, 1897.

FLOOD AND FIRE.

LAST month the Metropolis was aroused by a fire of appalling magnitude and rapidity, which spread through masses of brick-built warehouses of comparatively modern construction. Last week a hurricane of great fury, accompanied by a flood-tide, caused immense destruction along our south and east coasts, and overwhelmed inhabitants in the low-lying parts of the Thames course. The scene at Woolwich Arsenal has been described as one of desolation and despair. The flood had inundated all the basements, boiler-houses, and sheds; the river walls and other substructures have been damaged or washed away; while higher up the river, at Staines and Richmond, extensive damage has been reported. At Sheerness the inroads of the sea swept away a large portion of the pier, and sea-walls at Queenborough and other places have been damaged. Other damage to sea-walls and other structures has occurred on the north-east coast and the Norfolk and Suffolk seaboard. The towns of Skegness, Mablethorpe, and Sutton-on-Sea have been flooded.

A great deal of this desolation and loss of life and property might have been averted if ordinary precautions had been taken by the local authorities in levels and construction. Much of our sea-coast and riverside building is practically below the level of the high tides. For the sake of economy, business, and other considerations, warehouses and stores have been built close to the water's edge, and in numerous seaside towns may be seen houses and villas so near the cliffs and even below them, that any extraordinary tide, raised by the force of hurricane would speedily render them unfit for habitation. Take, for example, a good deal of the property along the harbour end of Folkestone, which is exposed to heavy seas. At Eastbourne and also at Sandgate hotels and residences may be seen whose basements are swept by the waves at certain periods of the year, or so close to the sea that they are in danger of being swept away at any moment. The mistake is in forming roads and letting land for building that are below a flood-tide level. Roads at Sandwich, Ramsgate, and land at Herne Bay and Whitstable, near the sea fronts, were rendered impassable, the doors and windows of dwellings were below the level of tide, and houses were rendered tenanted through the inpour of sea-water and the dashing force of the waves, which hurled tons of shingle into the basements. Water is said to have flowed through some streets of the latter town to a height of nearly 4ft., and at a great velocity. The same tale of submersion comes from other places along the Lincolnshire coast. In all of them the effect of a tidal wave has been neglected by local building authorities. Take Purfleet as an example. Here the insurgent waters have broken through the stone and earth sea-wall, which hitherto shut out high tides, and flooded and rendered homeless hundreds of labouring families. The repair to the river wall is estimated at several thousands.

Around the many factories at or near Purfleet rows of red-brick cottages or tenements have been erected for the workmen on marsh land reclaimed from the river, and much lower than its high-tide level. In some cases the water of the flood rose above the ground floor of the cottages, and the hapless tenants were rendered home-

less. The river-wall could not withstand the fury of wind and tide; but those who built this protection probably never thought that buildings would be erected on the level of the marsh. The London Building Act (section 122) enacts that it is not lawful for any person to erect any building for a dwelling upon "land of which the surface is below the level of Trinity high-water mark," and which cannot be drained by gravitation into a sewer, except with permission of the Council, and they have power to prescribe the level of the lowest floor. They have also power to make by-laws as to the levels, surface, &c., of sites for new buildings. Yet, in spite of these rules, dwellings still continue to be erected on ground below high-tide level even in places subject to the rule of the Council. These waste and marsh lands are cheap; hence the temptation to build on them near large factories. Embankments and river walls are often constructed, also in a temporary manner, and without any reference to tidal action. The materials of many of the walls that have yielded are stone and earth. Canvey Island, near the mouth of the Thames, has greatly suffered. It is a marshy flat, and was once covered at every tide, till a sturdy Dutchman built a sea-wall and drained the land. It was dyked and cut with drains; the stone wall on the south side appears to have resisted encroachments; but it is the earthen wall on the north side that has given way, and let through the sea, and many farms have been submerged and cattle lost.

The problem of bank protection has scarcely received the attention which might have been expected from an insular country like England. In Holland and in America the subject has been dealt with by many leading engineers. The bank revetment on the Lower Mississippi, for example, is a theme that has engaged much attention from the engineers of the United States. Banks of brushwood, willow, cane, and straw have been used for river protection from time immemorial, and the woven fascine revetment has been found a valuable barrier. In our seacoast towns, local chalk, rock, and other materials have been largely used for sea-walls and groynes; but the mode of construction has been left too much to chance. Sloped embankments, and upright walls slightly battered or curved, have been indifferently used. Each has its merits and defects. Brighton has paid dearly by periodical incursions of the sea; the groynes of concrete that are now replacing the old timber ones show at what cost these protecting works have been undertaken. That they have answered their purpose in resisting denudation and wave-action cannot be denied. Why have not other sea-coast towns constructed similar defences to prevent erosion and caving? The flat meadowland about Whitstable which has been submerged, driving out of their cottages many tenants, might have been made safe if groynes and a sea-wall had been constructed, though, of course, the authorities are to blame by allowing jerry-builders to build houses on such wastes as they have done at Harwich and Felixstowe. Our eastern and southern coasts have been visited by these tidal incursions for centuries, and many rocks and buildings bear witness to the gradual wasting of the coast. It has been estimated that the Norfolk coast, which has suffered so much, has been wasting away at the rate of two yards a year in some parts near Cromer. At Eccles, the tower of the old church remained on the shore as a record of sea incursions; the ruined church of the Reculvers on the Kentish shore is another instance, the rocky stacks known as the "Parson and Clerk," near Dawlish, till finally swept away in a storm three years ago, the marine denudation going on at Folkestone and elsewhere attest the same action. No doubt the cost of constructing permanent

barriers is greater than small towns like Whitstable can undertake without Government help. One point also in the disastrous submersion of the last week ought to be noticed—the absolute necessity of guarding all small creeks and tributaries, and even dykes into which the sea-water can find an entrance. Unless these can be closed by dams or gates, a sound and well-constructed sea-wall along the sea-front is useless. This weakness has been shown at Canvey Island, where the sea-wall was intact; but the water found its way over the land by a backwater, and at Harwich where the tide forced it way up cracks, water-courses, and fissures.

Then not a few sea-walls are barely high enough to prevent a tidal wave, backed up by wind, from making a clear breach over. At Sheerness, for instance, the troops and seamen have been engaged in heightening the sea-wall. When we hear of land being submerged to a depth of 8ft. in some places, it is a proof that the defences are too low for any extraordinary tide. In other cases it has been found that the sea-walls withstood the immense pressure, but the water found its way through weak places in the embankments, caused by the dry weather. In this way the water honeycombed the embankments, and finally swept away long lengths of the bank thus weakened. Through narrow breaches the sea forced its way, in the first instance, widening them till a stream of torrent-like force was formed. Does not this incoherence show the want of a more tenacious material to resist the tide? If concrete is not used, other means must be employed; but the interrupted revetment is a failure: the water attacks the bank or wall in the unprotected intervals. The woven continuous mattress we have before described has been found to be a great protection in the States. Various kinds of mat construction have been used for this purpose; but those found most efficient are woven sufficiently close and compact to prevent the erosive action of the water through the openings between. Why cannot our weaker banks be similarly strengthened?

Fire has been another fell destroyer—the arch-fiend of city life; but how very little all our appliances and organisations have done to render the spread of fire impossible! The family who lives on an upper floor of a house in our crowded cities, or has rooms in a block of flats, is nightly at the mercy of some irresponsible or drunken lodger. Occupants of houses which adjoin theatres or stored warehouses cannot be sure that a fire will not some day overtake them, and destroy all they possess. The modes we adopt for illumination, guarded as they are, are still sources of danger. Every restaurant and tavern or shop, with its flaring lights of gas or electricity, are perils in our midst. Have we ever estimated the amount of heat that is wasted at the top of a room or a bar, which is daily converting the floors into desiccated material ready to ignite on the least accident, or the amount of inflammable material in the shape of match-boarding in ceilings and partitions and shelving, to say nothing of dried combustible goods and wares? All these are perils. Even the electric wiring of our buildings may, by bad fixing or insulation, cause a fire; but the naked, flaming, unprotected gas-burner is the worst enemy. Many lessons have been taught by the late City fire. As one of our correspondents pointed out last week, the newspapers have been grumbling unnecessarily at our fire-brigade appliances and their shortcomings, forgetting that if we insist on using combustible materials, like match-boarding to walls and ceilings, cheap wooden roofing, partitions and floors, and lead gaspipes, we cannot expect any abatement of this terror. We have now several fire-resisting

materials and modes of construction, that can be employed to protect girders, floors and columns, and other structures. Great resistance, for instance, is afforded by many of our fireproof floor systems, fireproofing materials like "Asbestic," the metal lath, and other applications well known to this journal. Those who have tried them can bear testimony, and it seems little short of blind fatuity that we should go on using inflammable materials without due precaution. If the precautionary rules suggested by another correspondent were generally adopted, we should have fewer destructive fires as that of last week, and it is for the Building Act to prevent the use of inflammable materials in buildings, and at least to encourage better methods of construction. We believe the majority of our great fires are attributable to flimsy and inflammable buildings, which become veritable tinder-boxes, and to imperfectly protected, so-called "fire-proof," structures, in which the most ordinary precautions have been neglected.

The City Commissioners of Sewers will no doubt turn their attention to the area of ruins in Cripplegate, and out of the present chaos will organise a new scheme of rebuilding. It is said that new buildings of the worst type of jerry-building had been allowed to occupy the exact sites of the old ones, that no facilities for increased traffic had been made, nor the slightest security provided against fire. There will be no excuse now in postponing the improvements demanded in this crowded area of the City. Nor can there be any further excuse for delaying the strengthening of our sea-defences, which have been destroyed by the recent flood, and so preventing a recurrence of a calamity that has fallen so heavily upon the poorer inhabitants of our sea-coast towns, and has carried desolation and misery to so many homes.

PRACTICAL QUESTIONS.

SIGNS are not wanting that the profession begin to see that the practical and the technical factors of architecture cannot be any longer subordinated to what has been called, for want of a better term, "artistic." True art has ever been associated with honesty of intention and good craftsmanship, and it is only the later tradition of an era of archaeological study and dilettanteism that has conjured up a new meaning to that elastic word. But professional custom or usage dies hard. The addresses of presidents of architectural societies have often been filled with a kind of mingled wrath for those who disturb the calmer atmosphere of professional society by even hinting that there is anything wrong in our existing arrangements, or by suggesting that a basis of architecture must be found more in accord with the older building traditions, and at one with the practical requirements of the day. The same note of disturbance or distress comes from the addresses of the presidents of the Institute and Association, the remarks by the president of the Birmingham Architectural Association, and those of the Society of Architects we reported in our last issue. And yet all are obliged to admit greater importance should be attached to practical subjects—construction and the design in materials. In every one of these annual utterances, a share of attention is given to workmanship. We remember the addresses of men like Barry and Scott and Donaldson and the older school. We heard very little of practical questions; building materials and workshops were almost considered *infra dig.* in an inaugural address, and were considered impertinent intrusions on the part of any speaker who brought them up. But it is very different now. Professor Aitchison speaks of making students design, not only in old-world materials like wood, brick, and stone, and marble, but in new materials like cast iron. Still more pregnant in meaning

were the remarks made the other day by Mr. Charles E. Bateman before the Birmingham Architectural Association. Thoroughly practical was its "note." Mr. Bateman struck a good vein of thought when he said that the commercial spirit of the age and its business needs—its trade, ought to be turned to account in the design of the architect, as the old traders of Bruges and other Belgian cities turned the commerce of their time to glorious account, which have become models of all that is poetical and picturesque in building. Again, he showed how careful planning ought to be utilised in our crowded cities, how supports may be minimised by the use of iron, and even trade competition be made a gain instead of a disgrace, as it is now. Buildings, too, should find their proper expression. The factory is a building that should not be neglected, as it often is, but be grasped and made a source of effect. Then there is mechanical contrivance, which we cannot escape from in these days, but to which the architect should try to lend the graces of his art to make agreeable. Many similar instances may be found in this practical paper on design, as discarding patterns, caution in copying Continental work so as to preserve the effect of scale. The author thinks it worth while to remind the student that the workshop and craftsmanship influence exercise a welcome restraint in bringing us to face the limitations of materials and difficulties of execution. No doubt it is a "hobby that can be ridden to death." There is a true and false way of presenting it to the student. Well may the young architect who has succeeded in passing his "preliminary" or "intermediate" revolt against the idea of being required to learn half a dozen, or only one, handicraft as well as any skilled craftsman;—such a scheme is only doomed to failure. At the same time no one can dispute that our leading architects and designers are men who have made themselves especially familiar with materials and the difficulties of execution; the mere office or draughtsmanship ideals, they have appraised at their true value.

Practical was Mr. Walter Emden's address the other day before the Society of Architects. We do not touch here on his sensible remarks on registration of architects—the only way by which the capabilities of an architect can be known or guaranteed to the client who employs an architect because he likes his work or his taste. Some useful suggestions on building law, public health, and sanitation are made. Every practical architect knows how many difficulties he has to encounter in the exercise of his profession. One of his greatest is the overlapping jurisdiction of local authorities. He may be well up in his professional duties, but be subjected to innumerable insults or delays, if he does not know the machinery of legislation and administrative control. The overlapping of the powers of various authorities, as Mr. Emden says, is "a crying evil in London, where the central authority deals with frontage lines, projection, construction, and all such like matters, and puts in action its own surveyors; though there is in each district the surveyor of the local body also dealing, more or less, with the same subjects." Few in the profession have not been subjected to this vexatious kind of interference or obstructive officialism. Plans for new buildings and alterations are frequently delayed by local interference. The surveyor of the local body has required certain alterations to be made, under by-laws as to projections and sanitary matters, after have passed central authorities. In some cases the delay is a serious hindrance to building, and local by-laws are enforced which ought to have been settled by other authorities. It is a practical suggestion that the central authority should lay down rules and regulations under such Acts as

deal with these questions, after consultation with the local authorities, and that the latter should administer them. No doubt by this arrangement much trouble would be saved, both to building owners and to the public, who would, by preventing the duplication of officials and friction, save delay and expense in building. The passing of plans for buildings is often a complicated process, as many architects find to their cost. It is further suggested that one surveyor in each district should be employed, and the central authority delegate the administration to the local board under certain rules framed by them. In this way overlapping would be avoided. These and other suggestions are worth the consideration of those who are charged with the administration of our building laws.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—XI.

By AN ASSOC. INST. ELECT. ENGS.

CONDUCTORS IN PRACTICE.

DISTRIBUTION—(continued).

CARRYING CAPACITY OF WIRES.—Respecting the sectional area of conductors, the Institution of Electrical Engineers' rules state that "their sectional area should be proportioned to the heating effect of the current required for the maximum number of lamps or other current, using apparatus that can be used simultaneously on the circuit; but in no case should the sectional area of any conductor be less than that of a No. 18 S.W.G. wire. All conductors having a sectional area larger than that of a No. 14 S.W.G. wire should be stranded." For convenience of reference, a table of copper conductors has been drawn up, and is included in these articles. In this table the diameters, areas of conductors, resistances, weights, current, number of feet per ohm, and particulars corresponding to those given in table accompanying the new rules of the Institution of Electrical Engineers are given for all the important sizes of wires used, so that it will be an easy matter to pick out the particular wire required for any purpose. By referring to this table it will be noticed that for each size of wire there are four different values of current given, the latter two, in columns marked 2 and 4, have been calculated from the formulae—

$$C = 2A^{0.715}, \text{ or } \log. C = 0.775 \log. A + 0.301$$

$$\text{and } C = 2.6A^{0.52}, \text{ or } \log. C = 0.82 \log. A + 0.415,$$

to which we have already referred, whilst in the former two columns the values of the current are (1), from the Fire Office rules, to the basis of 1,000 amperes to the square inch, and (2) according to Kennelly's rule. By comparing the values given it will be observed that they vary considerably, and it will be necessary to explain why so many values have been included in this table. In the majority of cases internal wiring has to satisfy the rules issued by the fire insurance company with which the building may be insured, and as a current density of 1,000 amperes per square inch of cross-sectional area satisfies most companies, values to this basis are given. It must, however, be borne in mind that these values only serve as a guide for determining the proper size of wire to use for short lengths of wire, such as the internal wiring of houses, &c. As an example of the various rules issued by the fire insurance companies bearing on this point, the following, taken from the Phoenix Fire Office rules, will be interesting:—

"For currents up to 100 amperes, a current density of 1,000 amperes per square inch may be employed. For larger currents, a less current density must be used. In any case, the conductors must be absolutely safe with regard to heating, even if the current should become doubled."

In no case must the Fire Office Rules, however, be followed for determining the proper gauge of wire to employ for wires imbedded in conduits, &c., as the permissible drop of potential forms the basis for the gauge of such conductors. From the insurance point of view, the fire insurance company rule is all-important; but when we remember that the heating effect is proportional to the square of the current, and that the current—according to this rule—is proportional to the area of cross-section, which increases as the square of the diameter, whilst the heat radiated is proportional to the surface of the

TABLE OF COPPER CONDUCTORS.

conductor, and this is directly proportional to the diameter. Consequently, as the wires increase in diameter, the temperature increases at a too rapid rate, and it is clear that small wires will carry more than this rule allows, whilst large conductors should have a less current density than the fire offices allow. This is very apparent when we compare the current density according to 1,000 amperes per square inch with that given by Kennelly's rule. From an engineering point of view, the values given under the Institution of Electrical Engineers' section are more specific, and are recommended in all cases.

Calculations for Cross-Section of Conductors.—Although the accompanying table is invaluable, and may be used for many problems occurring in practice, still, there are many points of detail which demand special consideration. In many cases, for instance, the permissible drop in volts for a given length of cable has to be taken into account as well as the current density, and many engineers have drawn up wiring rules to assist them in making their calculations. A very simple and useful rule, known as Sayer's wiring equations, will now be described. It was published in the *Electrician*, Jan. 31, 1890 (Vol. XXIV), and, as will be observed, it is simply an extension of Ohm's law. Thus, if—

l = length in feet of wire (lead and return),
 C = average current strength to be carried,
 e = drop in volts for l feet of the wire,
 K = feet per ohm resistance of cable.

Now, by Ohm's law—

$$C = \frac{e}{R}, \text{ and } e = CR; \text{ but } R = \frac{l}{K}.$$

$$\therefore e = C \times \frac{l}{K}, \text{ and } K = \frac{Cl}{e}.$$

Now, K is of the nature of a constant for each gauge of wire, the various values being given in

the accompanying table. The following examples illustrate the method of using these equations:—

(1) A corridor is 100ft. long. Determine the size of cable to carry an average current of 15 amperes with a loss of 0.5 volt.

$$\text{Since } K = \frac{Cl}{e}, \therefore K = \frac{15 \times (2 \times 100)}{0.5} = 6,000.$$

and the cable with a value of K nearest to 6,000 (see table) is 19/17. Consequently, a 19/17 cable would be used.

(2) A cable 200 yards long (lead and return) of 19/18 carries an average current of 7 amperes. Find the drop in volts.

$$\text{Since—} \quad e = \frac{C \times l}{K}$$

$$\text{And—} \quad C = 7 \text{ amperes, } l = 200 \times 3 = 600\text{ft.}$$

$$\text{And—} \quad K \text{ for 19/18 cable} = 4,128$$

$$\therefore e = \frac{7 \times 600}{4,128} = \frac{4,200}{4,128} = 1 \text{ volt.}$$

(3) What current can a 7/16 cable carry for a distance of 80 yards with a loss in pressure of 5 volts?

$$\text{Since—} \quad e = \frac{K \times C}{l}$$

$$\text{And—} \quad K \text{ for 7/16 cable from table} = 2,700$$

$$e = 5 \text{ volts, and } 80\text{yds} = 240\text{ft.} = l$$

$$\therefore C = \frac{2,700 \times 5}{240} = 56.25 \text{ amperes.}$$

(To be continued.)

CONSTRUCTION OF ARCHES IN CONCRETE.—XIV.

WE have now investigated and recorded all those details respecting the actual experiments undertaken with arches built of stone, brick, concrete, and concrete in combination with

iron and steel, which we judged worthy and possessing both interest and valuable information for our readers. After having ascertained the manner in which arches constructed of the materials already mentioned behaved when submitted to tests of so severe and crucial a character as to be carried to the point of fracture, it was resolved to add one more example to the list. It was considered, and very properly too, that the trials would not be complete until an arch of similar dimensions and proportions to those previously experimented upon, but composed solely of wrought iron, was tested likewise at our entrance. Cast iron always was, and although of recent years greatly superseded by its wrought iron and steel rivals, is to some extent still a favourite material for bridges of that particular type. Old Southwark Bridge with its unsurpassed central span of 240ft., still holds its own bravely, though the weight now thrown upon the old structure was never contemplated by its designer, Rennie. No doubt the load brought upon an ordinary road or street-traffic bridge is considerably lighter than that to which a railway bridge is subjected. At the same time, cast-iron arches of a span of 200ft. are still doing good suit and service upon our own lines of railway.

Mild wrought iron was accordingly the material selected for the experimental arch which now claims our attention. Its principal dimensions were as follows: The span was 76ft., and the intradosal rise 15ft. 2in. There is one peculiarity in this arch which was not shared in by the other competitors, and is deserving of notice. Instead of the axis, and consequently the contours of the soffit and extrados, being of the usual curvilinear or segmental form, they were made polygonal, as will be subsequently seen from the drawings we shall give of the whole general design. One reason for adopting this particular form, was

that it facilitated the putting together and the building up of the structure. Another was probably due to the fact that the parabola is the correct curve for the line of pressure of an arched rib when under a uniformly-distributed dead load. When a live load is substituted for a dead load, the ellipse takes the place of the parabola, or should do so, if practical requirements and exigencies did not demand that the dictates and assumptions of theory must frequently be modified, to a greater or lesser extent, in actual construction. As a matter of fact, the curve usually adopted is the segment of a circle. When a given proportion of depth to span is not exceeded, it adequately fulfils sufficiently approximately the conditions governing strength and stability. Besides, it is a much simpler and more economical method of carrying out ironwork in the "sheps," to use a constant or radial templet, than a dozen or so due to the number of ordinates needed for the accurate delineation of the other conic sections. As examples of the three forms with which we are all acquainted, it may be stated (adhering as much as possible for the present to metallic iron arches only, and selecting those over

which the position is known. From any points G, G_1, G_2 , equidistant or not in the line D, D_1 , plot off perpendiculars to it in the directions of $G P, G_1 P_1, G_2 P_2$. From the point F draw lines $F P, F P_1, F P_2$, intersecting the lines drawn from the points G, G_1, G_2 in the line D, D_1 , and perpendicular to it, in such a manner that $F P = P C, F P_1 = P_1 G_1, F P_2 = P_2 G_2$, and so also for the other side of the vertex of the parabola at C . If the point P be supposed to move so that it occupies successively the positions shown at $P_1, P_2, A, P_3, P_4, P_5$, it will describe the parabola $P A P_5$. It is scarcely necessary to point out that $F A = A C$, and that the points $P_1, P_2, \dots, P_5$ must all be in the same plane with the line D, D_1 , and the point F . A few other particulars are required before we can obtain the value of the parameter of the metallic arched rib. The line D, D_1 is termed the directrix, and the point F the focus of the parabola. The line $F A C$ represents in direction the axis or principal diameter of the parabola. It is a property of the parabola that if y denote any ordinate to a diameter, and x represents the corresponding abscissa, and P = the parameter of the diameter, then we have the general equation—

$$y^2 = P \times x \dots \dots \dots (1)$$

which is also known as the "equation to the parabola." It may be observed that in geometry the parameter signifies a constant right line, which is common to the ellipse and hyperbola, as well as to the parabola. It is also called the *latus rectum*. From the above equation, by transposing, we obtain—

$$P = \frac{y^2}{x} \dots \dots \dots (2)$$

In Fig. 1 $y = P_0 F$, and $x = F A$, so that—

$$P = \frac{P_0 F^2}{F A} \dots \dots \dots (3)$$

but from the dimensions of the iron arched rib, $P_0 F = 38$ ft., and $F A = 15.2$ ft. Inserting these values in equation (3) it becomes—

$$P = \frac{38^2}{15.2}$$

from which the value of the parameter becomes equal to—

$$P = \frac{19 \times 19}{3.8} = 95 \text{ ft.}$$

The general arrangements for testing the wrought-iron arched rib were the same as those adopted for the similarly proportioned examples constructed of the other materials, so that it will be unnecessary to further illustrate or describe them. Though the depth of the rib was maintained constant throughout the whole span, with the exception of about 18 in. in length at the springings, where it was increased in order to obtain a good bearing upon the articulated pivots, which were of cast iron, the sectional area was not uniform.

There was a general minimum cross section employed, varied, however, at those points where increased stresses were brought upon the structure. These two different sections are shown in Figs. 2 and 3. The former represents the minimum section, which is built up of two flanges, consisting each of a single plate, 8 in. by $\frac{3}{4}$ in., a pair of angle irons, $3\frac{1}{2}$ in. by $3\frac{1}{2}$ in. by $\frac{3}{4}$ in., and a plate web, 1 ft. 1 in. in depth, and $\frac{3}{4}$ in. in thickness. The rivets uniting the web and flanges were $\frac{3}{4}$ in. in diameter. In Fig. 3 is shown the maximum section, which is strengthened by the riveting up of two additional plates, each 8 in. by $\frac{3}{4}$ in. This reinforcement of the arched rib at certain points will remind those who have perused our former articles on this subject, of the similar increase of material over and above the amount employed in the minimum or normal cross-section, which was given to arches built of brick and concrete. It is evident, therefore, that dangerous points, as they were termed, exist in metallic arched ribs, as well as in those constructed of other materials, and whether belonging to the simple or compound system. For the purpose of the experiment upon the iron arch, two ribs were constructed, and erected parallel to one another, at a distance of 6 ft. apart, measured from centre to centre of the web of each rib. It was necessary in order to give the *tout ensemble* sufficient lateral rigidity, to interbrace the ribs at intervals measured horizontally, of every 6 ft. Notwithstanding the comparatively small depth of the arched ribs, some system of bracing them together to resist the pressure of the wind and other disturbances which are practically unavoidable and invariably present when experimental trials of

this character are in progress, was imperative. Wind, or sway-bracing as the American engineers call it, may be introduced between the girders composing bridges, roofs, or other trussed or solid frames in three different planes—the horizontal, the vertical, and the diagonal. It may be mentioned that many descriptions of bracing may be of solid or of open work.

Both vertical and horizontal sway-bracing were employed to impart stiffness to the ribs forming the metallic arch. The former is shown in Fig. 4, which is a half-cross section through one of the main ribs. In this instance the vertical bracing consists of small lattice girders, $A A$, securely riveted to the ribs by the angle irons a . The outside angle iron a is placed to act as a stiffener, and to transmit the stress uniformly throughout the whole rib instead of allowing it to bear upon one-half only of it. Considering the small depth of the ribs, it might be urged that a lattice girder is somewhat in excess of the actual requirements of the case, and that every purpose might have been adequately fulfilled by the adoption of simple sway-rods. Perhaps so; but those carrying out the tests are, after all, the best judges of what were the real necessities of the trial, and no blame can possibly be attached to them for taking every precaution that skill and experience might suggest.

In Fig. 5 is given a plan of the horizontal diagonal bracing between the main ribs. That is, the bracing bars $B B$ are situated in a horizontal plane, but not in a direction parallel to either the main ribs R or the cross-girders G . It must not be supposed that both the systems of bracing just described and illustrated can be employed indiscriminately to all structures regardless of their form and mode of construction. It is obvious, for instance, that in an ordinary "through" bridge—that is, a bridge in which the traffic, whether road or rail, passes through between the side girders—the vertical type of sway-bracing shown in Fig. 4 could not be employed. Neither, for the same reasons, could the horizontal or lateral bracing, of which a skeleton plan is given in Fig. 5, be used in the same kind of structure for the upper booms or flanges, although it could be, and is, used always to stiffen the platform and the lower booms. It will be pointed out presently that both these descriptions of bracing can be employed to stiffen a through bridge under certain conditions which are rarely complied with. But both these types of bracing are adopted in a "deck" bridge with great facility, and that is the reason why they can be so utilised. An arched-rib bridge, to all intents and purposes, is a "deck" bridge, since the loading is all above the main ribs. Within the depth of the ribs the latter can be interbraced to any extent and in any plane.

Another case of bracing here presents itself, and may be investigated in a very simple manner. Suppose that the plane in which Fig. 5 is imagined to be turned round through an angle of 90° , and so become a vertical instead of a horizontal plane, and let CC represent the side girders of an ordinary "through" bridge. Then R may be considered to occupy the position of the cross girders. The introduction of what would now become the vertical diagonal bracing $B B$ would clearly be impracticable. As an example for illustration, we may take the tubular bridge carrying the London and North-Western Railway over the Straits of Menai. No such bracing as that represented in Fig. 5 could be employed in the interior of the tubes. It would, nevertheless, be an error to come to the conclusion that the tubes are altogether without sway-bracing. The cells comprising the flanges or booms, which run transversely across the whole breadth of the tubes, unquestionably act as vertical sway-bracing. It must, however, be admitted that their depth is very disproportionate to the duty they have to discharge, but at the time this unexampled specimen of a bridge was constructed, very little, if any, attention was bestowed upon wind-pressure. Indeed, but little or nothing was known about that important subject, and practically, even at the present time, our knowledge is still very deficient. The case which was previously alluded to—viz., that in which both vertical and horizontal bracing could be used, may be now adverted to. If the side girders are abnormally high, so as to allow of vertical and horizontal bracing being introduced above the maximum permissible height of all traffic underneath, the problem is solved. But this, although quite possible in railway bridges, is nearly impossible in ordinary road bridges,

our Metropolitan river), that the ancient moribund structure at Vauxhall is segmental, and so also, which is more apropos to the question, is Blackfriar's Bridge. Westminster Bridge, unquestionably the handsomest anywhere and everywhere over the Thames, belongs to the parabolic type, although it is not exactly a pattern to follow. For the elliptical and segmental forms, reference must be made to Waterloo Bridge, which is, similarly to that at Vauxhall, on its last legs, and to London Bridge.

The axis of the arched rib under consideration is itself a polygon, each joint or apex of which is situated upon a parabola, having a certain parameter, which can be readily calculated from the data which are supplied. It will be as well, perhaps, to explain this identity a little more fully for the benefit of our younger readers, the more especially as the parabola, the ellipse, and hyperbola, which certainly do belong to the domain of co-ordinate geometry, are frequently looked upon as quite incomprehensible without the aid of the higher mathematics. Generally, let D, D_1 in Fig. 1 be any given straight line, and F any point situated anywhere except on the straight line D, D_1 itself, and of

FIG. 1.

FIG. 2.

FIG. 4.

FIG. 5.

because in those over public roads, streets, and main thoroughfares, a minimum height of a clear 16ft. must be left between the level of the road and the lowest part of any standing work above. In other words, neither vertical bracing nor horizontal nor lateral bracing can be employed in "pony truss" bridges. There is one other form of bracing which is rarely used in bridge and roof designs, but very much adopted in other descriptions of building construction. It is frequently necessary to brace a large and high aperture, or walls or columns which are in positions which do not permit of cross or diagonal bracing, or of vertical bracing in the ordinary sense of the term. The description of bracing employed for examples of this character is known as "portal bracing." It is very seldom used in this country, but is common where "sky-scrappers" abound. It may be either of the solid or open type, but the preference appears to be given to the latter. T. C.

ARCHITECTURAL ASSOCIATION.

THE fortnightly meeting of the Architectural Association was held at 9, Conduit-street, W., on Friday evening, the president, Mr. Hampden W. Pratt, F.R.I.B.A., in the chair. Messrs. C. J. Butcher, A. St. John Diment, A. G. Ross, J. Henry and W. H. Williams were elected as members, and Mr. A. G. Anzel was reinstated in membership. Mr. E. HOWLEY SIM, the secretary, proposed a vote of thanks to Mr. G. B. Carvill, F. D. Clapham, and Leonard Butler for their services in connection with the very successful entertainment and musical play given on the previous Friday, and also to Messrs. R. Phené Spiers, A. H. Hart, W. H. Atkin Berry, W. G. B. Lewis, C. C. Dukie, and the members of the Water-Colour Class for the loan of drawings and photographs exhibited on that occasion. The name of Mr. A. Cox, who designed the cover of the programme, having been added, the motion was carried with hearty applause. The President announced that the next concert of the A.A. Lyric Club would be held on Friday, the 10th inst. (to-night) at the Club-rooms, Swallow-street, Piccadilly, and that a General History Class would be commenced on Thursday, the 23rd inst. A number of donations to the library were announced by Mr. HOWLEY SIM, and acknowledged with thanks. A paper on the subject of

HIGH SCHOOLS FOR GIRLS

was read by Mr. J. OSBORNE SMITH, F.R.I.B.A., and was illustrated by numerous plans and elevations, and by very clear lantern slides. During the past twenty-five years, the author remarked, a goodly number of these schools have been established, and for a lesser number special buildings have been erected. The requirements have naturally grown, and experience has taught many valuable lessons to all concerned. High schools are superior day schools for girls of all classes above those provided for by the Elementary Education Act. There were no high schools twenty-five years ago: the word "high" was not used as applied to schools until the incorporation of the Girls' Public Day School Company, Limited, in June, 1872. The starting of this company to establish and maintain in London and the provinces superior day schools forms an epoch in the education of the larger half of the inhabitants of England. It was an attempt to meet and correct the defects pointed out in the report of the Schools' Inquiry Commission:—"Want of thoroughness and foundation; want of system; slovenliness and showy superficiality; inattention to rudiments; undue time given to accomplishments—and these not taught intelligently or in any scientific manner; want of organisation." The first school was opened in January, 1873, at Chelsea, in an old house adapted for the purpose. There are now thirty-four schools belonging to this company, and various others have been established by limited liability companies, which were formed usually to establish individual schools. Existing premises, more or less adapted for the purpose, formed the first homes of many flourishing schools now housed in buildings the planning of which is based upon the knowledge thus gained. Work carried on in buildings originally erected as private residences, or for other purposes, revealed almost hourly weak places where time was lost, where adequate supervision was impossible, and where it was hopeless to combat the evils attendant upon tem-

porary and ineffective means of ventilation, low and small rooms, narrow staircases, weak floors, falling ceilings, small and dark cloak-rooms, small fireplaces, insufficient light, and other defects. These drawbacks to effective teaching were well remembered, discussed, and digested whenever a new home was in view, and the new schoolhouse, planned and erected for a definite purpose, became at once an added pleasure to the daily lives of both mistresses and pupils, and an effective aid to education. One of the most

PROMINENT CHARACTERISTICS OF A HIGH SCHOOL

should be cheerfulness produced by ample lighting, plenty of sky visible, possibility of the sun himself being able to peep into every room, pleasing wall surfaces, good pictures, &c.; all these, except, perhaps, the last, form a part of the design, and if the architect will make tempting provision for hanging pictures in suitable positions, the pictures will soon follow. Gloom and semi-darkness should find no place where children are being taught. Spaciousness, too, is an important quality to secure; ample floor-space is here meant—not loftiness. Class-rooms need not be lofty to be healthy; an excessive cubic space above the pupils' heads makes ventilation and warming more difficult, and is simply inclosed space in the wrong place. It is obvious, also, that inasmuch as it is found desirable to limit the number of children in a class to thirty or forty, the floor-space must be limited to dimensions which will enable the mistress to keep the pupils well under control, to speak to them all effectively without strain, and have access to each desk without disturbing the pupils at adjoining desks. These considerations, as well as those of access to the room, space for and around the mistress's desk for teaching apparatus, &c., must be regarded as determining the extent of floor-space, even when it is not urgently necessary to keep always in mind the cost of every cubic foot of space to be inclosed. When the room is warmed by the usual open fireplace, the best position for that cheerful, if wasteful, contrivance must not be overlooked, because it also demands a portion of the available floor-space. The relative positions of the door and fireplace in relation to the windows deserve more consideration than is usually given. Waste of space necessarily arises where both door and fireplace are not situated at the end of the classroom occupied by the teacher. It is not convenient for the fireplace to be in the centre of the end wall; sometimes it may be well placed near the door. The corner of the room on the right hand of the teacher is a position with many advantages. The fireplace should contain some form of ventilating or warm-air producing grate, with fresh air brought to it from outside well above the ground, all inlets being short and accessible for cleaning; the air-chamber for warming the incoming air ought also, for cleanliness' sake, to be readily accessible. In large rooms, or where there are two or more external walls, it is sometimes found desirable to supplement the fire by hot-water pipes under the windows or along the wall opposite to the mistress. Open fireplaces should not be omitted from schools of this kind without very full and serious consideration of the means to be employed to warm and ventilate the buildings, and especially the classrooms. A form of classroom for thirty pupils, which, from its frequent use, may be accepted as convenient both in shape and size, shows an allowance of floor-space per pupil of 13ft. 6in. super. (or 13-6ft., to be quite accurate), and the cubic space of 163-8c.ft. per child. Space should be provided between the walls and desks for access for supervision, and to enable the children and mistress to write or draw upon the slates or blackboards upon the walls. Movable blackboards are inconvenient appliances; but as they are less costly than continuous slates, the inconvenience still prevails in too many instances. It is possible still to find classrooms with windows, blackboards, and desks so arranged that it is impossible for all the scholars to read what has been written or drawn for their instruction. The ceilings should be as much as possible unobstructed by beams or other timbers which prevent the ready flow of air or check or divert the air currents. A point which affects the health and comfort of teachers is the provision of windows at the back of the children. If these windows happen to be in a south wall, the evil becomes very trying. A teacher stated a few months ago that one of his eyes was seriously injured from having to face a south window; moreover, under such conditions some of the pupils' features are

in shade, and it is not possible to distinguish the effect of the teacher's remarks upon the children. Except in cases of special difficulty, it is possible to effectively light any class-room, large or small, from windows in *one wall only*. An additional window may be useful for obtaining direct sunlight in an otherwise sunless room, or for securing cross-ventilation not otherwise obtainable; but it will be found desirable to make that window smaller than the rest, or to place it in a corner of the room, or to arrange means of regulating the light from it when required. The chief use of the assembly-room or

CENTRAL HALL

is to accommodate all the pupils at one time daily, and its size is fixed accordingly. If the school is thought likely soon to expand beyond a normal standard, this room may be built to accommodate a maximum number of possible pupils. This hall may serve for access to the classrooms upon two floors, a consideration by which its height is often determined. The supplementary purposes for which the hall is used also affect the floor-space, shape, and dimensions. This important room should be near the principal entrance, and have ample means for access; it was a common defect in the earlier schools that only one entrance was arranged. This should be regarded as inadmissible, except in very small schools. The position of this room in relation to the classrooms is probably the most important factor in determining the general plan of a school. Side-lighting for this hall is preferable, for the sake of ventilation. Where top-lighting is used, great care and judgment are required to avoid too much glass, which, moreover, should be placed as near the sides as possible, in order to prevent deep shadows being cast upon the floor from the balconies. Centre top-lights are rarely successful for schoolrooms of any kind. Good acoustic conditions ought to be secured for this room.

PLANNING.

For convenience of consideration, plans may be divided into three types—viz., (1) those which have the principal classrooms and the assembly-room separated by corridors, as in this slide; (2) those where the classrooms are grouped round a central hall; (3) those which have classrooms on one, two, or three sides of the assembly-room, leaving the fourth side an external wall. The difficulties of a contracted or otherwise comparatively unsuitable site often lead to varieties of treatment not included in either of these types. These may be regarded, however, as exceptional plans adapted to special situations rather than typical examples. Sometimes a feeder is fostered in the form of a kindergarten room, which should be exceptionally cheerful, on the sunny side of the ground floor, near to the pupils' entrance, and to separate lavatories. A spacious room for drawing purposes should face north or east, with as much floor-space as can be afforded, and wide doorway, fitted with cupboards, rails and shelves for models, racks for boards, drawers for paper, drawings, and materials, a sink, dark blinds, &c., well lighted from one side or end. Usually the best situation for this room is upon the top floor. Laboratories for teaching chemistry and physics (separate rooms for each if possible), with impervious floors, ample side or top lighting, and special means for ventilation, fitted with working tables, with water, gas, and electricity laid on. Also a small room for balances, cupboards for stores, apparatus, &c. The size of the laboratory must depend upon the extent to which science is taught in the school. It should be lofty, well lighted, with the windows just above table height and extending to the ceiling; ventilation must be specially studied, particularly the means of readily producing cross currents of air at the levels of the worktables and ceiling. It is convenient sometimes to plan a separate building for science teaching, a covered playground fitted as a gymnasium, a luncheon-room for mistresses and pupils, with the kitchen, and offices, and housekeeper's rooms adjoining. These domestic rooms should be planned with a separate entrance, and be cut off from the schoolrooms, with prompt access from the kitchen to all the school entrances, and from the school to the dining-room. On no account should any of the noise or odours from the domestic rooms be allowed to enter the school proper. Well-lighted and ventilated cloakrooms, not less than 9ft. high, and large enough to afford floor-space for fittings, should also be provided. The best position for cloakrooms is, of course,

near the pupils' entrance. Stands for cloaks should be about 6ft. apart from centre to centre, and about 1ft. lineal of stand space should be allowed for each pupil, with means for drying wet clothes. A sitting-room for assistant mistresses should overlook the playground and its entrances, and be reasonably near to the head mistress's room. A small cloakroom and lavatory are convenient and desirable adjuncts. It should not be less in size than an average classroom. The glass line of the windows should be nearer the floor than in the classrooms; in this, as in other respects, the room should be regarded as a workroom and sitting-room combined. The head mistress's room, with secretary's room and a small waiting-room, must be near the chief entrance, and the platform end of the assembly-room. Neither of them need to be so large as a classroom; but from the windows of the head mistress's room it should be possible to see the main entrances to the building. This room is a workroom and also a reception-room; it should be well lighted, cheerful, and convenient, with a lavatory near at hand. Stairs should be of reasonably fire-resisting materials which will not become slippery, have easy gradients, wide treads, and shallow risers, suitable for the younger children, thoroughly well lighted, and at least 4ft. wide, to enable two files of pupils to pass each other. Those to cloakrooms, or where there is an exceptional amount of traffic, should have handrails on both sides to prevent accidents, and be, say, 5ft. wide. The position, form, and size of the staircases are most important—no greater inconvenience in a school can be conceived than a carelessly designed staircase in the wrong place. A building designed to accommodate more than, say, 150 children, should have two distinct staircases, as far apart as possible, but both near the assembly-room. Windows and circular or elliptical staircases are inconvenient, and ought never to be planned for these schools, wherever it is possible to avoid doing so. The rise of each step should not exceed 6 $\frac{1}{2}$ in.—6in. is better when obtainable; 11in. should be the minimum width of the tread (from nosing to nosing). Staircases need not be lofty, if sufficient head-room and ample lighting be secured. Lavatories with washbasins to accommodate, say, 5 per cent. of the pupils at one time, and closets for, say, 3 per cent., can be in most cases arranged on two or more floors in a separate wing or other suitable position, disconnected from the main building by a staircase or well-ventilated corridors. A bicycle store or shed has now become an essential requirement, as girls now ride to school in great numbers. Last, but not least, a spacious levelled playground for tennis and other games, small border gardens for the pupils' botany specimens, cricket and hockey meadow, &c. Seven feet is a desirable width for main corridors, which should not be of less height than the rooms adjoining. Windows at each end are essential, and there should be ample lighting throughout, especially at points where they deviate from a straight line. Having thus briefly noted the requirements, let us now consider the

THREE TYPES OF PLANS

before mentioned. It will be seen that in the first or corridor type the assembly-room is treated as a separate room, and does not afford access through it to other rooms. It can therefore be used for special purposes without causing inconvenience or hindrance to work going on in the class-rooms, and also without the work going on in the assembly-room being interrupted by children passing through from the classrooms. That is an obvious advantage provided at the cost of constructing the corridor. The corridor constitutes the chief variation between this type and another. In an executed design of this first type the most important story is the first floor, which is approached by covered stone steps. The head-mistress's room has been placed on the right of the vestibule, and a waiting-lobby on the left; two classrooms and a corridor are entered from this lobby: other classrooms are on the right, and two at the left in a line with the assembly-room. Two well-lighted staircases, one at each end of the corridor, lead from the ground-floor to the second floor, and there are large borrowed lights between the assembly-room and corridor, and over each classroom door. On the second floor are classrooms over those below, a small laboratory over the head-mistress's room and vestibule; one of these classrooms is fitted as a science lecture-room, and a large studio at end of

assembly-room. On the ground floor are the pupils' entrance, with cloakrooms on the right and dining-room on the left, a gymnasium under part of the assembly-room, mistress's room, lavatories, tradesmen's entrance, kitchen, and offices, two rooms for special work, furnace chamber, fuel store, serving room, &c. There is access to the playground at three points. Most of the classrooms are lighted from the south-east, the assembly-room faces north-west, and the studio north-east. This school accommodates 320 pupils, and is found, after being in use for twelve years, to be convenient and suitable for the purpose. Where the rooms are grouped round a central hall, the second type of plan, some of them will be less cheerful than others, owing to the diminution of direct sunlight. The noise of drilling and singing will interfere more or less with the work going on in the adjoining classrooms, and the passing of children from the classrooms to other parts of the building will tend to disturb the work going on in the assembly-room. To set against these drawbacks, which are possibly more apparent than real, there are many advantages—viz., compactness of plan, economy of space, increased facilities for effective supervision, &c. The assembly-room gives access to two stories of classrooms, the upper ones being entered from a gallery arranged on all four sides. This form of hall is easier to light than would appear at first sight. In fact, one has to be very careful to avoid having too much lighting surface, which is also chilling surface in cold weather, and heating surface in summer-time. It is a common and fatal error to underestimate the value of a square foot of top-light—fatal to comfort, convenience, and health. The assembly-room is occasionally used also for prize distributions, lectures, concerts, private theatricals, and similar functions, and by this plan the adjoining rooms and galleries can be used to increase the accommodation for visitors and parents. Plans of the third type are a variation upon the central hall type, inasmuch as there are no classrooms upon one side, from which the hall is lighted through windows in the only external wall. In this form of plan the classrooms are grouped along the quietest or most cheerful side of the building, the assembly-room, studio, laboratory, cloakrooms, and other rooms occupying positions which are less important in this respect. Galleries are required only on one or two sides, and the drawbacks of the central hall type of plan are somewhat less in this type. The conditions of the site usually settle which type of plan shall be used. There are, of course, some sites where all sorts of variations and adaptations will be found necessary. Some peculiar and exceptional opportunities for skilful and picturesque planning arise when one has an existing building to utilise and fit in. The width of doors to classrooms should be limited to dimensions which will permit the passage of the usual movable furniture; 3ft. by 3ft. 3in. is usually sufficient. Those to studios, corridors, cloakrooms, dining-rooms, entrances, &c., should be wider, with pairs of doors hung folding or to swing, as may be found desirable. Glazed upper panels in doors, and also a second door leading from one classroom to another are very useful in assisting supervision and maintaining discipline. Glass panels are sometimes objected to for apparently good reasons; but they are usually found to be very convenient.

NOTEWORTHY POINTS AS TO WINDOWS.

The essential points to be borne in mind regarding windows are:—The chief lighting for all rooms, except those for science teaching, should be in one wall only—that on the left-hand side of the pupils—with an extra window conveniently arranged where possible for cross ventilation or extra sunlight. The glass line should be as near the ceiling as possible, and not nearer the floor than 3ft. 6in. or 4ft. in classrooms, and the glass should be clear, except in lavatories and a few other positions. The window-frames should be as near the outer surface of the wall as appearance, Building Acts, and other circumstances will permit, to afford means for obtaining admission of air without interfering with blinds, &c., and also to allow the maximum of floor-space to be used without the desks being placed too close to the glass. All windows should be made so as to be opened easily by children, and to the fullest extent possible, and should be constructed to permit portions of them to remain open, if desired, while work is going on, without the possibility of downward currents of air being felt by the pupils. The most suitable kinds of

windows are those which can be opened most readily, and which when open will not admit rain or expose the occupants of the room to strong currents of air. French casements and centre-hung sashes, although very useful in some positions, are not as a rule desirable for classrooms. Double-hung sashes, with hopper casements over them hung to the transom are a common and useful form of window. Hopper casements hung to sill and to transom, with centre or side-hung sashes between them, are found convenient, and comply with the conditions above referred to. In the wall opposite to the windows, openings near the ceiling, fitted with hopper casements, are extremely useful in obtaining cross ventilation of the rooms during the intervals for recreation and when the school is closed. Fireplaces are conveniently arranged in the wall facing the children, not in the centre, if it is possible to place it either near the door or in the corner near the windows, especially when warm-air grates or stoves are used, as then the cold air inlets are short and accessible; it is very important that all stoves or grates used for warming the air should be capable of being taken to pieces to allow the air channels to be kept clean.

CLOAKROOM FITTINGS.

Stands from 5ft. to 6ft. from centre to centre; seats and boot-racks, with hot-water pipes below them, are usually provided. Where this is not possible, other means for occasional drying of damp clothes are desirable. Cement, asphalt, tiles, wood blocks, or similar materials capable of being readily cleaned are most suitable for the floors; cement or varnished wood for dadoes.

LAVATORY FITTINGS.

The water should be laid on to the basins and waterclosets direct from the high-pressure mains, or from cisterns placed at a considerable height above the lavatories. The diameter of the pipes will depend upon the size of the lavatory ranges or the number of closets to be served, as well as their position below the main cistern. A very important point to bear in mind is that the closets and lavatory basins are often all in use during the same time; therefore, all service-pipes must be exceptionally large. There are so many disadvantages connected with the small flushing cisterns which water companies insist upon, that other methods of flushing the closets are arranged when water is supplied through a meter, such as lead-lined trough and spindle-valves over waterclosets or continuous cistern. The stoneware trough and automatic flushing-tank arrangement for waterclosets partially avoids these difficulties; but a separate watercloset apparatus and flushing arrangement has many advantages over the trough method. Ranges of waterclosets in or adjoining a building should be invariably separated from the corridor or stairs which gives access to them by a well-ventilated lobby or passage, in which may be placed the lavatory basins. These lavatories should be roomy enough to allow pupils to pass freely to and from the waterclosets while others are using the basins. The height of the lavatories and waterclosets need not exceed 8ft. 6in. or 9ft.; a separate window for each watercloset, inlet ventilators near the floor of the lobbies or lavatories, and outlet flues from the ceiling level up to above the roof are desirable.

WALLS.

Walls must, of course, be built of sufficient substance to resist heat, cold, and moisture. Hollow walls in very exposed situations are useful, in spite of their disadvantages; but solid walls of good materials are better for ordinary positions. All openings in walls, flues, chases, &c., should be made accessible for cleaning. The greatest care should be taken, and thoroughly effective means should be adopted to prevent moisture penetrating the walls from above downwards, or from the ground upwards. Solid damp-proof courses, formed of asphalt, slate, cement, &c., ought alone to be used, being much more effective than the various glazed perforated substitutes.

ROOFS.

Roofs, if of the usual wood rafters, and slate, tile, or lead coverings, should be close-boarded, and have some non-conducting material under the outer coverings.

FLOORS.

Floors of classrooms should, if possible, be impermeable, and covered with wood. Where wood

joists are used special care should be taken to insure rigidity, and provide effective means of checking the passage of sound and air through the floors. Floors of all lavatories and science-rooms should be solid, with hard, non-absorbent coverings. The use of porous breeze concrete for such floors is not to be commended. Wood floor coverings should be polished, and have skirting fillets of sufficient width to keep the desks from injuring the wall surfaces.

VENTILATION AND WARMING.

The cost of forming and maintaining a system of mechanical ventilation, and the desire for an open fire for the sake of cheerfulness and prompt control, account for the fact that in most of the schools of the kind under consideration the open fireplace has been utilised. If a school building be designed to allow currents of air to sweep entirely across it during the pupils' absence, and each classroom be provided with two 9in. by 9in. or 14in. by 9in. shafts or flues from the floor to above the roof, with inlets to each at floor and ceiling levels, in addition to a large warm-air grate and suitable windows, it is found in practice that reasonably adequate means for warming and ventilating are thus economically obtained. Their effective use depends greatly, of course, upon the mistresses in charge of the rooms; but it is an exception to find a head-mistress who is not keenly alive to the value of the means afforded and familiar with the use of them. Vertical inlet tubes, deep sill fillets to windows, and the various valve ventilators, are all useful as aids, *when kept clean*; but unless air is warmed before it enters a school, the inlets will remain closed during six months of the year when fires are in use. This fact accounts for the popularity of the various ventilating grates, most of which can be taken to pieces periodically for cleaning, and work best when doors, windows, and ventilators are closed. The assembly-room, corridors, cloakrooms, lavatories, laboratory, entrance lobbies, and stair cases can be more conveniently warmed by hot-water pipes. It should be possible to raise the temperature in the corridors, cloak-rooms, lavatories, &c., to about 50° or 55° during cold weather, for the purpose of preserving a fairly equable temperature inside the building, and protecting the sanitary arrangements and water services from disorganisation by frost. The small pipe medium-pressure apparatus is found very useful for warming schools, on account of the small quantity of liquid used, enabling heat to be produced in less time than with larger pipes. These small pipes, moreover, can be used under skylights and in other positions where the larger pipes could not conveniently be placed. The practice of arranging hot-water pipes in channels below the floor of the spaces to be warmed, with open gratings above them, is unnecessary, wasteful, and dangerous, because of the difficulty of keeping the pipes and channels free from foul matter from boots and floors. Inclosing hot-water coils in ornamental casings is objectionable for the same reason. The last word upon warming and ventilating crowded rooms has not yet been said; the present methods are not perfect. The air in streets is polluted in a manner which it is to be hoped will be regarded with amazement in the near future, when thick clouds of unconsumed fuel, foul exhalations from so-called sewer ventilators at the level of the roadway, and the fibrous filth from wood pavements, are no longer allowed to adulterate the precious air, which ought to enter our houses unsullied by such dangerous and unpleasant companions. At present the windows and doors are often closed, and the air refused admittance, because it cannot enter alone. Air in buildings will always require warming in winter, but it need not require washing and filtering as it does now. The problems met with in endowed schools for girls are very similar to those in high schools, and are solved in much the same way.

A vote of thanks to the lecturer was proposed by Mr. BANISTER F. FLETCHER, seconded by Mr. W. H. SETH-SMITH, and having being supported by Messrs. E. Howley Sim, Louis Jacob, R. Langton Cole, G. Trolley, and the President, was carried by acclamation, and was acknowledged by Mr. OSBORNE SMITH.

Mr. George W. Willcocks, M.I.C.E., held an inquiry at Hove on behalf of the Local Government Board last week, into an application on the part of the urban district council for sanction to borrow £3,500 for works of street improvement.

ART METAL EXHIBITION AT THE ROYAL AQUARIUM, MAY—JUNE, 1898.

THE preparations for this exhibition, which bids fair to be a very attractive one, are progressing favourably. The following gentlemen have already joined the Council:—

Professor Banister Fletcher, F.R.I.B.A., J.P., D.L., &c. (Chairman of the Council).
Maurice B. Adams, Esq., F.R.I.B.A., &c.
W. A. S. Benson, Esq.
G. Purdon Clarke, Esq., C.I.E., F.S.A.
Lewis F. Day, Esq.
George Frampton, Esq., A.R.A.
George C. Haité, Esq.
J. Starkie Gardner, Esq.
E. J. Kibblewhite, Esq., A.S.A.
Seymour Lucas, Esq., A.R.A.
Percy Macquoid, Esq.
Ellis Marsland, Esq., Hon. Sec. Society of Architects.
Sir Wm. Cuthbert Quilter, Bart., M.P.
F. W. Ruck, Esq.
Josiah Ritchie, Esq.
A. W. Smith, Esq., F.R.I.B.A.
Gilbert Wood, Esq., F.R.G.S.
Herbert Winstanley, Esq.
J. W. Wilkinson, Esq.

EDGAR S. SHRUBSOLE
(Organiser of the Exhibition, to whom all communications must be addressed).

A strong sub-committee is arranging a most interesting loan collection, to which it is hoped many of the City Companies and other owners of old metal-work, armour, coins, &c., will contribute liberally. The applications for space in the Trade section are numerous, and a very good show of the leading art metal-workers is certain.

Very useful features of the exhibition will be the Competitions in Design and Handicraft. The designs invited must reach the organiser of the exhibition, Mr. Edgar S. Shrubsole, at the Royal Aquarium, Westminster, by Tuesday, May 3, 1898.

CONDITIONS FOR CONDUCTING THE COMPETITIONS IN DESIGN AND IN HANDICRAFT.

1. Competitors may enter in any one or in all the subjects in Design and in Handicraft: they must pay a nominal entrance fee of One Shilling for each subject, which fee will be returned to them providing they actually compete.
2. All competitors in the Handicraft Competition will have to provide their own tools; and, subject to consent of London County Council and Fire Insurance Offices, forges, coals, and materials will be supplied.
3. No medals will be awarded in any class unless the judges are satisfied as to the merit of the work.
4. The competitors may attend each day to work at the Handicraft Competitions, from 3 to 5 and 7 to 9.30 p.m. from the 1st day of June until the 15th day of June. A record will be kept of the time occupied, and in case of equality of merit, the advantage will be given to the competitor who has done the same quantity of work in the least time.
5. Competitors in the Handicraft Competitions may bring any drawings they themselves may make, and any moulds or templates for use by them in such competitions.
6. All designs must be sent in on or before Tuesday, May 3, 1898. The envelope must bear a distinguishing mark or motto, be accompanied by a sealed envelope having outside the same distinguishing mark or motto, and inside the name and address of the competitor. This envelope will not be opened by the judges until they have made their awards.
7. In all cases the decision of the judges shall be final and absolutely binding upon all parties.
8. The competitors must during the competitions obey the directions of the judges, and of the moderators, and conform to all regulations which may be made by the judges.
9. If, in the opinion of the judges, the time allotted is not sufficient for the work to be completed, they may adjudicate upon the work in its unfinished condition.
10. All handicraft work, after the time allotted for executing the work, and all designs will be exhibited during all the time the exhibition is open.
11. All work and designs which obtain medals or certificates shall remain for future reference and exhibition for a period not exceeding twelve months, with the name and address of the competitor attached.
12. All work done in gold and silver to be absolutely the property of the Royal Aquarium and Summer and Winter Garden Society, Ltd.

SUBJECTS FOR WHICH DESIGNS ARE INVITED.

1. A street lamp-post for electric light; scale 3in. to the foot.
2. A wrought iron open panel, 2ft. 6in. by 1ft. 6in.; scale full size.
3. A weathercock, 7ft. high, on 6in. square lead-covered post; scale 3in. to the foot.
4. Repoussé coal scuttle in copper; scale full size.
5. Pair of wrought iron carriage gates and piers, opening to be 10ft. wide; scale 1½in. to the foot, with necessary details full size.
6. Wrought iron grille, 12in. high by 5in. wide, in solid oak door, with hinges, lock-plate, and knocker; door 4ft. wide and 8ft. high; scale 3in. to the foot. Details full size.
7. Wrought iron ornamental open screen with door in centre, dividing a hall in a residence; the hall 18ft. wide and 12ft. 6in. high; scale 1in. to the foot, with necessary details full size.
8. Wrought-iron or brass casket with enamel panels; its object is to contain the freedom of a City to be given to a General who has served Her Majesty successfully in India; scale full size.
9. Metal end of a coach-pole for a Mayor's State Carriage; the City is a seaport; scale full size.
10. A brass repoussé book-cover; the book is the "Pilgrim's Progress," its size, large quarto; scale full size.

11. A grille, to fill a semicircular arch 10ft. wide; the design is to be executed in wrought iron, and is to contain a central feature; it is suggested that electric light might be incorporated in this feature, but it is not compulsory; scale 3in. to the foot.
12. A lectern in brass or iron, suitable for a parish church; scale 3in. to the foot.
13. Wrought-iron balconette, 4ft. wide, projecting 3ft., and supported by cantilevers; scale 3in. to the foot.
14. Ornamental guard to prevent flower-pots falling into the street from the window-sill; drawing need only show two-thirds in width of the design; scale full size.
15. Cast-iron stove and mantelpiece with overmantel; fire, 14in.; mantel-shelf, 4ft. 6in. long; total height not to exceed 7ft. 6in., including overmantel. Give plan, front elevation, and end elevation; scale 1in. to the foot. Give details, full size of mouldings and enrichments sufficient to illustrate design.
16. A ewer and basin, soap dish and sponge basin; full size.

NOTE.—The method of execution of the drawings is left to the competitor; but the drawings must be practical and workmanlike, such as a craftsman would require. They must be mounted on stout cardboard, or on linen on wooden-framed strainers, with not more than 2in. margin all round. Two or more small drawings may be mounted on one board or strainer.

PRIZES TO BE AWARDED.

There will be one Silver Medal, one Bronze Medal, and a Certificate of Merit for each of the subjects in the Designs Competitions.

There will also be one Silver Medal, one Bronze Medal, and a Certificate of Merit for each of the subjects in the Handicraft Competitions.

SPECIAL MEDALS.

Two Gold Medals will be offered, one in the Designs Competitions, and one in the Handicraft Competitions, irrespective of subject. These medals will only be awarded in the case of special merit, and will be given in lieu of a silver medal.

SUBJECTS FOR WHICH HANDICRAFT COMPETITIONS ARE INVITED.

1. A 1in. square upright standard diagonally placed through bar, with ornamental head.
2. A stanchion head and saddle-bar, bilged.
3. A clean welding of scrolls, not split; the sketch shows it one-eighth full size.
4. Spray, exhibiting husks and covered junctions on each side of the stem.
5. Spray of natural foliage.
6. A panel, 18in. square, of interlaced bars and centre-piece scroll.
7. A plaster filling, alternating scrolls and husks.
8. A hinge with rose and thistle terminations.
9. Ornamental projecting trade sign, with name panel in pierced lettering; wording of name in panel is left to the competitor.
10. Repoussé copper or brass plate, diameter about 12in.
11. Portion of a memorial brass.
12. Repoussé copper or brass finger-plate.
13. A wrought-iron knocker: design left to craftsman.
14. Lead ornamented bossed head for 4in. rainwater pipe, to be made from a sheet of lead: design left to craftsman. The size of the sheet of lead is 5ft. by 4ft.; 8lb. lead.
15. Two lead ears of different design, to secure 4in. by 3in. lead pipe: design left to craftsman. The size of the piece of lead 1ft. square for each ear; 6lb. lead.
16. A panel for a lady's card-case, either pierced, chased, or embossed: design left to craftsman.
17. A pewter cuele (as per sketch). The bowl to be 6in. in diameter. A copy of the original drawing will be lent to competitors.
18. A key-bow in gold, silver, or iron, for a dressing-case: design left to craftsman.

We give illustrations on p. 834 of the designs in the Handicraft Competition, for which the Council is indebted to the kind assistance of Mr. Lewis F. Day, Mr. Maurice B. Adams, and Mr. J. Starkie Gardner. The work done by the handicraft competitors will be performed each day at the exhibition itself from June 1 till June 15, from 3 till 5, and 7 till 9.30 p.m., and will undoubtedly attract many interested spectators.

THE SURVEYORS' INSTITUTION.

AT the ordinary general meeting of this Society, held on Monday evening last, a paper was read by Mr. F. PUNCHARD (Fellow), of Kirkby Lonsdale, on "The Suggested Amendments to the Agricultural Holdings Act, 1883." As is usually the case at the first December meeting, when many country members are brought to London by their interest in the cattle show, the subject selected was, as the title indicates, a purely bucolic one; but Mr. Punchard's paper contained much which could not fail to interest anyone who is concerned, ever so remotely, with the great industry of agriculture. The Royal Commissioners, who have been reporting on the subject, expressed, Mr. Punchard said, a decided opinion that the policy of the three F's in its entirety would be a grave and serious injury to the agricultural community, and that rents had, as a rule, been adjusted to meet existing prices. They suggested that the landlord's consent be no longer necessary to certain improvements to roads, watercourses, to the making of gardens, the planting of orchards or fruit bushes on a

small scale, and some other similar "improvements." It would be an interesting, and perhaps instructive, return if we could have a statement of the cases in which the present provision as to drainage has been put into force, and whether where the statutory notice was given, the work was done by the landlord or the tenant, and (if by the landlord) how long he had received the stipulated interest on his outlay. The vagueness of the word "improving" as applied to roads and watercourses needed qualifying by a provision that the improvements must be of a durable nature—something beyond the mere putting into working order which was implied in the covenants of the lease. The majority of the Commissioners fortunately held that the landlord should still have the controlling hand over the permanent outlay on the estate, for which he would be ultimately responsible, and that he must not be converted into "a mere rent charger, or that medium of security for tenant's outlay," which Mr. Channing vaguely talked of. He was surprised that the Commissioners had not put the laying down of permanent pasture among the improvements as to which the tenant was to have a free hand. A good piece of newly-laid pasture was perhaps the best proof of continuous good farming, while the "accumulative fertility" could not be easily extracted from it without the effects being apparent. He would advocate giving the tenant a free hand in laying it down; but after it had been down for, say, eight or ten years, he would not allow it to be ploughed without the landlord's consent. He believed that the proviso in the Act as to the "inherent capabilities of the soil" had been inoperative; but its retention showed that the landlord had still some rights or property in the natural and varying capabilities of his land. The author next went into the question of compensation for manurial value left at the end of a tenancy, and pointed out that a dishonest tenant could, by the use of chemical stimulants practically exhaust the land as fast as he put artificial fertility into it by the use of purchased feeding stuffs, and this he could do without detection, while at the same time claiming compensation for unexhausted manurial value. He thought home-grown corn fed to cattle should be treated as if it were purchased. The procedure under the Act was subject to several suggested variations. The arbitrators or referees were to be called valuers, and the umpire must be chosen from a list approved by the Board of Agriculture. The simultaneous delivery by landlord and tenant of notices of claim must tell against the tenant, as the landlord would, and in the case of a trusteeship must, put in every possible claim before he knew what the tenant's items of claim were.

A short discussion followed, in which part was taken by Mr. W. Willis Bund, who did not seem to have a very high opinion of some of the persons who set up for agricultural valuers; by Mr. J. W. Kensley, who thought that the less freedom of contract, as between landlord and tenant, was interfered with the better; by Mr. F. J. Smith, Mr. J. Shaw, Mr. D. Watney, and Mr. H. Donne. On the motion of Mr. Albert Buck, the discussion was adjourned.

CARPENTERS' COMPANY'S EXAMINATIONS.

THE annual examination in Building and Sanitary Construction, held by the Carpenters' Company, took place at their hall on December 2nd and 4th. Among the examiners present were Professors Banister Fletcher, F.R.I.B.A.; T. Roger Smith, F.R.I.B.A.; Henry Robinson, M.I.C.E.; and A. Wynter Blyth, Mr. Hampden W. Pratt (President of the Architectural Association), and Mr. W. Shepherd (President of the Institute of Builders).

The number of candidates who sat for the examination was larger than in the previous year. The entries proved that these examinations are valued in the provinces as well as in London.

The names of the successful candidates, arranged in order of merit, are as follows:—

SILVER MEDALS.—Messrs. S. A. Switzer and H. F. Bridel.

Bronze Medals.—Messrs. H. C. Grubb, F. Hartnoll, Mr. Jno. Sanderson, and Jno. Farham.

CERTIFICATES.—Messrs. H. S. Higlett, E. J. Simmons, A. Thomas, H. Herbert, H. T. Hunt, F. Dawkins, Geo. Ellis, J. Landen, E. W. Turner, W. W. Winn, Jas. Nighy, H. Body, R. H. Ellis, and A. S. Henley. (* Equal.)

Mr. Alfred Carter obtained marks entitling him to a Silver Medal, which, as he already holds it, cannot be awarded to him again.

NOTES ON SURVEYING AND LEVELLING.—VIII.

By WALTER TESTER.

AS soon as the straights are pitched and ready for concreting, the surveyor will have to put in a series of sections as close as necessary, with pegs on the foot line, and at the outer edge set with the level, their tops being at the finished surface of the cycle track. As the section of the track is a straight line, the concretor can work between the two pegs with a straight-edge. The junction curves must now be accurately set out, and section lines put in for finishing these portions, and the surveyor is supplied with details, one for the curve leaving the straight, and the other for the curve entering the straight. The curves are to be set out with arcs of circles of diminishing radii, and taking the one leaving the straight, Fig. 6.

The radius of first arc on the 1ft. line	ft. in. Proportions.
1,913 2	1
The radius of second arc on the 1ft. line	
478 3½	½
The radius of third arc on the 1ft. line	
239 1½	¼
The radius of fourth arc on the 1ft. line	
159 5	⅓

This method of setting out the junction curves is the one adopted by M. Forestier, the French engineer, and is really an approximation to an ellipse by means of circular arcs, the advantages over the ellipse being that the lengths of the curves required for the total length of the track can easily be calculated, and also the radial lines serve for the sections for finishing the surface of the track. It should be mentioned that the formula for the length of an ellipse is an exceedingly long one (see Molesworth Pocket-book), and even then is only approximate. On the detail supplied the surveyor has given to him the dimensions along the line of straight produced, and offsets at right angles to the latter to the curve at the points where the radial lines cut, and also the tangential angles at the same points. The particulars all refer to the measurement line 1ft. from the bottom edge on the track, and the lengths of all these curves have been calculated, so that the total length on the 1ft. line will be exactly 1,760ft., or three laps to the mile. The surveyor is required to set out these curves in the best way he can, and he finds at the outset that it is impracticable to produce the line of straight, and measure out the offsets and set out the angles given on the detail, as he will have to work on the track, and the lines run up the bank out of level, and also the men are at work at these points, and will soon disturb his pegs. He, therefore, decides upon a different method—viz., to mark out the radial lines on the football field, as it is now all sunk down on to the level, and his pegs will not be disturbed.

With this object in view, he makes some fresh calculations, adopting a line, A B, on the football field parallel to the line of straight produced, and continuing the offsets given to cut the line A B. Taking the junction curve, leaving the straight, Fig. 6, he obtains three right-angled triangles, each with an angle the same as the tangential angle given at the corresponding points. Lettering these triangles as shown on the plan, Fig. 6, we have—

Triangle C D E.	Triangle F G H.	Triangle J K L.
Angle C 0° 54'	Angle F 3° 36'	Angle J 8° 6'
" D 90 0	" G 90 0	" K 90 0
" E 89 6	" H 86 24	" L 81 54

Angles outside the triangles at—

E.	H.	L.
180° 0'	180° 0'	180° 0'
89 6	86 24	81 54
90° 54'	93° 36'	98° 6'

Length of sides:—

C D	F G	J K
50' 0" less ¼"	50' 0" less 7½"	50' 0" less 2' 1½"
50.0000	50.000	50.00000
.0625	.625	2.13541

$$CD = 49.9375 \quad FG = 49.375 \quad JK = 47.86459$$

Now taking C D E and using the formula for right-angled triangles:—

$$DE = CD \times \tan. 0^\circ 54'$$

$$EC = CD \times \sec. 0^\circ 50'.$$

Using the tables for Tan. and Sec.:—

$$DE = 49.9375 \times .0157093 = 9\frac{1}{2}\text{in.}$$

$$EC = 49.9375 \times 1.0001234 = 49\text{ft. } 11\frac{1}{2}\text{in.}$$

In the triangle F G H:—

$$GH = FG \times \tan. 3^\circ 36'$$

$$HF = FG \times \sec. 3^\circ 36'.$$

$$GH = 49.375 \times .0629147 = 3\text{ft. } 1\frac{1}{2}\text{in.}$$

$$HF = 49.375 \times 1.0019772 = 49\text{ft. } 5\frac{1}{2}\text{in.}$$

In the triangle J K L:—

$$KL = JK \times \tan. 8^\circ 6'$$

$$LJ = JK \times \sec. 8^\circ 6'.$$

$$KL = 47.86459 \times .1423211 = 6\text{ft. } 9\frac{1}{2}\text{in.}$$

$$LJ = 47.86459 \times 1.0100769 = 48\text{ft. } 4\frac{1}{2}\text{in.}$$

The surveyor has now obtained his distances E C, H F, and L J along the radial lines from the points where they cut A B to the curve on the foot-line; he also has the angles which the radial lines make with A B, and he requires the lengths along A B to the points where the radial lines cut, which can be found by deducting D E, G H, and K L from A D, A G, and A K, using the figures.

ft. in.	ft. in.	ft. in.
15 0½	30 0½	44 11½
9½	3 1½	6 9½

$$AE = 14 \text{ 3 } AH = 26 \text{ 11½ } AL = 38 \text{ 2 }$$

The only other calculation required is for intermediate points on the curves between those where the radial lines cut, and they can be worked out by the formulae in Molesworth's Pocket-Book for the segment of a circle.

For example, taking the portion F J, Fig. 6. The length of the straight line between these two points must first be worked out as the hypotenuse of a right-angle triangle having sides.

ft. in.	ft.	ft. in.	ft.
2 1½	2.13541	44 11½	44.97916
less 7½	.62500	less 30 0½	30.05208
	1.51041		14.92708

$$\sqrt{1.51041^2 + 14.92708^2} = 15.0033.$$

Calling this 15ft., then the offset to the curve at point M

$$= \text{Radius of curve} - \sqrt{\text{Radius}^2 - M^2}$$

$$= 239\text{ft. } 1\frac{1}{2}\text{in.} - \sqrt{239\text{ft. } 1\frac{1}{2}\text{in.}^2 - 7.5^2}$$

$$= 239.14533 - \sqrt{239.14533^2 - 7.5^2}$$

$$= .11766 = 1\frac{1}{2}\text{in.}$$

The offset to the curve at any other points, as for instance N and O, can be calculated by the formula:—

$$\text{Offset} = \sqrt{\text{radius}^2 - M^2} - \text{radius} = (\text{radius} - \text{offset at M})$$

$$= \sqrt{239.14533^2 - 3.75^2} - (239.14533 - .11766)$$

$$= 239.116474 - 239.02817 = .08830 = 1\frac{1}{2}\text{in.}$$

The plan, Fig. 7, gives the detail of the junction curve entering the straight, and the surveyor is supplied with particulars, and makes calculations similar to those already explained. The results are given on Fig. 7.

The surveyor now has all the data he requires, and can proceed to put the lines in on the ground. He commences by measuring out the position of point A along the line already marked out, and then with his theodolite sets out A B at right angles. Along A B he measures the requisite lengths to the points E H and L, and in succession places his theodolite at each of these points, and sets out the angles which the radial lines make with A B, retaining each line by a peg with a nail in it, or an iron bar if on the rock, 100ft. towards the centre of the football field, all points being exactly fixed on the lines with the theodolite. The radial lines can be produced towards the track when required, and the lengths E C, H F, and L J measured out accurately; also the intermediate points on the curve can be put in, and as the radial lines serve for the sections of the track, as soon as the pitching is done they must be produced, and the requisite lengths measured out and pegs put in for finishing the cementing, the tops of the pegs being accurately set with the level at the surface of the track. Each of the sections for the junction curves will have to be put in fully; but for the central portions of the ends, where the banking attains the full height, the surveyor will only require to measure out distances from the centre point and put level pegs at the bottom and top edges of the track, as he can have a wooden template made to the section of the track, and it can be fixed in position and level on the pegs at the edges. The track will require to be finished exactly to the levels, screeds being put in the requisite distance apart, and the portions between the screeds being worked with a straight-edge, no sharp angles being allowed, and great care has to be taken to prevent the surface cracking

The technical school at Dewsbury is about to be enlarged at a cost of £3,500.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

THE plan of this fine Hall, which was opened by the Right Hon. A. J. Balfour, M.P., LL.D., Chancellor, on Friday last, is based on the form of the ancient Greek theatre; this form was chosen as best suited for an auditorium, and one likely to insure good acoustic results. The architectural treatment is the same as the rest of the new University buildings—viz., Early Italian Renaissance. The flat side of the semicircle abuts on the medical school on the west, while the principal elevation is directly opposite on the east. Here is situated the main entrance, 30ft. in height and 16ft. in width, flanked on each side by double pilasters, and crowned by a semicircular pediment containing a carved representation of the ceremony of conferring academic degrees: besides this, there are other six entrances

The entrance to the principal staircase, which is placed in the south angle, is from the quadrangle of the University building; this staircase is oblong in form, and is carried on pillars and arches, which are vaulted; its broad, shallow steps are guarded by a balustrade of stone. The groined ceiling is decorated in colour, the main features being a series of coats-of-arms, including those of the restor, Lord Balfour of Burleigh, and the late rector, the Right Hon. J. P. B. Robertson, besides those of the already-mentioned dignitaries of the University which find place on the outside wall. On the mosaic flooring of the landing are panels containing the arms of the donor, the city, and the University. From the first landing of this principal stair access is gained to the reception-rooms set apart for the assembling of the *Senatus Academicus*, distinguished guests, &c. The staircases leading to the galleries are placed in the round projections at the south and north-east angles of the building. Two staircases are placed in each projection, one leading to the first gallery the other to the second, so that the two currents of people going to, and coming from, these parts of the house are kept entirely separate from one another. This plan of double staircases gives much greater facility of entry and exit. From the corridor on the ground floor entry to the hall is gained by five separate doors. The dimensions of the hall are spacious, the internal diameter being 106ft., while the height to the dome light is 90ft.; this gives an ample floor space, and provides abundant room for the placing of two galleries. The area floor is laid with blocks of oak in patterns, and, in order to allow of its being used for other than formal academic functions, the seats on it are of a movable character, only round the circumference are four tiers of fixed fauteuils also in oak. The wall is panelled in oak up to the height of the first gallery. The galleries are placed over the corridor on the ground floor in the space between the outer and inner walls of the hall, the inner wall being opened up to the interior of the hall by means of an arcading of 13 bays, each 13ft. in width, and rising from the floor to the top of the arch, a distance of 48ft., upon columns of red Corsehill stone, supported as far as the balustrade of the first gallery by square-moulded freestone bases, and surmounted by gilded Corinthian capitals. The pews in the galleries are of oak placed on a sloping platform, and the galleries are guarded by an open balustrade of the same material. These balustrades have central panels

those of the lower gallery being filled with appropriate designs carved and gilded. At the wall-head is a carved stone frieze and cornice, above is a coveled clerestory with circular windows 7ft. in diameter, while the whole hall is covered with a dome constructed of steel and panelled with wood. The figure decorations, which form so handsome a feature in the McEwan Hall, were illustrated in the *BUILDING NEWS* for Dec. 11th, 1896, and Jan. 22, 1897. They were the work of Mr. W. M. Palin. In the centre of the dome is a circular light, 22ft. in diameter, which, with the clerestory windows, lights the hall in the daytime. The flat side of the hall, that abutting on the new University buildings, is reserved for the platform, and the arrangements of it are especially designed for University ceremonies, as the hall is primarily for academic purposes. At the back of the platform is a series of stalls constructed of solid oak for the members of the *Senatus Academicus*, University Court, &c., with special seats in front for chancellor, rector, and principal; as, however, if restricted to its original purpose, the hall would only be used two or three times a year, Mr. McEwan expressed a desire that its use should be extended, and that it should, as much as possible, be made available for civic functions and for concerts of a high class. Following up this idea a magnificent organ, probably the finest in Scotland, has been placed in the hall. Considerable difficulty was experienced in arranging for the placing of the organ in a hall which was never intended for one. The construction of the organ was committed to the Hope-Jones Electric Organ Co., and, as the nature of their mechanism admits of the organ being broken up into sections, a position was ultimately contrived for it. The organ gallery, carried on carved oak pillars, projects over the back row of stalls, and the great organ is placed immediately above. Two other sections of the organ are placed high up on each side of the platform recess; all these are inclosed in handsome carved oak cases, gilt and coloured, corresponding to the rest of the woodwork of the hall. A movable orchestra has been constructed, capable of accommodating 300 people. The framework is of light steel, the floor and seats being of wood; it is made so as to fit over the stalls on the platform, and can be taken to pieces easily; and as easily put together again. The hall is lit by electricity. Before arriving at the present arrangement a long series of experiments were made by the architect and the electric engineers, Messrs. King and Co., as to the best method of lighting the hall; the result is considered by all who have seen it to be most satisfactory. A large pendant hangs from the dome, above the cornice; but concealed, is a series of lights round the whole circumference of the hall; these throw a light on the decorations of the dome. The galleries are lighted by placing lamps concealed behind the pillars and the lower beams of the gallery fronts. The result of this concealed disposition of lamps is that the hall is lighted without the eye being distracted by numerous small brilliant points of light from the lamps. The complete design for the hall included a great tower at the north-west angle, rising to a height of 230ft.; the lower part of it only has, as yet, been executed; it has been carried up to the height of the roof of the hall.

The great object of the architect, Dr. Rowand Anderson, in designing the hall, was not to give it the appearance of a hall designed to hold the maximum number of people in a given space, but to give it as much of a monumental character as possible consistent with the requirements of a good auditorium.

NOTES FROM PARIS.

AMONGST the various committees elected to look after and direct the arrangements and installations of the many sections of exhibits at the Exposition of 1900, the one formed to follow the interests of Class 65, that of the decoration of dwellings, is particularly interesting from the manner in which the well-known artists and men of taste have been joined as members by the side of manufacturers and art-workers, in order to avoid, as much as possible, the exclusive features of harshness and dryness so often apparent when exhibitions of this kind are decorated by leaders of industry alone. Messrs. Puvis de Chavannes, Rochegrosse, Roll, Philippe Gille, and L. Gamlon, all well-known painters, are members of this committee, and, in the classes of jewelry and gold and silver work, Roger Miles, Froment Meurice, Benedite, and Boucheron will maintain

the standard of artistic and intellectual qualities, aided by such members of Parisian circles of art and intellect as Messrs. Waldeck Bousseau, Raymond Joincaré, Laybeyrie, Brice, Barrias, Bonnat, Garnier, Claretie, Sirey, Sardou, and Mme. Adam in the other sections.

The two rival art societies, the *Société Nationale des Beaux Arts* and the *Société des Artistes Français*, now that they are unable to hold their annual salons at the Champ de Mars and the Champs Elysées respectively, owing to the pulling down of the buildings for the Exposition of 1900, are sorely put to for places to hold their future salons. It was proposed to hold the salons side by side in the immense hall of the *Galerie des Machines* in the Champ de Mars, but the rivalry between the two societies is such that an arrangement which would make them such near neighbours could not be accepted. The *Société Nationale des Beaux Arts* at length proposed to take over the celebrated *Pavillon Chinois* in the Bois de Boulogne, and so enlarge and arrange the building as to afford an excellent home for the salon of next year. They have, however, met with certain difficulties with the Municipal Council of Paris, to whom the building belongs, and the military authorities, in whose zone of defence it stands, and again a number of members have resigned, M. de Baudot, the well-known rationalist, taking the lead, because the plans for the new building had been intrusted to M. Formigé without duly consulting the members beforehand. In the face of these difficulties and others which would certainly arise, the *Société Nationale* has abandoned the scheme, and the two rival societies have at length consented to instal their salons in the *Galerie des Machines* on the condition that the two exhibitions be strictly divided off, each one to have its special entrance. It is hoped that such close neighbourhood will bring about a reconciliation between the two societies, but their envy and hate of each other is so great that there is little chance of future friendship. The sum of £12,000 has been voted on the funds of the Exposition to defray the expenses of alterations to the Machine Gallery and the installation of the salons. M. de Baudot, who appears to have entirely separated himself from the *Société Nationale*, makes known his intention of organising a special salon for architecture, quite apart from painting and sculpture, and undertaken in a spirit of rationalism, in which the pompous Classic styles will be excluded to the profit of originality and schemes of architecture based on a rational and logical study of the necessities of the present day, and the new materials now at the disposal of the architect for building purposes. This scheme, if put into execution, will certainly produce very interesting results.

The picturesque ruins of the old *Cour des Comptes*, on the Quai d'Orsay, are at last destined to disappear. The final agreement has been passed between the Minister of Finance and the Orleans Railway Company, handing over the ground now occupied by the Palais de la Cour des Comptes to the latter company, for the construction of a railway-station and an hotel, forming the terminus of the Orleans railway. A committee has been formed whose duty it will be to examine the plans and elevations submitted by the company. It will go to the heart of many a Parisian to witness the disappearance of these most picturesque ruins, despite the cruel souvenirs of 1870 which they recall.

A decree has been passed authorising the reconstruction of the *Cour des Comptes* on the ground owned by the State in the Rue Cambon. The estimated cost of the building is £180,000. Another decree, granting the *Pavillon de Maran*, at the Louvre, to the Union Centrale des Arts Decoratifs, for the installation of its interesting museum, was legalised at the same time. It will be remembered that this society had to abandon the Palais de l'Industrie, where its museum was installed, owing to the pulling down of that building.

At the recent annual public meeting of the *Académie des Beaux Arts*, the following awards were made to the students of the *Ecole des Beaux Arts*, winners of the *Prix de Rome* in architecture; Grand *Prix de Rome* to M. Eugene Duquesne (also winner of Leprince and Leclère scholarships), second and third Grand *Prix* to M. Tony Garnier, and M. Arvidson, respectively.

An interesting report has been presented by the secretary to the *Académie des Beaux Arts* on the works sent in by the students of the *Ecole des Beaux Arts* now residing at Rome as winners of

the Grand *Prix*. The report gives special praise to the work of M. Bertone, who has sent in during the past two years some most interesting work. M. Bertone explored during three months the ruins of Palmyre, in the desert of Syria, at five days' distance from Damascus, supporting the excessive fatigue and dangers of such an exploration. This young architect has already sent to Paris a number of large drawings reproducing the most interesting details of the work, and is now working at the complete plans and façades in their actual state and restored; the whole will form a most valuable set of documents. This year the work sent in consisted of the views and details of the temple of Baal Sehamin, which, according to the inscription engraved on one of the columns of the façade, was constructed during the time of Hadrian or at the commencement of the second century of our era. The *Académie* gives every possible encouragement to the young architect, and expresses the desire that he will complete the useful information which he is giving on these ruins, almost unknown to all.

The plans and designs for the building of the Military Exhibition, to be constructed on the banks of the Seine for the Exposition of 1900, have now been sent in by the architects who have taken part in this competition. The jury, whose duty it will be to decide on the design to be accepted, is composed of the General de la Noë and four military officers, together with three representatives of the navy. The artistic military element is represented by M. Edouard Detaille, the well-known painter of battle scenes, and the element of military industry by General Sebert, director of the *Chantiers de la Méditerranée*, complemented by three members of the institute—MM. Baulin, Vaudremer, and Guadet, architects.

M. Guadet, professor at the *Ecole des Beaux Arts*, is preparing the programme of the competition for the University Palace of St. Francisco. The competition, although prepared by a French architect, is to be an international one; the building is to accommodate 5,000 students and cover a surface of 1,250 acres; the architect is to take no account of cost, either of the building or the materials; the style of the palace is left entirely to the competitors, and may be Classic or original. The committee has already got together the sum of 9,000,000dols., but it is hoped to more than double this sum. The programme will shortly be published.

By reason of the large amount of building work now being undertaken at Paris, and the constant discoveries of archaeological interest which are being made during the pulling down of old buildings and the necessary excavations for the new constructions, the Municipal Council has appointed a committee whose special duty will be to supervise all work which may lead to interesting discoveries, and take every possible precaution and care in unearthing and preserving all relics of past times.

The church of the Madeleine, that magnificent work commenced by Vignon and terminated by Havé, under Charles X., is found to be urgently in need of repairs; the immense and greatly-admired columns of the façades are rapidly going to pieces, and the scheme of complete restoration of the affected portions is now before the Municipal Council.

The sinking and filling-in with concrete of the immense caisson on the right bank of the Seine, destined to support one of the abutments of the new bridge, Alexandre III., has now been successfully terminated. The work has occupied nearly two months and a half; the scaffolding is now being taken down for fitting over the caisson on the left bank, in order to commence the work of sinking. The foundations of the larger palace of the Champs Elysées are nearly terminated; a portion of the ground-floor of the building is already some feet above the surface. The basement is constructed of the celebrated hard stone of Souppes, and the portion of the walls up to the level of the first floor is being built of Eurville stone, two excellent building stones which would be greatly appreciated in England. The cost of the masonry work alone will be £200,000, divided between three contractors.

It is proposed to form an interesting addition to the Exposition of 1900 by a reconstitution of the attractions of Versailles under the reign of the Roi Soleil, Louis XIV. The grand canal, the avenues, water basins, and "bosquets" will be restored as much as possible to their original glory, but the sentiment of progress will provide an additional charm—but this is doubtful—to the beauties of the old royal gardens. Electricity

will play an important part in the installations, and the canal, basins, and cascades will be brightly illuminated with electric lamps and coloured luminous fountains, whilst fêtes will be organised on the canal, and the historical "cabarets" or drinking houses will be reconstructed and add to the pleasure of the visitors. All this, however, will seem to many to be a profanation of the calm and majestic beauties and souvenirs of this marvellous dwelling of old-time royalty.

CHIPS.

The city council of Birmingham accepted, on Tuesday, the gift from Mr. Harding of an oil-painting entitled "Charity," by M. Bouguereau, as an addition to the collection in the Corporation Art Gallery.

The Royal Hotel, Prince of Wales'-road and Bank-street, Norwich, has just been rebuilt from designs by Messrs. Edward Boardman and Son, of that city. It is faced with red bricks and Cossey brick dressings. The dining-room, on the ground floor, is 60ft. by 40ft., the hall 40ft. by 30ft., the winter garden 30ft. by 20ft., and the kitchen 40ft. by 26ft. On the first floor are suites of rooms and the the drawing-room. The contractor was Mr. J. Youngs, of Norwich.

A meeting was held at Hadleigh last week with reference to the proposed railway, to be constructed under the Light Railways Act, between Hadleigh and Long Melford. Sir W. C. Quilter, M.P., presided. After considerable discussion, a committee was appointed to draw up a memorandum to be forwarded to the Great Eastern Railway Company, and to arrange for a deputation to wait upon the chairman and directors of the company.

At the last meeting of the Colchester Town Council, the report of the Roads and Drainage Committee referring to the widening of the Maldon-road was adopted, and certain alterations in the accepted plans to the proposed new town-hall were agreed.

The arbitration between Messrs. Watson and Wilson, contractors, and the Manchester Corporation, as to extras in their construction of a portion of the Thirlmere Aqueduct, is approaching the end. On Monday the proceedings before Mr. Harrison Hayter, the arbitrator, were resumed, and Sir John Harwood and Mr. Talbot (the town clerk) were present. The evidence of Mr. F. B. Winsor was continued. It is expected that the evidence will be closed in a few days.

At Eastbourne Police-court, on Monday, C. Peerless Dennis and Co., builders, Terminus-road, were ordered to pay a nominal penalty of 10s. for having commenced the erection of cottages on the Cavendish-place Estate without having given notice to the borough surveyor.

New board schools at Stapleford, designed by Mr. W. H. Higginbotham, of Nottingham, were opened last week. They have cost £3,000, and include a central hall, 61ft. by 25ft., and six classrooms.

The corporation of Derby have decided to appoint Messrs. Bramwell and Harris as engineers for carrying out the sewage scheme. It is proposed to acquire from 70 to 100 acres of land close to Spondon Station, and to discharge the effluent, after precipitation has taken place, into the River Derwent just below Borrowash. The system will cost £100,000 for land and works at Spondon, and £20,000 for alterations to drains and sewers, &c.

New post-office buildings are about to be built at Worthing from plans by Mr. R. Singer Hyde, M.S.A., of that town.

Mr. Joseph Richard Cobb, F.S.A., a leading Mid-Wales antiquary, died at Brecon yesterday, at the age of 75. The deceased took great interest in the restoration of old churches and castles in the Principality.

The Dean and Chapter of Truro have agreed to the proposal that the memorial to the late Archbishop Benson by those who were ordained by him should take the form of a brass in the cathedral. The sub-committee state that a memorandum was found among the Archbishop's papers containing suggestions as to the form which a monument or a brass should take if such were decided upon after his death. It gives directions as to the attire of the figure and the inscriptions to be placed round it. These will be strictly carried out.

At Eton College, on Monday, a portrait of the Rev. Dr. Hornby, the Provost, and formerly headmaster, painted by the Hon. John Collier, was formally presented to the college by the subscribers.

The Haddingtonshire County Council received on Tuesday a report from Messrs. Carfrae and Belfrage, C.E., Edinburgh, dealing with the proposal to convey the sewage of Gullane direct to the Firth of Forth, at a point west of Jova's Neuk. The engineers reported favourably on the scheme, the estimated cost of which is £1,000. A sub-committee was appointed to consider the scheme.

OBITUARY.

WE regret to announce the death of Mr. OCTAVIUS HANSARD, F.R.I.B.A., of Maida-vale Mansions, and 8, Argyll-place, W., aged 71 years. Mr. Hansard, who was somewhat lame, while at Portland-road Station on Friday dropped his walking-stick upon the line, and rashly clambered down on the metals to recover it. Just then a train came in, and before help could be rendered he was crushed beyond recognition. For many years Mr. Hansard had been a prominent member of the Institute, which he joined as an Associate in 1848, becoming a Fellow in 1860; many years since he served on the council, and at one period was one of the most frequent speakers in discussions. He enjoyed a large West-end practice. Amongst his works may be mentioned the buildings erected for Messrs. Marshall and Snellgrove.

THE death is also notified of Mr. WILLIAM STEVENS CROSS, F.S.I., F.R.I.B.A., which took place at his chambers, 2, Craven-street, Strand, on the 1st inst. Mr. Cross, who was in his 75th year, had long practised at the Outer Temple. He had been a Fellow of the Royal Institute of British Architects since 1872, and of the Surveyor's Institution since April, 1872.

MR. JOHN INMAN, builder and contractor, Fishpool, died at his residence, 24, Devon-street, Bury, Lancs., on Tuesday evening, aged 61 years. Mr. Inman had the contract for the joiners' work at the Bury sewage works, and while superintending some operations there in September of last year, to avoid an accident caused by the breaking of a plank, he jumped a depth of about 8ft., alighting rather heavily on his heels. The concussion injured his spinal cord, and from this he had since suffered. The deceased was born at Stockport, but while very young removed to Haslingden, where he served his apprenticeship with Mr. Holden, builder and contractor. From Haslingden he removed to Heywood, and subsequently was employed at Scarborough as foreman joiner for Mr. Archibald Nield, of Bradford, who was carrying out some large contracts at that seaside town. On going to Bury, 25 years ago, Mr. Inman was for six or seven years foreman for Mr. Charles Brierley, contractor, and about eighteen years ago he commenced business on his own account. He erected considerable cottage property, nearly the whole of Fishpool being built by him, and he also built the Parkhills U.M.F.C. School-chapel and Unsworth Primitive Methodist Chapel. Altogether he built some 200 houses in Bury, and at the time of his death was engaged in the erection of property off Manchester-road, near Gegg's garden. He was a Freemason, and was also a member of the Master Builders' Federation.

A Victoria Hall, seated for 300 persons, has just been built at Errol, N.B., from plans by Mr. Alexander Johnstone, of Dundee. The builder was Mr. Robert Goodall, of Errol.

The Birmingham Corporation decided on Tuesday to raise the salary of Mr. Peter Addie, the manager of the improvement schemes for the past two years, from £300 to £350 per annum. At the same meeting important lettings of land in the improvement area, amounting to £2,000 a year, were announced, these including sites for a proposed arcade and a theatre.

The London County Council discussed on Tuesday a report of its Taxation Committee, recommending that a new source of revenue should be created in the form of a direct charge upon the owners of site values, to be termed the "Owner's Tax," and that this new impost commence at the rate of 6d. in the £. An amendment to refer the subject to the consideration of a Royal Commission was supported by Lord Onslow. The discussion was eventually closed and a division taken, when there voted for the amendment, 50; and against it, 53. The first part of the committee's recommendation, affirming the principle, was carried by 55 to 47 votes, and the further consideration of the report was adjourned.

In the Consistorial Court of London on Tuesday, Chancellor Tristram gave judgment in two consolidated suits, "The People's Warden and Others against the Rev. C. J. Fuller," and the Rev. C. J. Fuller and his churchwarden's application for a confirmatory faculty in the case of St. Mark's, Marylebone-road, in which Mr. Fuller had placed a new altar and reredos, a side chapel, four crucifixes, and covered the Lord's Prayer and Ten Commandments with a curtain. The Chancellor, in a long judgment, granted a confirmatory faculty for the new altar, provided the dais was extended to the north end, and for a side chapel, but he ordered the other things complained of to be removed.

Engineering Notes.

CENTRAL LONDON RAILWAY.—Good progress is being made with this undertaking, and so far no unexpected engineering difficulties have occurred. Besides two-thirds of the tunnel work for the lines being already completed, a large portion of the tunnels for the stations, which are to be 21ft. internal diameter, has also been constructed. The excavation has been entirely in the London clay, and there has not been met with any of the wet sand which caused so much annoyance and delay in the Stockwell portion of the South London line. The tunnels going eastward from Chancery-lane have now approached within a short distance of the Holborn Viaduct, and for the absolute safety of that structure the contractors have completed the necessary arrangements to carry the tunnel under the Viaduct and for some distance on either side by means of compressed air; and for that purpose some of the plant used in the construction of the Blackwall Tunnel has been utilised. The shafts at all the stations, with the exception of those at Davies-street (which will be commenced next week, and in connection with which the street is to be widened at its Oxford-street outlet), have been sunk to their full depth, and they will be ready for the erection of the lifts and staircases at a very early date. Electric instead of hydraulic power will be used to work the lifts. The Electric Traction Company are constructing the line. The depot where the engines—which are to be 8,000 H.P.—and the dynamos are to be placed is to be situated about half a mile west of Shepherd's Bush Station. Here electricity will be generated for traction purposes, for lifts, and for lighting the stations and carriages. The contract for the electric equipment has been given to the British Thomson-Houston Company, an offshoot of the General Electric Company of America. The sinking of the shafts and the tunnelling of the railway have been divided into three contracts: that from Shepherd's Bush to the Marble Arch is being executed by Mr. John Price; that from the Marble Arch to Newgate-street by Messrs. Walter Scott and Co.; and that from Newgate-street to the Bank by Mr. George Talbot. The electric lifts are being constructed by the Sprague Elevator Company, of New York. Sir Benjamin Baker is the engineer-in-chief, and the engineer of the Electric Traction Company is Mr. Ferdinand Hudleston.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.—Mr. Herbert Coward delivered his presidential address before this society at the inaugural meeting of the session at the Hotel Victoria, Northumberland-avenue, on Friday evening. He observed that the two principal events of interest to engineers during the past year were the passing of the Workmen's Compensation Bill and the engineers' strike. The former was simply the outcome of the desire of a Government wishing to go one better than the Opposition, and thus obtain the good feeling of a certain class of the community. With regard to the strike, the original question of the eight hours' day had little to do with the point at issue between the contending parties. Present-day employers were suffering from the mistakes of their forefathers, who, in their exalted notions of the claims of capital, caused labour to combine, thus bringing trade-unionism into existence; but most employers, having learned the lesson long since, not only knew that it was the working man's right to receive proper consideration, but had also found that it paid to treat him justly. In conclusion, the president suggested that engineers' draughtsmen should improve their position by combining in an intelligent and moderate manner to form a union or society for themselves—a society that should define the positions or grades of draughtsmen, and fix a minimum rate of wage for each grade. A discussion followed.

PLYMOUTH.—Sir J. Wolfe Barry and Mr. Cuthbert A. Brereton have reported upon the improvement of Plymouth Harbour. Their recommendations comprise: The deepening and widening of the main low-water channel; the construction of deep-water quays; the formation of deep-water wharves in the upper portion of the harbour; the extension of the breakwater at Mount Batten; the construction of a graving dock; a railway extending along the whole length of the proposed wharves; and the deepening of the channel to a depth of 30ft. at

low tides up to a point where the Cattewater narrows. For the remainder of the distance up to Laira Bridge the depth would be 26ft. Between the entrance to Sutton Pool and Cattedon Point 2,200ft. of wharf accommodation is to be provided. In the upper portion of the Cattewater there would be 1,850ft. more of wharf frontage, with a depth of 26ft. at low water. The cost of the whole works contemplated is approximately put by the engineers at £484,000, of which £227,500 is for dredging.

CHIPS.

A wing for the textile classes is being added to the technical school at Batley, at a cost of about £1,600, which will be defrayed by Messrs. Stubble.

At Christ Church, Catshill, near Bromsgrove, on Sunday afternoon, the east window, which has been filled with stained glass, was dedicated. The window comprises three lights, and the design represents "The Resurrection." Mr. J. A. Chatwin, of Birmingham, was the architect of the work, which has been carried out by Messrs. Hardman and Co., Birmingham.

The construction of a road around the Island settlement of Hongkong will mark the fulfilment of a scheme which has long been desired in the colony. The scheme consists of constructing 10½ miles of new road, practically reconstructing 4½ miles and effecting minor improvements in other portions of existing roads, the whole, 23½ miles in length, forming a nearly complete circuit of the island, with the omission of some of its peninsular promontories.

In consequence of the pressure of the letter and newspaper work in the old General Post Office building on the east side of St. Martin's-le-Grand, it has become necessary to take into the Sorting Office the space at present occupied by the public counter. Accommodation has, therefore, been provided for the Public Office on the ground-floor of the Post Office building opposite—i.e., on the west side of St. Martin's-le-Grand. The change was made on Monday, and the sale of stamps, registration of letters, money order, postal order, parcel post, telegraph, and other business is now carried on in the General Post Office, West.

The Lancashire County Council is promoting a Bill to deal with the 22 offices and salaries of the late Mr. William Radford, the roads and bridges surveyor of the county. The total salaries of Mr. Radford reached £1,192, and he enjoyed private practice. It is proposed to include in the Bill power to purchase and maintain other than county bridges, and to contribute to the building of any bridge belonging to any railway, canal, or other company.

Ex-Provost Hugh Ker died at his residence, St. John's-place, Annan, N.B., on Friday, after a brief illness, from pleurisy. Deceased was one of the best-known public men in the county of Dumfries. For about forty years he carried on a large building and contracting business. The deceased entered the town council in 1855. In the following year he was elected a junior magistrate, in which capacity he acted for a few years. He was then elected senior baillie, and in 1886 Mr. Ker was unanimously elected to the provost's chair. Deceased was in his 74th year, and leaves a widow, three sons, and four daughters.

The Tyne Improvement Commissioners are about to carry out certain repairs to the North Pier at Newcastle, involving an outlay of some £300,000. They have decided that this work shall be done by contract, and not departmentally as hitherto. Similar work has previously been done by the commissioners' own men, under the direction of their chief engineer.

At the parish church of St. Day, Cornwall, a new oak pulpit, the work of Messrs. Harry Hems and Sons, of Exeter, was dedicated last week.

One hundred thousand Jarrah sleepers are being shipped at Perth, Western Australia, for the railways of the Orange Free State, under the supervision of the Forestry Department.

At Friday's meeting of the Solihull Board of Guardians a long discussion ensued upon the report of the Workhouse Visiting Committee. In June last the Local Government Board decided that the present workhouse was inadequate for the requirements of the district, and a sub-committee of the Visiting Committee was appointed to consider the matter. They reported that they had consulted Mr. Ward, architect, Birmingham, who had prepared sketch plans for a new workhouse to be erected at an estimated cost of £36,000 or £38,000. The committee recommended that the sketches be forwarded to the Local Government Board, and that a deputation be appointed to meet the Local Government Board and confer with them upon the question. By a majority, however, the board of guardians decided to refer the plans back to the committee for further consideration.

Building Intelligence.

BIRMINGHAM.—A committee of the Birmingham Corporation have found that the stabling accommodation at Edwardes-street yard, which was taken over from the late Balsall Heath Local Board on the annexation of their district to the city in 1891, is altogether inadequate, and the buildings themselves are in such a dilapidated condition as to necessitate their being shored up. The city surveyor, Mr. John Price, has prepared plans, which have been approved by the two departments. These plans provide for stabling for 20 horses, a cottage for the horsekeeper, horsebox, shoeing-shed, harness-room, weighing-machine office, messroom, proper sanitary accommodation, the paving of the yard, and an office for health inspector. The committee have accepted for the work the tender of Mr. Thomas Johnson, of Great Brook-street, at the sum of £3,838.

BRIXTON.—The new Gresham Baptist Chapel, facing Gresham and Barrington-roads, Brixton, has recently been opened. The elevations are in the Italian style of architecture, and are of yellow malm bricks with Portland stone dressings. The building consists of a basement for heating purposes, chapel on the ground floor with entrances from both roads, deacons' and minister's vestries; the seating accommodation is for 475, two entrances and separate staircases to gallery, and also two entrances and staircases to schoolroom, which is placed above the chapel, on either side of which are arranged classrooms for boys, girls, and infants; kitchen, w.c., lavatories, &c. Messrs. Whitehead and Co., of Clapham-road, are the contractors for the general works; Stuart's Granolithic Co. for the fire-resisting floor, and Messrs. Ward and Co. for the staircases. The total cost has been about £5,000. The architect is Mr. J. William Stevens, A.R.I.B.A., of No. 21, New Bridge-street, E.C.

MANSFIELD.—The new church of St. Mark was consecrated last week. Mr. Temple Moore, of Westminster, is the architect, and the contract was let to a local firm of builders, Messrs. Fisher Bros., at £4,720. The external walling is of Mansfield Woodhouse stone, and the roofs are covered with stone slabs and red tiles. The interior consists of a nave and sanctuary under one unbroken roof, with narrow side aisles divided from the body of the church by an arcade of five bays, carried on square piers. The ambulatory is carried round the east end of the sanctuary with the vestries to the east of it. At the west end the nave and side aisles open into a wide western aisle, which runs across the whole width of the building, and into which, at its north and south ends, the outer doorways open. On the north side of the church, outside the ambulatory, is placed a wide aisle, two bays in length, the western part of which is occupied by the morning-chapel, and in the eastern end the organ will be placed. The sanctuary is raised four steps above the level of nave. Behind the altar is the reredos and a carved reredos of oak, above which is placed a representation of the Crucifixion with figures of the Saviour on the Cross, and of St. Mary and St. John. The reredos is Perpendicular in character, with an ornamented setting of Tudor flowers. The pulpit is of oak, with tracery panels, the sounding-board having richly-carved cornice and cresting; the style adopted by the carver is Flamboyant. The floor of the nave is paved with wood blocks, and that of the aisles and sanctuary with Mansfield stone. The details of the interior, which are of a very simple character, follow in manner the 14th-century style.

PETERBOROUGH.—At the annual meeting of the Cathedral Restoration Committee it was reported by the committee that during the year they had empowered the architect, Mr. J. L. Pearson, R.A., to proceed with such underpinning as he might think necessary, and with the restoration of the north-west gable of the west front of the cathedral. These works had been carried out in the most satisfactory manner, in accordance with Mr. Pearson's specification. Those portions of the great arch, and of the gable above it, which were taken down and rebuilt, contained in all 2,006 facing stones. Of these 170 only were found so decayed that they had to be replaced by new ones; the remaining 1836 stones have been put back again into their original positions. It was considered desirable before the scaffolding was removed to carry out the necessary repairs to the pinnacles of the north flanking tower, in-

cluding the rebuilding of the south-east pinnacle, blown over by the gale in March, 1895, to repair the old roof behind the north-west gable, and also to do the works required to render secure the upper part of the gable on the north side of the west front and its two flanking turrets. All these works have been completed, and the scaffolding at the north-west gable has been taken down. The sum of £2,816 8s. 2d. had been expended in repairs and renovation, irrespective of architects' commission, &c. The committee now appealed for £7,500 still required to enable them to complete the works advised by the architect at the south-west and central gables of the west front, and also the necessary repairs to the north transept and eastern chapel. It was unanimously resolved to proceed with the erection of centre supports to the south-west arch.

STRETTON, BURTON-ON-TRENT.—The Bishop of Lichfield consecrated last week a new church which has just been erected at Stretton, Burton-on-Trent, by Mr. Gretton, at a cost of over £30,000. The present edifice occupies a fresh site, and replaces a small, unpretentious parish church. It is cruciform, and has a central tower rising immediately over the choir. Stanton stone is used externally, but the interior walls are of Runcorn stone. The woodwork and the appointments are mainly in oak, and the flooring consists of stone quarries and wooden blocks. A high screen separates the chancel and the south chapel from the nave. It is surmounted by a cross of exceptional size, and, together with the choir stalls, organ-case, and pulpit, has been carried out by Mr. J. E. Knox, of Kennington. The chancel is laid with black and white marble. The roof is embellished with representations of angels playing upon instruments, and singing "Gloria in excelsis." Mr. Charles Powell, of London, was the decorator. The only stained-glass window at present in the church is at the east end, and is the work of Sir William Richmond, having been executed at a cost of £1,000. The subject symbolises our Lord in His Majesty. There is no reredos proper, but a low enrichment of marble and alabaster is situated behind the altar. The stone-carving throughout is by Mr. Bridgman, of Lichfield. The font is raised on three circular steps of Frosley marble, and has a canopy of carved oak, containing, in recesses, eight effigies. The church will accommodate, with pews and chairs, 400 people. The building, which contains an organ by Messrs. Hill and Son, London, has been erected by Mr. Halliday, of Stamford, from the designs of Mr. J. T. Micklethwaite, F.S.A. (Somers Clarke and Micklethwaite), Westminster.

During the past twelve months 2,062 plans were passed by the Leicester Corporation, or nearly 500 more than in the previous year, and this large number does not include alterations and additions.

At a meeting of Berwick-on-Tweed Town Council held on Tuesday, it was agreed, by 11 votes to 9, to invite competition for plans for the new police station and lock-up which are to be built in Church-street at a cost estimated at £3,000 or £4,000. Two prizes of £50 and £25 are to be offered as the first and second prizes for the best plans.

The designs for the new buildings of the college of the City of New York will be selected in limited competition. Messrs. George B. Post; McKim, Mead, and White; R. H. Robertson; Cady, Berg, and See; C. C. Haight; J. R. Thomas; W. B. Tuthill, and George Martin Huss have been invited to compete. The buildings will be situated on 138th-street, not very far from the spot where Alexander Hamilton lived, in which was then an extensive country estate, overlooking the Hudson River, far removed from the noise and bustle of the city.

The trustees of the estate of Mrs. Evans, the owner of Loftly Down-rise, above Ventnor, one spot of which is the highest point of land in the Isle of Wight, have intimated that it is Mrs. Evans's intention to make the town a present of the Downs for the use and recreation of the public for ever. The Downs comprise several hundred acres, and the summit commands a wide range of view over the whole Island and parts of Hampshire and Sussex.

Sir John Blaker, the Mayor of Brighton, presented to the town on Wednesday a marble statue of her Majesty, as a memorial of the Jubilee year. It has been executed by Signor Carlo Niccolo, and is the third statue in replica of her Majesty which has been produced by the same sculptor, one having been already erected at Kurrachee and another at Melbourne. The statue is executed in Ravaccione (Carrara) marble, and stands upon a pedestal of Carrara marble of a darker colour, which has been presented by the Corporation.

SECOND PREMIATED DESIGN FOR THE BURY ART GALLERY AND FREE LIBRARY.

THE authors of this design were Mr. H. A. Cheers, Twickenham, and Mr. Smith, Blackburn. The authors are of opinion that the style of architecture adopted is the most appropriate for this class of building. They consider the art gallery to be of first importance, and have consequently placed the entrance in the centre of the Moss-street front, in accordance with the true spirit of the instructions issued to architects. The authors believe that the entrance thus located gives a more architectural appearance than if placed in any other position. To approach the art gallery, it is necessary to pass through a spacious vestibule, and from thence into a grand staircase and sculpture-hall, from which a massive staircase gives access to the gallery floor. The galleries are arranged *en suite*, and well lighted from the top, and in no case is the wall-line broken by projecting bays, which, in the opinion of the authors, is a most objectionable feature in many galleries. Ladies' and gentlemen's cloak-rooms and conveniences are well placed and retired, at the rear of the grand staircase and sculpture-hall. A curator's room is provided in a mezzanine immediately over the cloakroom and opening on to the grand staircase, from which the curator commands complete supervision. The large picture-lift is conveniently placed at the corner of Back-street, and communicates with basement and gallery floor. The library is approached from Silver-street, the various rooms being well placed and lighted, with ample provision in the basement for the storage of books and pictures. Cost, £16,000.

WELLS CATHEDRAL.*

THIS view, from the Palace grounds, shows the Cathedral at Wells from its best aspect, and exhibits the central tower to the utmost advantage. The etching belongs to a series now in course of publication by Messrs. Frost and Reed, of Bristol, under the title of "The Church Towers of Somersetshire," drawn by Mr. E. Piper, M.R.S.P.E., with a description upon each sub-

ject, written by Mr. J. J. Warden Page, whose well-known book on Exmoor and the hill country of West Somerset stamps him as no mean authority. Among the churches chosen are Axbridge, Bishops Lydeard, Bruton, Chard, Cheddar, Crewkerne, Dunster, Glastonbury (St. John's), Ilminster, Martock, Mells, Norton Fitzwarren, Taunton, St. Cuthbert's Wells, Wrington, &c. There are some 50 plates in all, making a very attractive and valuable series.

ST. MARY'S CHURCH, BOLSOVER, DERBYSHIRE.

THIS church, it may be remembered, was almost entirely destroyed by fire about ten months ago. The only remaining portions of the old building are the early 13th-century tower and spire, portions of the outside walls of the 14th-century chancel, the Cavendish chapel, erected A.D. 1618, and the north porch and parts of the outside walls of the north aisle and transept (used as a vestry), which were built about twenty years ago. The former church provided seats for about 500 adults, and it was desired to increase the accommodation as much as possible, whilst retaining the portions of the old building which were not destroyed by fire, and without adding to the length of the church, and the width only by a lateral extension of the south aisle, by which about 70 more seats are provided, and by the conversion of the north transept into a morning chapel containing 35 seats, and building a new vestry to the east of this. The only other feasible means of providing more accommodation being in a vertical direction, it was proposed to carry the roof in one span over the nave and aisles, and to form triforium galleries above the aisles, approached by staircases at the west end, and giving space for 100 more seats. The accompanying drawing shows this design for the new interior, which was approved by the building committee and the parishioners, the bishop, and other authorities. These triforium galleries have, however, been abandoned in the carrying out of the work, owing partly to considerations of cost and partly to the objections of the Derbyshire Church Extension Society, and a triple roof arrangement over the nave and aisles has been adopted, the nave arcades being carried on octagonal pillars with capitals, as before. With these exceptions the church is being rebuilt as shown. It may be added that the nave has been made 3ft. 6in. wider than the one destroyed, thus being on the central axis between the western tower and the chancel, as the original 13th-century nave evidently was. The interior of the church, as shown in the drawing, was intended to be built of red Mansfield stone, including the lining of the walls, with alternate bands of yellowish-white Mansfield stone in the upper parts above the arcades and in the chancel. Ancaster stone has, however, been substituted on account of cost for the whole of the interior work. The external walls are of Bolsover Moor stone, with Weldon stone for the window tracery, &c. The woodwork for the roof is chiefly pitch-pine, and the doors and seats are to be oak, the whole of the woodwork being stained palm-leaf green. The roofs will be covered with Buttermere green slates. The floors under the seats are to be wood blocks, the passages tiled, and the chancel floor marble paving or mosaic. The builders are Messrs. Bowman and Sons, Stamford, whose contract amounts to £7,776. The total cost of the rebuilding and restoration, including fittings and furniture, will be between £9,000 and £10,000. Mr. Louis Ambler, A.R.I.B.A., 7, Arundel-street, Strand, London, is the architect, and Mr. J. C. Walker, the clerk of works.

"DRISHANE," KENILWORTH.

THIS residence, belonging to Mr. J. F. Scully, is built upon a charming triangular site in the Forest-road, Kenilworth, and commands extensive views across the golf links on one side and of the Castle and Abbey ruins on the other side. The site is well timbered, and on the south side of the house are the Badminton and tennis lawns, with sloping terraces around. Whilst excavating for the building, portions of the old wall that once surrounded Kenilworth were exposed to view. The builder was Mr. R. Bowen, of Leamington and the architect Mr. De Lacy Aherne, of 55, Colmore-row, Birmingham.

At a meeting of the Rivers Committee of the Manchester Corporation on Tuesday, a sub-committee was appointed to consider and report upon plans for the treatment of the sewage of the city. It is intended to take the advice of experts, and to report at as early a date as possible.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

EDINBURGH ARCHITECTURAL SOCIETY.—A meeting of this society was held on Wednesday in last week, Mr. J. A. Williamson, A.R.I.B.A., president, in the chair. Professor Baldwin Brown delivered a lecture entitled, "Notes on Some Edinburgh Buildings and Monuments." He began by explaining that his intention was to touch upon Edinburgh buildings, not from the historical point of view, but only as illustrating matters of general interest to those embracing the profession of architecture. The foremost question of the hour on the artistic side of architecture was that of the meaning and value of architectural styles in modern practice. Many of the younger members of the profession were repudiating the idea of being bound down in their work by the traditions of the past, and were claiming for the designer freedom to work out the solution of modern problems in a modern spirit. The past history of the art, however, showed that the "styles" had not fettered freedom, and that some of the best architects—as, for example, Wren and Playfair—cared comparatively little what forms they used so long as they obtained those effects of grouping at which they aimed. The truth was that architectural effect depended not so much on the forms themselves, but on the designer's sense of proportion in their combination. There was a distinct advantage in the use of well-understood established forms, because the eye was able to judge better of their relations without the attention being drawn off to the forms themselves. The present age had really its own architectural style, and a very good style, brought down from the Tuscan Renaissance and established here by Adam and Playfair. The fact that we had this tradition of style was, however, obscured by the numerous revivals of which the 19th century had been the scene. The lecturer discussed some of these revivals, "Gothic," "Classic," and "Scottish Baronial," in their effect on Edinburgh architecture, and urged architects, if they wished to found a new style, to take the new materials which they used now, iron and steel, and to try and evolve from these materials suitable forms for their treatment.

NORTHERN ARCHITECTURAL ASSOCIATION.—A meeting of this association was held, in the Art Gallery, Newcastle, on Wednesday evening in last week, Mr. Frank Rich, president, in the chair. Mr. John Lane, of York, addressed the assembly on "English Cathedrals," considering their general, but more particularly their picturesque features, as compared with the cathedrals of more Southern climes. Having introduced his subject, the lecturer proceeded to illustrate the details by many lantern pictures.

CHIPS.

A memorial has been placed in Addington Churchyard, Winslow, to the memory of the late Lady Addington. It consists of an ornamented cross in grey granite; there is a marble panel let into the centre of the cross, in the form of a vesica, containing a figure of the Virgin in high relief. The work was executed by Messrs. J. Forsyth, of Finchley-road, Hampstead.

The County-court House, Galway, is being warmed and ventilated by means of Shorland's patent Manchester stoves, with ornamental tiled sides, and with descending smoke-flues, and Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Mr. A. Bowes, A.M.Inst.C.E., M.San.I., of the the borough engineer's office, Salford, has been appointed surveyor to the urban district of Newton-in-Makerfield, out of a large number of applicants.

On Friday last, the Duchess of Albany opened the new school buildings at Uppingham, and unveiled a bust of the Queen. The buildings were designed by Mr. J. G. Jackson, R.A., and erected by Mr. S. J. Halliday, of Stamford. The Duchess at the same time inspected the new workshops, isolation wards, and additions to sanatorium. These buildings have been erected by Messrs. Dorman and Scott and Mr. W. Dean, of Uppingham, under the supervision of Mr. J. B. Corby, F.S.I., architect, Stamford and Uppingham.

The foundation-stone of Richmond Road Congregational Church was laid at Roath, Cardiff, last week. The building will be Late Gothic in style, and will have a tower and spire rising to a total height of 120ft. Messrs. Habershon and Fawcner, of Cardiff, are the architects, and Mr. D. Davies, of the same town, is the contractor. The cost will be about £5,500.

* The following illustrations of Wells Cathedral have appeared in the BUILDING NEWS during recent years. Plan, with details and views, July 20, 1888; plan of Cathedral and of precincts, Aug. 10, 1894; two interior views, by C. E. Mallows, Aug. 17, 1894; west front and N.W. tower, June 12, 1891; interior south transept and entrance to Vicar's Close, by C. E. Mallows, Aug. 10, 1894; Chapter-house entrance, April 10, 1891; bird's-eye view of Vicar's Close from the Cathedral-roof, July 19, 1889; and the Deanery bay windows, Jan. 30, 1886.

SUBJECTS FOR WHICH HANDICRAFT COMPETITIONS ARE INVITED AT THE FO

Correspondence.

WALTHAMSTOW BATHS COMPETITION.

To the Editor of the BUILDING NEWS.

SIR,—I venture to say that the opinion you expressed on this matter was founded on the whole story, and not upon "half a story," as suggested by Messrs. Spalding and Cross. These gentlemen should clear their minds of cant and stick to facts.

The question at issue from a professional point of view is simply this: Are Messrs. Spalding and Cross justified in accepting the appointment as architects to the above, after their plans have been placed second in fair competition (on the award of Mr. Rowland Plumbe), and, further, after the plans placed first have been accepted by the Council—who instituted the competition—and the architect appointed under seal? Is a slight change in the *personnel* of the Council sufficient justification? Messrs. Spalding and Cross say: "That after the award was received from Mr. Plumbe the Council determined to place the work in their hands, but owing to a change made in the *personnel* of the Council, the new Board, which contained a majority of Mr. Dunford's supporters, determined to have his plans adopted." This statement is untrue. The *personnel* of the Council that instituted the competition (August, 1896) and instructed Mr. Plumbe to report (October, 1896), was exactly the same as appointed me their architect (February, 1897). Messrs. S. and C. add: "When we heard that Mr. Dunford was to be intrusted with the work, we did not move in the matter, either directly or indirectly."

Judging by the tone of the attacks made upon me in a local newspaper, to which Mr. Spalding sent a telegram of congratulation on the result of a Parliamentary victory in the Walthamstow Division, and edited by a member of the Council, I am bound to confess I had formed a different opinion. Messrs. Spalding and Cross, of course, mean by this that they did not inspire the following statements:—"That Mr. Dunford belongs to the Society of Architects, a small body, and considered of no importance in the profession," a statement, no doubt, interesting to the 600 architects who form that legally Incorporated Society. "That Messrs. Spalding and Cross have met Mr. Rowland Plumbe in competition and 'knocked him into a cocked hat.'" The classic elegance of the phrase will be appreciated! However, I am glad to have the disclaimer, but it has come none too soon.

Messrs. Spalding and Cross further say, previous to the institution of the competition, "The Council's surveyor sent us a plan of the site and we then prepared a plan of the baths and laid it before the Council." (Not the particular Council that instituted the competition.) "We, therefore, considered we were appointed architects to the baths; but ultimately Mr. Dunford, a local architect, was brought upon the scene."

This statement is decidedly disingenuous. It is evidently intended to lead your readers to believe that in the first instance Messrs. Spalding and Cross were officially approached by the Council. If this is the intention, it is untrue. The manner in which Messrs. Spalding and Cross first came before the Council is a matter of local notoriety.

A member of the Council has publicly stated "that Mr. Spalding called upon him at his house with plans, and he brought the name of the firm before the Works Committee the same evening, and so secured Mr. Spalding an interview."

The *Walthamstow Guardian* says, "According to this very amusing story, which might perhaps pass muster with the marines, a member of a well-known firm of architects without any previous communication called upon one of the rank and file of the Council, who was a complete stranger to him. Further, he was armed with plans, and by a strange coincidence he called on the very evening that the Works Committee were to meet. Truly, a wonderful yarn! Coincidences will happen; but is it customary among architects for a member of a firm to trot about with plans calling upon strangers in the hope of getting an appointment? We should have thought it would have been more business-like to have communicated with the chairman or the clerk."

After pushing themselves before the council, and making a sketch plan at their own expense, one can quite understand that they "considered we were appointed architects to the baths," and that their singularly humane and sensitive spirit

was shocked when they heard a few months afterwards that a competition was to be instituted.

Having carried out the public library ("B.N." illustration, Sept. 28th, 1894) on the adjoining site to the entire satisfaction of the Local Board—a few months previous to Mr. Spalding's interview with the district council—I venture to say, that my claim to be considered in connection with the baths was at the time equal, if not superior, to the claim of Messrs. Spalding and Cross.

I observe that I am referred to as "a local architect." I don't know whether this is meant as a term of reproach or what? I am proud to think that I derive the title by residing in the district, and through my neighbours employing my services in connection with a public library, a church, one of the finest model bakeries in the kingdom, and other works, they know, if Messrs. Spalding and Cross do not, that I have also carried out over £100,000 of work in all parts of the country; that my designs have been carried out in all parts of the world, and that the first time I met Messrs. Spalding and Cross in competition I gained first place in the judgment of one of the most eminent architects of our time. I am quite content to be described "a local architect."

The basis of the competition was an expenditure of £7,000. Mr. Plumbe put the price of my design, after allowing for a sudden rise in the price of materials, at £8,000 (I stated in my report subject to 10 per cent.), and he pointed out that Messrs. Spalding and Cross's design contained nearly 130,000 cube feet more of building than my scheme, which at 6d. a foot brings their price up to £11,250; yet these gentlemen stated in their report it could be done for £7,000! To help them out of a difficulty the present Council has now agreed to an expenditure of £8,500! Will it stop there?

Considering that my appointment has only been rescinded by a majority of one vote (11 to 10), and solely owing to political reasons, I venture to say that Messrs. Spalding and Cross are not justified in accepting the position of architects to these baths.—I am, &c.,

J. WILLIAMS DUNFORD.

100c, Queen Victoria-street, E.C.

RE FIREPROOF CONSTRUCTED BUILDINGS.

SIR,—I have no desire to enter on a discussion nor to dogmatise on the matter; but I would ask your space to ventilate the following suggestions, in the hope that perhaps they will be found of value.

In the first place, I think it should be generally conceded that it is utterly impossible to construct any building that shall be absolutely proof against destruction by fire. You may have all the construction purely of iron, stone, brick, and "fireproof" plaster, but even then you can conceive of such construction being demolished by the demon fire. In this way, suppose a mass of highly combustible stuff, such, for example, as furniture, is stored in a room the walls of which are plastered with fireproof plaster, the floor of such room being of fireproof construction, the ceiling the same, and, in fact, that there is not an atom of combustible material used in the construction of such room. Nevertheless, we can conceive that if the furniture that is stored therein became ignited, that the heat generated by such combustion will be so great as to crack all the plaster from the walls, ceiling, and floor, and this, leaving bare the iron portions of the construction, be great enough to twist and bend the columns, pillars, and girders out of place to such an extent that the building will no longer hold together, but collapse. Metallurgy shows us that, provided the metallurgist can only obtain sufficient heat, he can reduce to the molten state practically all the metals; and if this is so, provided the burning mass generates heat sufficient to melt the metal used in constructing, a fireproof building will soon be reduced from its rigid form to the utter ruin of the building.

So far as the builder's art is concerned, all he can do is to construct a building that shall not readily permit its constructive parts to be destroyed by fire; but, as just foreshadowed, we can conceive of even the most elaborate precautions against combustion being upset by a sufficiency of heat being generated by a burning mass inside such building.

Now as regards fireproof plaster for covering all combustible materials and in the construction of

a building, I should say that an advance on anything at present used would be a plaster that should be vitrifiable by heat—that is, that as it becomes hot its components would probably melt and form a vitrified glaze, like the enamel on china and glazed earthenware. Such a plaster would not so readily be cracked and displaced by heat as many of the so-called fireproof plasters at present in use.

Another suggestion I would venture to make is this. Construct each apartment, lobby, passage, &c., so that the means of at once extinguishing a fire is ready to hand. To do this, I would say that if pipes were fitted round the walls of rooms somewhere in the cornice, that these pipes were perforated with holes, and that they were connected with some appliance or apparatus for forcing water through them; then, on the outbreak of a fire in any room, &c., all that would be necessary would be to set the fire-extinguishing apparatus at work, and at once there would be a stream of water poured into the room from all sides on to the burning mass contained in it. The water should be as ice-cold as possible, so as to quench as much heat of the burning mass as possible, or the water could be impregnated with some fire-quenching fluid, like those used in hand grenades, fire extinguiser, &c.

I have no wish to enter on a discussion, but have set forth the idea, and I hope others more interested in the building world than myself will thresh it out *pro* and *con*. to see what worth there is in it.—I am, &c.,

H. C. STANDAGE.

Erdington, Birmingham, Dec. 4.

TIMBER.

SIR,—May I be allowed to ask your readers the question as to what is the difference between *red deal* and *yellow deal*, or, strictly speaking, *red pine* and *yellow pine* (*Pinus sylvestris*)? Should there be no difference, then why is the term "*yellow deal*" applied almost exclusively to floor-boards in the textbooks?

There still seems to be that confusion amongst architects on this subject (spoken of by Mr. Hurst), and it is not confined to architects alone, but builders, and even carpenters and joiners as well, who are in daily contact with the wood. Here in the South of England how many joiners planing up their deal, or in the North of Scotland dressing their redwood, would, if asked, inform you that it was *pine* they were working—very few indeed. It seems that the Scotch *fir* is really a *pine*, the self-same *Pinus sylvestris* to which, in English specifications, the vague term of *deal* is applied when describing joiners' work; but when describing the same wood in carpentry it is called *fir*, especially when cut out of balk.

I would suggest that architects, builders, &c., when dealing with this class of timber, should universally adopt the term "*Northern pine*," and state whether to be cut from *deals* or *balk*, thus preventing any confusion or misunderstanding on the subject.—I am, &c.,

D. FORBES SMITH.

Colonel A. G. Durnford, R.E., Local Government Board inspector, has held an inquiry at Kingston-on-Thames into the Corporation's application to the Local Government Board for approval to the borrowing of £2,400 for the purposes of art, science, and technical schools.

The contract for the building of the new Bluecoat School at Horsham was signed on Wednesday in last week. Messrs. Langley and Son, of Crawley, are to be the builders, and the cost will be £294,243. The new school is to be finished in three and a half years.

The Leith Town Council decided on Tuesday to increase the salary of Mr. Simpson, burgh assessor and town architect, by £50 a year.

On St. Andrew's Day, a vestry which has been added to St. Andrew's Church, Totteridge, was dedicated by Archdeacon Lawrance. The new building has been erected by subscription to commemorate the sixtieth year of Queen Victoria's reign. Mr. Charles Nicholson is the architect.

The completion of St. Andrew's Church, Willesden, N.W., has just been celebrated. The first section was opened in 1887, and on Wednesday the Bishop of London consecrated the nave and aisles which go to make up the completed church, which now gives accommodation to over 900 persons. The chancel (55ft. long), transept, and one bay of the nave formed the original building, and to this have been added four more bays and the side aisles. The whole is built of red brick with stone dressings, after the 12th-century style. It is designed by Mr. James Brooks.

St Mary's Church, Bolsover, Derbyshire.

GENERAL PLAN

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLII., XLIII., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., LII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

CHRISTMAS DAY.

IN Christmas week this Journal will be published on THURSDAY, December 23, in time for Christmas Day. All Advertisements must, therefore, reach the Office by THREE p.m. on WEDNESDAY, Dec. 22, to secure insertion.

RECEIVED.—N. T. S.—A. A. and Co.—T. W.—B. T. F.—M. G. T. H.—W. S. and Son.—N. F.

"BUILDING NEWS" DESIGNING CLUB.

THIRD LIST OF SUBJECTS.

C.—A Small Public Library for a suburban district, the site being a corner one in a main thoroughfare, with a frontage of 110ft. and a depth of 80ft. The return road is on the left-hand side of the frontage which faces north, and main façade is to be set back 5ft. A porch or bays may project. No rights of light can be obtained on the right hand of the site. The accommodation required is to comprise a large newsroom, a magazine room, a reference room, and a lending library, all on the ground floor. A ladies' room and a boys' room, as may be contrived, and a librarian's room is necessary. Upstairs, a flat for his accommodation is to be provided, befitting an educated man with a limited income and small family. A filing space and workroom for the staff is necessary, and in the basement a heating-chamber, and lavatory, &c., for staff. The problem is to properly appropriate the relative sizes ordinarily required for the respective departments in a library of this class, remembering that ample counter space for the lending library is essential. Style left to the taste of designer. Cost, £5,000. Materials, red brick and stone. Scale, 8ft. to inch for elevations and sections. Plans, 16ft. to the inch. A sketch view wanted.

DRAWINGS RECEIVED.—"The Bowery," "Maggot," "Wen," "Orb," "Bonum Consilium," "Mac," "Eric," "Klondyke," "Inexperienced," "Excelsior," "Spark," "Go," "Pantilo," "Wessex," "Olliwoops," "Hotspur," "Centaur," and "Phantom."

Intercommunication.

QUESTIONS.

[11859].—Retaining Wall.—Shall be glad if some of your able readers could give me the right proportion of wall—i.e., thickness. The wall is to be of concrete, and to be on one or both sides of a street 18ft. wide. The height of necessary retaining wall or walls will vary from about 5ft. to 12ft. The total length of wall is about 700ft. —CONCRETE.

[11860].—Builders' Books.—Could any reader

recommend a good system of builders' bookkeeping, both jobbing and contract work? Something practical, concise, and thorough. Is there any recognised work or treatise published dealing with this?—BOOKIE.

REPLIES.

[11850].—Raising Water.—There can be no difficulty—the pipe can, if desired, be made to follow slope of ground. I should recommend "Student" to consult an engineer who has had some experience in water supplies. —AJAX.

[11852].—Slate Roofs.—The method of laying slates is described in textbooks, such as those published by Longmans, "Advanced Building Construction," and the treatise by Mitchell (Lockwood and Son). Battens are less expensive than boarding.—T. S. T.

[11853].—Fireproofing Iron Columns.—One mode of fireproofing iron stanchions and columns is to inclose them in wire lathing like that of the Expanded Metal Co., particulars of which are given in the prospectus. Asbestos and asbestic may also be used on metal lathing. There are also fireclay or terracotta tiles, perforated, made to surround iron columns; these are often used in America, and are made to allow an air space between the iron column and the tile. The porous clay casing is found to be more fire-resisting. Portland cement plastering on fillets of wood or metal laths is also used; the results are less satisfactory.—G. H. G.

[11853].—Fireproofing Iron Columns.—"A. S. T." will find that cement or concrete is worse than useless for coating iron, as the expansion of the metal, when heated, bursts the covering. A soft yielding covering, such as silicate cotton, which is both fireproof and non-conducting, is the only efficient coating for columns and girders.—H. M.

[11857].—Concrete Flooring.—(1) The rolled steel joists may be placed from 2ft. to, say, 3ft. 6in. apart; but the distance ought to be regulated by the depth of floor and the section of concrete. (2) The concrete can be flat or cambered; in the former case, it may be a slab of, say, 4in. of concrete (Portland cement and furnace slag). If the distance of the joists is greater, wires may be introduced, extending over the top of main girders. (3) The relative merits of concrete in compression and tension depend entirely on the nature and proportions of the cement. (4) The steel joists ought to be protected by fireclay blocks or by wire lathing and asbestic plaster; but porous tile or terracotta is a good, desirable covering. (5) Coke breeze or slag is better than stone for concrete. (6) The method or patented system used as above stated will fix distance of joists. The fireclay blocks in the market protect the ironwork from the action of fire. (7) A good thickness for the concrete arching would be about 6in. to 8in. if the joists were 3ft. apart, including camber. Experiment only can determine the proper depth for certain loads.—G. H. G.

CHIPS.

For the erection of a new hall the city council of Wells have received eight sets of plans in competition from architects.

A new organ was opened at St. Michael's Baptist Chapel, Coventry, on Wednesday night. It cost £600, and has been built by Messrs. Nicholson and Lord, of Walsall.

The Salford Corporation at their last meeting decided to purchase the land lying between Langley road, Agecroft-lane, and the river Irwell, containing about 45 acres, at the price of £600 an acre, for the purposes of a new cemetery.

Mrs. C. Laurie Armitage, of 3, Hall-road, St. John's Wood, who died on the 13th of October last, aged 80 years, the widow of Mr. Edward Armitage, R.A., bequeathed a legacy of £10,000 to the Artists' Royal Benevolent Institution, and many other considerable sums to charitable institutions. A portrait of her husband by Mr. W. W. Ouless, R.A., and a bust of her husband by the late Sir Edgar Boehm, R.A., are left to the Royal Academy.

Mr. Tate has given instructions to the builders Messrs. Higgs and Hill, of Crown Works, South Lambeth, to at once proceed with the work of completing the Gallery of British Art according to the original design of his architect, Mr. Sidney R. J. Smith, F.R.I.B.A. This work, which will take about eighteen months to execute, will considerably more than double the size of the existing building, and give much more space for picture hanging, in addition to which two large rooms will be devoted to sculpture.

Messrs. Fambrini and Daniels, of the Architectural Concrete Works, Lincoln, have supplied the whole of the cornices, strings, heads, cills, &c., for the Cross Keys Hotel, situate at the corner of Upper Ground-street and Blackfriars-road, S.E. This firm have also recently supplied their material for the George and Guy, London, and the Owl, Edmonton, together with dressings for residential flats at Willesden Park, brewery extensions for Messrs. Whitbread and Co., Whitecross-street, London, and tracery windows for Catholic churches at Hull and Beverley. They have secured the contract for upwards of 100 moulded arches, modelled spandrels and pillars, perforated dado, panels, caps, &c., for arading in the premises now being erected for Mr. J. Walsh, of Sheffield. Mr. R. Butson, the firm's sole London representative, has removed from Chancery-lane to 11, 12, and 13, Bridge-chambers, 171, Queen Victoria-street, E.C., where samples and specimens of modelling, and photos of public buildings in their material, may be seen.

LEGAL INTELLIGENCE.

EMPLOYEE FINED BY TRADE UNIONISTS.—The Liverpool County-court Judge, on Tuesday, gave judgment in the case of a master builder who sued the Plasterers' Union for £5, which he had, as he alleged, paid under pressure, as a fine levied by the operatives on him because he offended against the operative plasterers' rules by employing lathers to do the lathing work instead of plasterers, as provided by trade union rules. Until £5 was paid, all plasterers were withdrawn from the shop, and the employer was practically boycotted. The judge held that the payment was voluntary, as by it he got union men in consideration for the money paid. Verdict for the defendants.

The rural district council of Tiverton have adopted plans by Mr. Donald Cameron, city surveyor of Exeter, for carrying out a septic tank system of sewerage and sewage disposal at Thorverton, at an estimated outlay of £1,200.

As a permanent memorial of the Diamond Jubilee, a clock has been erected on Muston Church, near Humanby, Messrs. Wm. Potts and Sons, Leeds, are the makers. It was dedicated by the Ven. J. Palmer, Archdeacon of the East Riding, on Friday.

At the last meeting of the Burnley Town Council it was agreed that the sum of £100 a year paid for the last two years to Mr. Button as consulting engineer be added to the salary of Mr. G. H. Pickles, borough surveyor, as understood at the time of his appointment. It was explained that the salary of Mr. Pickles would now be £350 a year, or £200 a year less than was paid to Mr. Button, the late surveyor, on his resignation.

At a public meeting held at Brechin, N.B., on Thursday in last week, the proposal to raise funds for the restoration of the ancient cathedral was adopted, and a representative restoration committee was appointed.

A new house in Holburn-street, Aberdeen, which had just been completed by the contractor, fell inwards on Saturday afternoon. Two of the masons employed upon it, Charles Birnie and William Ritchie, sustained injuries from which they died, and other four were dangerously hurt. The contractor's son, Thomas Beattie, is suffering from concussion of the brain. It is believed that the fall occurred through the action of the weather. There had been a pretty severe frost, and a thaw set in, which had the effect of softening the mortar.

A new dispensary in Maingo-road, Mill-lane, Westminster, was opened on Friday. The building is of red brick, with freestone dressings and Broseley tiled roof, and has cost £1,550. Mr. W. V. Gough, of Bristol, is the architect.

The fourth of the series of fortnightly lectures in the Glasgow Corporation Art Galleries on art subjects was delivered on Saturday evening by the Rev. John Hunter, D.D., of Trinity Congregational Church, whose subject was Tennyson's "Palace of Art." The lecturer said that Tennyson's great poem was a study of the deeper and larger movements of the intellectual, social, and religious life of the age. After an analysis of the poem, Dr. Hunter showed how it was the tendency of much of our devotion to knowledge, music, and art, to produce just such a type of character as Tennyson had idealised in his "Palace of Art"—a tendency which had been rightly named the new Paganism.

The Vale of Glamorgan Railway line, connecting Barry Docks with the mid-Glamorgan coalfields, was opened for both passenger and mineral traffic on Friday. The line, which is 18½ miles long, forms a means of communication between a vast agricultural district and Cardiff, Barry, and Bridgend.

A fatal accident occurred on the premises of Messrs. Lowe and Sons, contractors, of Burton-on-Trent, on Saturday. A large crane running on an elevated tramway was being used in the usual way on that morning to convey a block of stone, weighing about six tons, to the sheds where the masons were working. The whole structure collapsed and fell to the ground. One of the four men above, William Bowers, leaped from the crane to the ground, a distance of 20ft., but the other three—James Roe, George Whetton, and George Peach—were buried amongst the debris. Whetton and Peach were extricated alive, but seriously injured. Roe was shockingly hurt, and died in the infirmary the same evening. The other two men are progressing favourably.

The sanitary committee of the Bristol City Council have unanimously agreed to recommend the abolition of all fees payable on plans for new buildings and alterations.

The Duchess of Albany opened, on Friday, the new Victoria School buildings at Uppingham, erected from designs by Mr. T. G. Jackson, R.A., at a cost of £9,200, and unveiled a bust of the Queen by Signor Lucchesi, the gift of Mr. W. F. Rawnsley, an old Uppingham boy, and present tutor of the young Duke of Albany.

WATER SUPPLY AND SANITARY MATTERS.

LONDON WATER COMMISSION.—At the adjourned sitting of this Royal Commission, held on Monday, Mr. H. L. Cripps Parliamentary agent for the London County Council (and previously acting in the same capacity for its predecessor, the Metropolitan Board of Works) was further examined on the London Water Supply. He said he believed that the purchase of the present water companies' interests would finally settle the question; that there would be great advantage in dealing with the whole of London as one area; and that by this means they would get rid of the unfair anomaly by which people in one district paid much less for water than those in another. He further believed that if the local authority acquired the water supply, there would be a reduction in the price. The Commission adjourned till Monday next.

CHIPS.

The rural district council for Truro elected Mr. James Paul Carbis as surveyor for the southern district, at a salary of £145 a year.

In the church of St. Nicholas at Kiddington a Jubilee chancel-screen, of carved oak, has been dedicated by the Bishop of Reading. It is perpendicular in style, and has been executed by Messrs. Harry Hems and Son, of Exeter.

At the badly-managed bicentenary service for Freemasons, held at St. Paul's Cathedral on Thursday in last week, a statement was circulated setting out the works for decorating the cathedral which have already been completed, under the superintendence of Mr. F. C. Penrose, Messrs. Bodley and Garner, and Sir William Richmond; and referring to the works in course of construction, and to those which are wanted "immediately" and "in the future." The sum already expended on the decorations is £120,000, and the estimate for the rest of the work is about £100,000, "to be spread over many years, as money comes in." To this amount Thursday's collection—£809—will be given, and some definite panel or portion will be assigned by Sir William Richmond and the decoration committee to the Freemasons.

Notice is given of a Bill to incorporate a Company for the purpose of constructing an underground railway extending from New Cross-road, under the Old Kent-road, New Kent-road, and the Waterloo-road.

The Birkenhead Town Council, on Wednesday, approved the scheme for erecting a new pier, bridge, and stage at Rock Ferry, at an estimated cost of £15,000, and for providing two new screw steamers for the Woodside Ferry.

An area of 28½ acres of land at Brentwood has been purchased by the Metropolitan Asylums Board as a site for an ophthalmic school.

The sewerage works for Bury, Lancs, in the suburbs of Botany Bay, will be formally opened by the Mayor (Alderman Healey) on Saturday in next week, the 18th inst., when he will be presented by Mr. James Diggle, the engineer, with a gold key with which to open the door.

A special service was held at All Saints' Church, Hastings, when Archdeacon Sutton dedicated a stained-glass window. The subject of the window is our Lord in the Temple with the Doctors, the Virgin Mary and Joseph standing before him. In the tracery at the top of the window are the arms of Marlborough College and of Jesus College, Cambridge. The window was designed and executed by Messrs. Powell, Whitefriars.

The trustees under the Birmingham Churches Act have sold the site and building of Christ Church in that city to the trustees of the Colmore Estate for £65,000. The church, which is in the centre of the city near the town-hall, is one which is regarded as no longer necessary, and the final services there were held on Sunday in last week.

Notice has been given to the Hull Corporation to terminate their tenancy of a stoneyard adjoining the Paragon Station at Hull, rented from the North-Eastern Railway Company. The company require the land for the enlargement of Paragon Station.

New Baptist Sunday Schools in Mint-street, Lincoln, were opened last week. On the ground-floor are two shops, each 18ft. by 24ft., with warehouses behind. Space in the rear is utilised for storeroom and engine-room. A flight of stairs leads to the school-rooms on the first floor. The lecture-hall is 85ft. by 28ft., and adjoining are classrooms, the infant schoolroom accommodating fifty children, and the minister's vestry. The choir vestry, at the rear of the chapel organ-loft, is reached by another flight of stairs, and on this floor are four other classrooms. The chapel has undergone improvements, and it has been cleaned and redecorated. Messrs. Mortimer and Son were the architects of the new buildings, and Messrs. Wright and Son were the contractors, the total cost of the work being £2,300.

Our Office Table.

THE Fire Brigade Committee of the London County Council report an instance in which the operations of the Works Department have resulted in a large saving. The Council authorised the execution by the department of some repairs, painting, and drainage work required at the Rotherhithe Fire Station, the architect's estimate being respectively £490 and £148, making a total of £638. The revised estimate of the work amounted to £658; but the actual cost has been £489, a saving of about 25 per cent. on the revised estimate. The manager of the department gives the following explanation of the saving:—"I attribute the greater part of this saving to the improvement in the organisation of the Works Department and the closer attention now given to detail in carrying out the work. Greater care is observed in collecting materials together before commencing the work, and advantage is taken of any circumstances by which a saving may be effected. In the present case the materials were collected in the yard and barged to the job instead of carting in small lots. We were able to save also by reason of having other work proceeding at the same time in the neighbourhood, and, further, were not interrupted by arrangements necessary for the convenience of the fire brigade as is generally the case. There were other circumstances which helped to increase the saving, and which we cannot expect always to find in other works."

MR. PATON, curator of Glasgow Corporation Art Galleries, delivered, at these galleries on Tuesday night, the sixth of his series of addresses on Italian art, his subject being Raphael. Mr. Paton alluded to the general rise, culmination, and decline of schools, which in their early days were dominated by ideas and imagination beyond the artist's power of expression and technical control. At their culmination, conception and execution went hand in hand, and in their decline executive power was in excess of inspiration. In the Florentine school the culmination came in the persons of Leonardo, Michel Angelo, Correggio, and Raphael. Raphael had been called the Archangel of Art. His very perfection was an obstacle to the full appreciation of and sympathy with his marvellous endowments. His ideals were lofty, serene, joyous, and almost divinely perfect, like the grand ideals of Classical sculpture. He had a wonderful faculty of sympathetic appreciation, observed all, learned from all, and improved on all. The conditions of his birth, nurture, education, and surroundings were singularly favourable. His father was a distinguished artist and a poet of no mean ability: while the Court of Duke Federigo of Urbino was notable for its devotion to learning, art, and manly exercises. Raphael's great endowments were developed with untiring patient study and industry from his childhood to the last day of his brief life of exactly thirty-seven years. The lecturer afterwards dwelt on the three separate periods of Raphael's artistic activity, in Perugia, Florence, and Rome.

The Congress of Archaeological Societies, of which Mr. Ralph Nevill, F.S.A., F.R.I.B.A., 13, Addison-crescent, Kensington, is the hon. secretary, is anxious to draw the attention of all municipal corporations and county councils to the extreme importance and value, not only for local but also for general historical purposes, of all such old documents as are now in, or may come into, their possession. The value applies not only to charters and list of freemen or burgesses, but to all manner of ancient documents, such as enclosure maps, leases, and other conveyances, the account rolls and books of treasurers, chamberlains, and other officers, leet and court rolls, and papers relating to lawsuits, &c., and also all county papers, which, before the Local Government Act, 1888, were in the custody of the Lord Lieutenants of the counties, and include the Quarter Sessions records, and papers directed by Act of Parliament to be kept by the Clerks of the Peace. It is impossible to foresee what important bearing such documents may not have upon general history, and this has in the last few years been very generally understood, and many corporations have not only carefully calendared all the old documents in their possession, but in some cases have printed, or are printing, the results. The attention thus given to the matter has brought to light many ancient documents the existence of which was unsuspected. The con-

gress prays all corporations to have a diligent search made for all documents that may belong to them, and to have them calendared and placed in safety in some public office, or at least in their own fireproof safes. It also suggests that inquiries should be made for any old maces, staves, seals, and other badges of office not now in use that may be in existence, so that they may be preserved.

The City Council of Liverpool have discussed at considerable length the conditions of appointment of a new city engineer and surveyor in succession to Mr. H. Percy Boulnois, who has recently resigned the office after eight years' service. The duties are to be modified by the removal to another officer of the responsibilities attaching to the watching of building plans, so as to set the surveyor more free to attend to the roads and streets, and other matters. The Health Committee proposed to invite applications, and to offer an initial salary of £1,000 a year. To this Sir Arthur B. Forwood moved as an amendment that the salary be £1,500 a year, and that the appointment be placed in the hands of a special committee, but the amendment was rejected by the decisive majority of 58 votes to 7. It was urged that the suggested salary was quite inadequate to attract men of the first rank, and a further amendment was proposed, raising the amount from £1,000 to £1,200. It was defeated by 30 votes to 29, it being pointed out that the last time the position was vacant it was advertised at £850 a year, when there were 42 applicants, many of whom were quite competent to fill the vacancy. At this stage the Council adjourned for a fortnight, the proceedings of the Health Committee having not been confirmed.

UNDER the Public Health (London) Act, 1891, every sanitary authority is required to make and enforce such by-laws as may be requisite for the regulation and registration of houses let in lodgings. The by-laws are to provide, among other things, for fixing the number of persons who may occupy a house or a part of a house which is let in lodgings or occupied by members of more than one family, and for the separation of the sexes in a house so let or occupied, for enforcing drainage and promoting cleanliness and ventilation, and for taking precautions in case of any infectious disease. The medical officer to the London County Council has, under instruction, been recently making an inspection to see how far this portion of the Act is being observed in the various London districts. A report which he has presented to the Public Health Committee of the Council shows that in 31 districts the number of houses on the register ranges between six in Plumstead, and 1,500 in Kensington. In Bethnal-green, Lambeth, Lee, Paddington, Newington, Poplar, St. Saviour (Southwark), Stoke Newington, Battersea, and Chelsea, no houses were regulated at the time of the inquiry. In Lambeth the by-laws have recently been confirmed. In Paddington an inspector has lately been employed to deal with the subject. The committee report that in all cases but one in which by-laws had been made and confirmed 400c.ft. per adult person were required in rooms occupied by day and night; but in Clerkenwell, the exception referred to, the amount was 350. That was to be regretted, and they proposed to call the attention of the Local Government Board to the matter. In view of the fact that the statutory requirement that the by-laws relating to houses let in lodgings should be enforced was still so much neglected in many districts in London, they thought the Council should now make a complaint to the Local Government Board. The sanitary authority with regard to which they thought that course should in the first instance be taken was Bethnal Green, as that authority did not seem to have attempted to take any action with regard to houses let in lodgings.

The *Birmingham Post* animadvert upon the recent enforcement in that city of regulations relating to the lighting of basements by the insertion of glass slabs in the pavement, which regulations, it is complained, are a serious curtailment of the privileges which property-owners have hitherto enjoyed. Prior to the retirement of Mr. W. Till from the office of city surveyor the rule was to allow pavement-lights a foot wide along two-thirds of the frontages where they were desired, the corporation exacting no payment and making no special conditions. The result has been that a very large number of business premises in Birmingham have been so planned as to admit of the use of basements for offices, show-

rooms, and so forth, the value of the property being thereby considerably enhanced, and the rates being proportionately enriched. Some time ago it was intimated to persons who were about to erect properties on these lines that the pavement-lights would only be sanctioned subject to payment of 5s. per annum for each light of 6ft. by 2ft., the arrangement to be terminable at three months' notice. Agreements to this effect were entered into in some cases; but other persons concerned have taken the view that not only is the exaction of a rental for the use of a pavement-light illegal, but that the reservation as to the continuance of the light seriously vitiates the property-owner's title, rendering the leasing of basements so precarious as to leave no alternative but to revert to the primitive cellar or comparatively dark storeroom. Apart altogether from the depreciation in the value of the property to the extent of the charge now imposed, many building-owners do not consider themselves justified in going to the expense of constructing basements, and entering into leases with tenants for their occupation, if they are under liability to forfeit their pavement-lights at the caprice of another surveyor or a newly-constituted public works committee. Building-owners have, of course, the option of setting back their frontages so as to allow of the areas being constructed on their own land, but this would not only involve the sacrifice of a portion of the site, but might lead to many irregularities in the building-line. The city surveyor (Mr. John Price) states that the regulation has been adopted in order that the corporation may receive an equitable return for expense to which they are put in connection with pavement-lights, and also with a view to preserving the rights of the public in regard to the footpaths and the space beneath them. The new arrangement is in some respects only tentative, and it is not improbable that it will be modified if it appears to the committee to operate oppressively where properties with extensive frontages are concerned.

THE Canadian Government decided last month on a change of policy regarding timber regulations applicable to the North-West and Manitoba. Timber reserves will be maintained. With this object in view the heavier timber belts will be withdrawn from settlement and the young trees will be preserved so as to foster a growth for the future. Guardians will be appointed to protect the reserves, particularly in the Turtle and Moose Mountain regions. Fires will be prevented as far as possible, and the settlers will be restrained from cutting young trees. Another step in contemplation is the devotion of labour and money toward the laying out of an effective fireguard. A fund for this object was voted at the last Session of Parliament. At the summit of the reserves mentioned are numerous lakes. These are to be connected by wide roads, which, when completed, will form an effective barrier to the progress of fire, it is thought. The theory is that the open spaces and the lakes will constitute an efficient firebreak.

On Saturday night Mr. Harry Hems celebrated the 31st anniversary of his finding of the lucky horseshoe and first arrival in Exeter by preparing a hot supper at his studio in Longbrook-street, of which 82 of his staff and a few personal friends partook. One of the large studios was converted, for the nonce, into a baronial banqueting hall, a large 15th-century oak screen now being restored, standing at the further end, adding to the effect. It was here a string band discoursed music, whilst in the intervals between Mrs. George Packham (*née* Hems), the Misses Hems, and Mr. A. Stevenz presided at the piano. Messrs. Hiscox and Tyndal White also gave solos on the violin and the cello. Before the toasts commenced, Mr. Frank Dyer, as senior employé, made on behalf of his fellow-workmen an apparently unexpected presentation to Messrs. Harry Hems and Sons as a small testimony of the high opinion they held for father and sons. The gift took the form of some beautiful antique silver. Mr. Harry Hems, supported by Councillors Orchard and Sidney Herbert, occupied the chair, and Mr. Greville C. Hems was in the vice-chair. After the loyal toasts, on the proposition of the chairman, the honoured memory of Stephen Shute, John Churchill, Mark Brock, Tom Cunningham, and William A. Lee, former workmen, was drunk in solemn silence. Councillor Sidney Herbert then proposed the toast of the evening, "Continued success and long life to Harry Hems and his sons." The toast was drunk enthusiastically with musical

honours. Mr. Harry Hems, in his reply, said since he came to Exeter 31 years ago that day, he had spent a quarter of a million of money in connection with his business. He was glad to think that during the past twelve months since they last met under similar circumstances he had never said a single unkind word to one of them. Messrs. Greville C. and Harry T. Hems having also suitably responded, music and conviviality became the order of the evening.

AN exposition of Pearson's Automatic Fire-alarm and Heat Indicator was given at the Charing Cross Hotel on Monday. The apparatus is undoubtedly a useful one. It gives instant indication of any dangerous rise in the temperature of any place by closing an electric circuit and ringing an alarm-bell at any place. At present West Ham and other outlying suburbs only are in position to take full advantage of such a system, owing to the high charges of the National Telephone Company; but if the telephone service were municipalised, as it ought to be, and if fire insurance companies reduced their premiums proportionately, as they should do for buildings thus protected, there should be practically no limit to the adoption of this extremely ingenious and inexpensive apparatus.

"PETRIFITE, LIMITED," which is launched this week with a capital of £300,000, is formed to work a new cement, which we noticed some time back, and which was again described in a paper read before the Architectural Association by Mr. H. D. Searles-Wood, which we gave on p. 680 in our issue of Nov. 12. Petrifite is composed principally of magnesite, and it has the property of binding together almost any kind of waste material, such as slate-dust, sea-sand, slag, &c., into useful building blocks.

CHIPS.

The new system of sewerage at Sidmouth was opened on Wednesday. The plan adopted was prepared by Mr. James Mansergh, and under it all the lower parts of the town have been re-sewered.

The Metropolitan Asylums Board have approved of plans of alterations and additions to the convalescent home at Leavesden Asylum for the purpose of enlarging the building for use as an isolation hospital.

Sir George Newnes, Bart., has intimated his intention of presenting his native town of Matlock with the undertaking of the Matlock Cable Tramway Company, Limited. The property is valued at £20,000, and this unique tramway connects Matlock Bridge with Matlock Bank, up a precipitous hill.

The death is reported from Morecambe of Mr. A. Baxter after a lingering illness. The deceased was sixty-two years of age, and was for fifteen years a member of the old Morecambe Burial Board. He carried on a successful joinery business in Union-street, in that town.

On Thursday afternoon in last week the science buildings, which have been erected on the grounds of the Wolverhampton Grammar School, were opened. The cost of the new structure has been £2,000. The buildings are two stories in height, and the accommodation includes a lecture-room, a preparation-room, a storeroom, and a balance-room on the ground-floor; and on the first floor are a chemical laboratory and a physical laboratory. Mr. H. Willcock was the builder, and Mr. G. H. Stanger the architect.

No less a sum than £200,548 was registered at the Estate Exchange last week as the results of the sales held at the Mart; and, in addition to this, a sale of City-road freeholds and New River shares was held by Messrs. Edwin Fox and Bousfield, bringing the gross aggregate to nearly a quarter of a million. There was no lack of demand for investments in house property; and, as has been the case for the greater part of the year, prices were very firm.

Dr. Tristram, Q.C., Chancellor of the Diocese of Canterbury, held a sitting in the parish church of Chiddingstone, near Penshurst, on Saturday, to hear an application for a faculty to authorise the removal of all the fittings in the church and monumental slabs in the pavements (but ultimately to restore and, in many respects, to alter the same), so as to lay down a cement concrete flooring, and for removing, if necessary, bodies interred within the church, and to re-inter them in the churchyard. The architect, Mr. M. E. Macartney, was examined, as well as the rector and churchwardens. The Chancellor decreed that no bodies are to be removed from their resting-places, and gave directions as to reverently covering over all graves, and as to the final restoration of the church. He also decreed the faculty to issue. The alterations and improvements will cost £800.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institute of British Architects. "Report on the Third Series of Experiments on Brickwork," by W. C. Street and Max. Clarke. 8 p.m.
Society of Arts. "Guttapercha," Cantor Lecture No. 3, by Dr. Eugene F. A. Obach. 8 p.m.
Society of Engineers. Annual General Meeting and Dinner.
Bristol Society of Architects. "A Visit to a Cistercian Monastery," by G. H. Oatley. 8 p.m.
Leeds and Yorkshire Architectural Society. "Some Byzantine Churches in Greece," by S. D. Kitson. 7.30 p.m.

TUESDAY.—Institution of Civil Engineers. "The Great Land Slides on the Canadian Pacific Railway in British Columbia," by Robert B. Stanton. 8 p.m.

WEDNESDAY.—St. Paul's Ecclesiological Society. Exhibition of Objects of Ecclesiological Interest. 7.30 p.m.
Society of Arts. "Purification of Sewage by Bacteria," by Samuel Rideal, D.Sc. 8 p.m.
Distribution of Prizes to students of the Trades Training School, &c., by Sir J. Wolfe Barry, K.C.B., at Carpenters' Hall. 8.30 p.m.
Edinburgh Architectural Society. "Normandy," by J. Forbes. 8 p.m.

THURSDAY.—Society of Architects. Discussion on "The Lessons of the Late London Fire," St. James's Hall Piccadilly. 8 p.m.

FRIDAY.—Architectural Association. "House Decoration," by L. A. Shuffrey. 7.30 p.m.

THE ARCHITECTURAL ASSOCIATION.
DECEMBER 17th, ORDINARY GENERAL MEETING, at No. 9, Conduit-street, W., 7.30 p.m. Paper by Mr. L. A. SHUFFREY, on "HOUSE DECORATION."

E. HOWLEY SIM, } Hon. Secs.
G. B. CARVILL, }

The Society of Architects.

Founded 1884. Incorporated 1893.

THE SECOND ORDINARY MEETING of the Society of Architects for the Session 1897-98 will be held at the Rooms of the Society, at St. James's Hall, Piccadilly, W., on THURSDAY, December 16th, 1897, at Eight o'clock p.m., when a DISCUSSION will take place on "THE LESSONS OF THE LATE LONDON FIRE." At this meeting smoking will be permitted.

ELLIS MARSLAND, Hon. Sec.
MONTAGU BALDWIN, M.A., Sec.

Trade News.

WAGES MOVEMENTS.

LIVERPOOL.—A memorial has been forwarded by the Liverpool Operative House Painters' Society to the master painters of Liverpool and district, in which they state: "Having only had an advance of 1d. per hour since 1874, and other branches of the building trade 1d. and 1½d. during that period, we request your consideration of the following alteration of Rule 3: Wages shall be paid by the hour all the year round, at the rate of 9d. per hour. This and other alterations to come into force on May 1, 1898."

A steam laundry and other additions are about to be made to the workhouse at York, at a cost of about £5,000.

A new industry—brickmaking—is being started near Wisbech. Arrangements have been made for the purchase of 125 acres of freehold land about four miles from Wisbech adjoining the Midland and G.N. Joint Railway on the south side and the Sea Dyke-road on the north side.

Owing to the favourable season, it has been possible to push the works of the electric mountain railway from Zermatt to Gorner-grat, which has gradients up to 25 per cent., so as to enable an official trial trip of the electric locomotives being performed before the winter sets in. The electrical equipment of the line has been supplied by Messrs. Brown, Boveri, and Co., of Baden, Switzerland, and marks an advance in the direct application of three-phase currents—viz., without rotary transformation to continuous current.

The committee appointed by the Board of Trade to inquire into the system of ventilation of tunnels on the Metropolitan Railway in their report conclude that by far the most satisfactory mode of dealing with the ventilation of the tunnels would be by the adoption of electric traction. The committee consider the ventilation of the tunnels by means of fans would be practicable; but state that, in view of the probable adoption of electric traction in the near future, it can hardly be expected that the company would incur the expense of at once providing artificial ventilation, and that if they did it would probably defer the more satisfactory solution of the question.

LIST OF COMPETITIONS OPEN.

Hackney—Electric Lighting Scheme	Geo. Grocott, Vestry Clerk, Town Hall, Hackney	Dec. 14
Westminster—Block of Dwellings, Millbank Prison Site	T. Bell, Clerk, Spring-gardens, S.W.	" 14
Nottingham—Laying-out and Planting Basford New Cemetery	Samuel G. Johnson, Town Clerk, Nottingham	" 15
Dorking—Workhouse Infirmary (£4,000 limit)	Geo. Scales, Clerk to Guardians, 35, High-street, Dorking	" 15
Nottingham—Designs for Basford Cemetery Buildings: Chapels, Crematorium, Lodges, &c.	Samuel G. Johnson, Town Clerk, Nottingham	" 15
Menai Bridge—Landing Pier (£3,000 limit)	Thos. Hughes, Clerk, Min-y-Den, Menai Bridge	" 16
Festiniog—Temporary Eisteddfod Pavilion for 10,000 (£900 limit)	Wm. Jones, Hon. Sec., Pavilion Committee, Blaenau, Festiniog	" 17
East Finchley—Mortuary Chapel in Islington Cemetery	Wm. F. Dewey, Clerk, Vestry Hall, Islington	" 17
Boote—Fire Brigade and Police Stations (£14,000 and £1,500 limits)	J. H. Farmer, Town Clerk, Boote, Lancs	" 31
Altrincham—U.D.C. Offices	J. Stokes, Clerk, 64, Market-street, Altrincham	" 31
Crich—Water-Supply Scheme (3,100 population)	Joseph Pym, Clerk, Belper	Jan. 8
Carlton, Victoria—Children's Hospital	J. Nicholson, Hon. Sec., Pelham-street, Carlton, Australia	" 30
Leicester—Motor Refuse Carts	E. G. Mawbey, Borough Engineer, Leicester	" 31
Port Elizabeth—Free Library (Assessors, Sir F. Blaine and R. H. Hammersley—Hunan—£22,000 limit)	G. Oettle, Librarian, Port Elizabeth, S.A.	Feb. 15
New York—Sun Dial (Plaster Model)	Sec. National Sculpture Soc., 215, West 57th-street, New York	" 28
Newcastle-on-Tyne—New Infirmary (local Architects)	Secretary Building Committee, Newcastle	Mar. 1
Belper—Sewage Disposal Schemes	Joseph Pym, Clerk, Belper	May 1
Wadebridge—Schoolroom, adjoining Wesleyan Church	Walter O. Wellington, Sec., Building Com., Wadebridge, Cornwall	—
Lymington—New Forest Hall (Limited to Hampshire Architects)	Clerk to Hall Committee, Lymington	—
Berwick—Police Station (£3,000 to £4,000 limit)	The Town Clerk, Berwick-on-Tweed	—

LIST OF TENDERS OPEN.

BUILDINGS.

Chorley—Infectious Wards, Administrative Block, &c., Heath Charnock	Joint Hospital Board	Jolly and Buckley, Architects, High-street, Chorley	Dec. 11
Darfield—Ten Houses	Overseers	A. B. Linford, Architect, Kelvin Cottage, Wombwell	" 11
Hatfield—Mortuary	Cemetery Committee	A. Whitby, Assistant Overseer, North-road, Hatfield	" 11
Neyland—Baptist Chapel at Neyland	Corporation	S. Wilson Edwards, Architect, Beach Mount Villa, Mumbles	" 11
Macclesfield—Construction of Vaults and Entombments at Cemetery (for Three Years)	Guardians of Sealecoates Union	W. Fred. Taylor, Town Clerk, Macclesfield	" 11
Campbeltown—Temporary Hospital	Co-operative Building Society	James Fullarton, Master of Works, Campbeltown	" 11
Hull—Alterations to Workhouse, Beverley-road	Hammersmith Vestry	J. P. Chatham, Clerk, Lincoln's Inn Buildings, Hull	" 11
Grangemouth—Sixteen Houses, Marshall-street	Wingate School Board	G. D. Page, Architect, Old Glebe Chambers, Falkirk	" 11
Hammersmith, W.—Disinfecting Chamber and Van Buildings, Chancellor's-road	Corporation	H. Mair, Surveyor, Hammersmith	" 13
St. Johnstown's Castle—Alterations and Repairs	Urban District Council	E. A. Hackett, Architect, Clonmel	" 13
Trimdon—Board School	Dr. Glegg	Jas. Garry, Architect, 27, Church-street, West Hartlepool	" 13
Gelli—Congregational Chapel	Corporation	Griffiths and Jones, M.M.S.A., Architects, Town Hall, Tonypandy	" 13
Guildford—Extension of Produce Shed in Cattle Market	Urban District Council	Ferdinand Sma lpeice, Town Clerk, Guildford	" 13
Llangnidr—Additions to National Schools	Great Western Railway Co. (Ireland)	F. Baldwin, Architect, 8, Lion-street, Brecon	" 13
Upholland—Waterworks Workshop	Corporation	G. Trevelyan Lee, Town Clerk, Town Hall, Dewsbury	" 13
Newcastle-on-Tyne—Primitive Methodist Schools	Great Northern Railway Co. (Ireland)	J. Bassett, Clerk, Council Offices, Upholland	" 13
Morecambe—Additions to House	Corporation	Dawson and Bendle, Architects, 33, Grainger-street West, Newcastle	" 13
Chester-le-Street—Shop and Wareroom in Market	Great Western Railway Co. (Ireland)	James Marshall, Architect, Bank-crescent, Morecambe	" 13
Nottingham—Additions to Lunatic Asylum	Joint Hospital Board	R. G. Cowe, Architect, Chester-le-Street	" 13
Birstall—Addition to Shop, Market-place	City of Cork Steam Company	G. T. Hine, Architect, 35, Parliament-street, Westminster	" 13
Dewsbury—Iron Shed at Gasworks	Great Western Railway Co. (Ireland)	John H. Brearley, Architect, Hanover-street, Batley	" 13
Raglan Station—Cottage	Great Northern Railway Co. (Ireland)	G. Trevelyan Lee, Town Clerk, Town Hall, Dewsbury	" 13
Annakera—Cottages at Monaghan-road Crossing	Corporation	G. K. Mills, Secretary, Paddington Station, W.	" 14
Colchester—Stables and Coach-house, Crouch-street	Great Western Railway Co. (Ireland)	T. Morrison, Secretary, Amiens-street Terminus, Dublin	" 14
Loddiswell, Devon—Cottages	Joint Hospital Board	Herbert Goodyear, Borough Surveyor, Colchester	" 14
Devizes—Additions to Wilts Lunatic Asylum	City of Cork Steam Company	G. K. Mills, Paddington Station, W.	" 14
Woodbridge, Guildford—Additions, Fever Hospital	Great Western Railway Co. (Ireland)	Charles S. Abye, County Surveyor, County Offices, Trowbridge	" 14
Cork—Stores and Residential Quarters, Patrick's Quay	Joint Hospital Board	E. L. Lunn, Architect, 36, High-street, Guildford	" 14
Garra Bridge Station, Devon—Cottages	City of Cork Steam Company	James F. McMullen, M.S.A., Architect, 30, South Mall, Cork	" 14
Pound-lane Crossing, Portadown—Cottages	Great Western Railway Co. (Ireland)	G. K. Mills, Paddington Station, W.	" 14
Blundenden—House	Fowey Yacht Club	T. Morrison, Secretary, Amiens-street Terminus, Dublin	" 14
Fowey—Club-house	Board of Guardians	S. Rivett, M.S.A., Architect, 3, South Quay, Great Yarmouth	" 15
Collingham Bridge—Organ Chamber and Vestry, Bridge Church	William Fletcher	Sampson Hill, Architect, Green-lane, Redruth	" 15
Rathdown—Cemetery Buildings	Urban District Council	C. Hodgson Fowler, F.S.A., Architect, The College, Durham	" 15
Forres—Shops and Dwelling-house, St. Catherine's-road	M. Robinson	J. D. Cope, Clerk, Loughinstown	" 15
Southend—Railway Tavern, Cliff Town-road	James Freethy	John Forrest, Architect, 129, High-street, Forres	" 15
Tewkesbury—Laundry, Fever Hospital	North-Eastern Railway Co.	Thompson and Greenhalgh, Bank Chambers, Southend-on-Sea	" 15
Hartburn—Additions to Landieu, Hartburn	Midland Railway Co.	H. A. Badham, Town Clerk, Tewkesbury	" 15
Barrow-in-Furness—Electric Lighting Station, Buccleuch-street	Sanitary Committee	A. Whipham, A.R.I.B.A., 59, High-street, Stockton-on-Tees	" 15
Methrth—Digging at Eglosmerth Farm	Bideford Bridge Trustees	Borough Engineer, Town Hall, Barrow-in-Furness	" 15
York—Extending Carriage-Building Shops	Sanitary Committee	George Gow, Tregothnan Office, Truro	" 15
Wolverhampton—Additional Platform and Awnings	School Board	C. N. Wilkinson, Secretary, N.E.R. Offices, York	" 15
Chorley—Free Library	Guardians of Enniskillen Union	James Williams, Secretary, Derby	" 16
Bromley, Kent—Four Pairs of Cottages	Urban District Council	Jolly and Buckley, Architects, High-street, Chorley	" 16
Llanwrtyd Wells—Three Houses and Shops	School Board	E. Bragg, East-street, Bromley	" 16
Ancoats, Manchester—Additional Stabling	Sanitary Committee	David Jenkins, F.R.I.B.A., Architect, Llandilo	" 16
Bridlington Quay—Four Houses, East Side	School Board	James Williams, Secretary, Derby	" 16
Glantham—Two Houses	Sanitary Committee	J. Earnshaw, M.S.A., Architect, Wellington-road, Bridlington Quay	" 16
Malvern—Timber Engine-Shed	School Board	George Reavell, jun., Architect, Alnwick	" 16
Holworth—Seven Houses and Shop, New-road Side	Sanitary Committee	James Williams, Secretary, Derby	" 16
Cefn Coed—Library and Dwelling-House	School Board	J. P. Kay, Architect, 34, Prudential Buildings, Leeds	" 17
Bradford—Herring-Curing Establishment, Buck-street	School Board	R. C. Jenkins, Surveyor, Cefn Coed	" 17
Grimby—Alterations to Premises, 242, Cleethorpe-road	School Board	Hodgson and Farrar, Old Bank Chambers, Bradford	" 17
Bridlington—New Grammar School	School Board	Mitchell, Son, and Co., Surveyors, 112, Cleethorpe-road, Grimby	" 18
Tunbridge Wells—Offices, Central Electric Station	School Board	Bottrill, Son, and Bilson, Architects, 23, Parliament-street, Hull	" 18
South Bank—Additions, Police Station	School Board	W. C. Cripps, Town Hall, Tunbridge Wells	" 18
West Burton—Wesleyan Chapel and School	School Board	Walter Stead, County Surveyor, Northallerton	" 19
Myndydlyn—Additions, Poultonfaith School	School Board	Wm. Lawson, West Burton	" 20
Briton Ferry—Villa Residence	School Board	C. R. Lyne, Clerk, Westgate Chambers, Newport, Mon.	" 20
Shrewell Cross, Tipperary—Two Schools	School Board	H. Alex. Clarke, Architect, Briton Ferry	" 21
Derrygonnelly Dispensary	School Board	Rev. Dr. O'Neill, P.P., Lattin	" 21
Barking—Electric Light Station, East-street	School Board	Richie Wilson, Clerk, Workhouse, Enniskillen	" 21
Buenos Ayres—Central Railway Station (cost, 4,000,000 piastres)	School Board	Edwin H. Lister, Clerk, Public Offices, Barking	" 21
Manchester—Thirty-two Two-story Tenements, Cornwall-street, and Eighteen Cottages, George Leigh-street	School Board	Legation of Argentine Republic, London	" 28
Bideford—Alterations and Repairs, Post Office	School Board	The City Surveyor, Town Hall, Manchester	" 23
Manchester—Thirty-six Two-story Tenements, Chester-street	School Board	Charles W. Hole, Bridge Steward's Office, Bideford	" 24
Burnley—Extension to Electric Lighting Station	School Board	The City Surveyor, Town Hall, Manchester	" 24
Printon-on-Sea—School (150 children)	School Board	G. H. Pickles, Borough Surveyor, Town Hall, Burnley	" 24
Copenhagen—Repairing Cemented Walls of Thorvaldsen's Museum	School Board	A. R. Chamberlayne, Clerk, Station-road, Clacton-on-Sea	" 31

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2241.

FRIDAY, DECEMBER 17, 1897.

LESSONS FROM THE GREAT CITY FIRE.

THE evidence already given before the City coroner in his inquiry into the cause of the great City fire practically confirms much of what we have said, that the buildings in the area destroyed, amounting to four acres, were built according to the requirements of the old Building Acts in force at the time, and were therefore not in accordance with our recent building law. According to the evidence given by Mr. E. Woodthorpe, F.R.I.B.A., district surveyor of the northern division of the City, many of the buildings burned down were erected during the lifetime of his father, and had been much altered within the last 18 years. Except the four walls, external and party structures, there was little or nothing of a fire-resisting nature in the buildings; indeed, the only surprise is that there have not been more fires. They were, in fact, merely brick shells, filled with inflammable fittings and stocks of goods. In another particular our remark is borne out that the ironwork let into the stonework let the buildings down, and to this cause was responsible a great deal of the damage and collapse of walls. "Very few walls," Mr. Woodthorpe said, "remained upright: several had collapsed that had been shaken by the sudden expansion and contraction of the ironwork, and the stone and brickwork were damaged by the excessive heat"—a statement which goes to prove the absolute uncertainty of ironwork, or the so-called "fireproof" qualities of buildings erected at that period. We were unaware whether there were many buildings in the destroyed area which could be classed as "fire-resisting." According to this witness, there "was not a single floor throughout the burned-out area that was fireproof or fire-resisting in any way." But as there was ironwork in some of the warehouses, which had helped to pull about the walls, it seems probable that there had been attempts in this direction, though they were anything but perfect, and that the ironwork was put up under former provisions. The number of "dangerous structure" notices served by the borough surveyor since the fire, and the number of walls that had collapsed, show the dangerous condition of walls in which iron has been fixed in rigid connection.

Then as to the interiors of these buildings, we learn that from the floors to the ceilings were practically "large wooden pigeon-holes with narrow passages between," that the staircases were of wood, the walls and ceilings match-lined—conditions most favourable to the rapid spread of fire. And we may be sure that this woodwork was dried almost to the point of ignition, especially the match-lined ceilings. But what is there to prevent warehouses being built now with wooden linings and ceilings, and with ill-protected staircases and wellholes? We know several warehouses and factories and offices full of wood-lined partitions where naked lights are used, staircases not inclosed by walls or fire-resisting partitions, where the rules of the new Building Act are not followed. And how many of these buildings are provided with fireproof doors of iron, or, if provided, are kept closed? Several openings in the warehouses in Jewin-street had no iron doors. The Building Act is powerless to cope with this danger, even though providing the means. Then we are told that local authorities are not able to enforce new rules; that they have no statutory authority to prevent

reconstruction on the same principle as the old. The new regulation as to party-walls—that they should be 3ft. above the roof—may be insisted on; but the surveyor cannot prevent well-holes. Again, only those buildings used wholly or in part as dwellings are provided with trap-doors or other access to roof.

The evidence showed that Winchester House, where there had been several fires, resisted the spread of the flames, owing to the fact that its floors were of iron and concrete, and there was a stone staircase. Mr. J. W. Penfold, F.R.I.B.A., bore out the evidence of Mr. Woodthorpe, and his remarks on the narrowness of the former streets, which varied from 11ft. 6in. at Aldersgate-street to 15ft. 3in. at Red Cross-street, are important. The Goldsmiths' Company were freeholders of the Cripple-gate area, and many improvements had been made by them. The total ground-rent was about £14,000. Other questions were raised of a subsidiary kind as to the coal and water supply; but the chief points of interest are those of structural resistance to fire. No doubt it would be impossible to expect the same fire-resisting construction in a warehouse as that of many City buildings; but the least that ought to be done would be to insist on iron and concrete floors, iron doors to all openings and windows, and proper escapes.

A large and influential deputation of owners, occupiers, and ratepayers of Cripple-gate attended a meeting of the City Commission of Sewers, to state what great losses they had been by the fire. They proposed several street improvements, to render the area less crowded by buildings and to give better access to the warehouses in the narrow streets and alleys which abound in this part of the City. One of the schemes approved by the deputation was that of Mr. H. H. Bridgman, a late member, to construct a wide new street from the corner of St. Giles's Church diagonally through the scene of the fire to Aldersgate-street, Barbican, and Goswell-road and Long-lane. This road would be a direct line of thoroughfare from the East End to the markets and Holborn via Fore-street, London Wall, &c. It would also relieve the traffic at the Mansion House. Jewin-street must also be reconstructed, as there the houses are back to back, and offer great facilities for the spread of fire. The memorial was referred to the Improvement Committee for consideration. The reconstruction scheme cannot be delayed, and whatever plan be adopted, the widening of the spaces between the blocks of building is of the first importance.

ROYAL ACADEMY SCHOOLS PRIZE DESIGNS.

WHETHER under the Academical régime there is something repressive of artistic genius we will not now discuss: certain it is that the Royal Academy Schools have not achieved any eminent success. What can be more disappointing than the amusing, almost comical, display of talent exhibited under the name of Historical Painting, the numerous competitive efforts for which have so far fallen short of the most ordinary standard that the Gold Medal and Travelling Studentship have not been awarded? Sir E. J. Poynter, the President, in distributing the prizes, speaking of the results, had to acknowledge, in regard to painting, which always held the principal place, as it was the most popular art of the three, that:—"Amongst the paintings in the gold medal competition were more than one which just fell short of the combined qualities that went to make a great work." It was, at least, discouraging that out of a large number of competitors for the subject given, "Cleopatra Clandestinely Introduced into the Presence of Caesar," not one was thought worthy to receive the medal. We see every conceivable

presentment of the Egyptian queen, graceful and coarse, refined and voluptuous, many of them hard and commonplace conceptions, and a few not unlike ballet dancers; but the way in which she is introduced, bodily dragged into the presence of Cæsar, or disclosed accidentally by the removal of draperies and Oriental wraps, is quite amusing. Then we see equal diversity in the conception and treatment of Augustus. In some cases he looks a "beak" or sitting magistrate of a Metropolitan police-court, except for his Imperial robe; in others he is a diminutive, pallid old man. Here we have him in all the pomp and ceremonial display of the Imperial palace; there he is painted as if he were crouching behind a desk or just entering a room. In short, the many and opposite conceptions appear humorous, if not ludicrous. In landscape painting there is a more agreeable standard of quality. Waning light and shade are more determinable elements than those involved in a figure composition, and hence the studies for "An Afterglow" are more successful. Alfred Priest wins the Turner Gold Medal and Scholarship of £50. The competition for "A Lock" shows a few clever works, and the prize is awarded to C. M. Q. Orchardson. The designs for the decoration for a public building, subject "Spring," show some invention. Miss Mary E. F. Brickdale wins the £40 prize for a design, which we shall publish. The composition is clever, and the scheme of colour decorative.

The architectural designs are not equal to our expectations. The subject given, "A Nobleman's Country House," demanded not only an acquaintance with Domestic architecture in its best periods, but also an experience of the requirements of a gentleman's residence in the country. Not everyone could bring these qualifications to the task, although a list of accommodation was furnished. Mr. Archibald H. Christie has taken the Gold Medal and Travelling Studentship (£200). His plan is broken, but fairly compact. A *porte-cochère* is provided on the entrance side, leading to a large hall with principal staircase. A cloakroom and lavatory on the left side, and a billiard-room on the right hand, are well arranged. A butler's pantry and corridor, access from kitchen offices, a serving-room near the dining-room, leave little to be desired in arrangement. The dining-room, sitting-room, and drawing-room occupy a projecting centre in the garden front, the business rooms are located in a wing, and the kitchen block on the other side. The internal corridor to these offices is not well lighted. The external design is shown by a carefully-drawn ink perspective, a Late Domestic Gothic building of stone. The windows are mullioned, and the entrance front is gabled. These gables are simply coped in stone, with rounded apices; and a very plain, almost hard, stone treatment is shown without any attempt at detail. The porch is repulsively plain and heavy. No. 222 has a clever quadrangular plan, and courtyard in centre. The hall is on the south-west side, with a wide corridor to reception rooms along a terrace. The business entrance, secretary's and steward's rooms, with their own corridor, are on the north-west side, and the kitchen offices on the north-east form a projecting wing. The hall is 60ft. by 30ft., the large drawing-room 26ft. by 23ft., with projecting mullion bays. A Tudor style is adopted, with bay windows; these and the details are weak. The lighting, partly by inner court, has been considered; the plan is better than the exterior design. No. 223 is a very confused plan. It has a hall in centre 50ft. by 30ft., and open court, which lights the principal stairs and butler's pantry. The front corridor is ill-lighted, also the servants' corridor in office block. The plan is cut up by breaks, which would entail cost. The design is chiefly of stone, with half-timber in gables

of small drawing-room, &c.—a mixture of material that is hardly justifiable. The drawings and perspective show a masterly hand. Several other designs, some very pretentious Italian and Classic buildings, are hung. No. 215 is in Georgian taste. The plan is symmetrical, with large central octagon hall, round which are grouped the reception-rooms. The vestibule is on the north-east side, and the kitchen offices and billiard-room, &c., form wings. The perspective shows the site laid out in straight avenues and parterres. No. 220 is another brick mansion in the same style, with wings, but the plan is wastefully distributed in hall and approaches. No. 218, in an English style, shows a few good details; but the plan is straggling. A great deal of labour has been thrown away in this competition by students who positively know little of the qualities of good planning. One design shows an oblong with prodigious angular projections at the corners.

In another gallery we see a plan for an art gallery, the prize being won by Mr. Horace C. Hide. In this competition plan only is studied. A central hall in front with entrance, the museums and picture galleries being arranged round two open courts—a far too ambitious theme for a student.

Turning to the sets of architectural drawings, the 1st silver medal has been taken by Arthur Maryon Watson for measured drawings of the library of Lambeth Palace—a carefully-executed set, the Juxon Hall, now the library, is drawn to a large scale. The second medal is not awarded. A purer Late Gothic example might have been taken. George J. J. Lacey wins the £25 prize for a tinted drawing of a groined gateway to college quadrangle. It has octagonal turrets at corners, and there is some freshness in the ornamental relief over the archway. We think the design (234) in Late Gothic character, in pencil, commendable also; a clever and original treatment (235) for stone, though rather severe. John Stevens Lee wins the prize for a set of drawings of a lych-gate, simply treated, the roof of green Westmoreland slates carried on oak beams. The details are plain and appropriate. One or two designs for a block of college rooms are also sent in.

We can only just refer to the prize cartoon of a draped figure. "Hermione as a Statue—the 'Winter's Tale,'" by Mary Towgood, the design of which we hope to give. The gold medal and travelling studentship for sculpture has fallen to a composition entitled "Charity," by Alfred Turner, for a conception in which there is promise and encouragement, and a knowledge of the figure. The other model, "Gladiators Fighting," the first prize of which is given to Gilbert W. Bayes, has also been well handled, with a sense of movement and of good outline.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary meeting of the Institute was held on Monday evening, the President, Professor Geo. Aitchison A.R.A., in the chair. The President moved that the resolution agreed to at the special general meeting of the 29th November be confirmed—viz.: That in order that the Council of the Royal Institute may remain in office until the close of the last general meeting in June of the year following that in which they were elected, the following alteration be made in Bylaw 30—viz., that in the last line but one of the final clause the word "last" be substituted for "past." The motion was unanimously adopted.

DEATHS OF WELL-KNOWN MEMBERS.

The President, who spoke with evident emotion, said he regretted to announce the death of their poor friend Mr. Octavius Hansard, who met with a terrible death by accident on the Metropolitan Railway; together with the hon. secretary, secretary, and many members of com-

mittee, he (the President) attended their friend's funeral at Brompton Cemetery last Thursday. They had sustained a still greater loss in the death of the Royal Gold Medallist, Mr. Pearson, who was at work in his office almost until the very last. His own recollections of Mr. Pearson went back to 1855, and all who also enjoyed the privilege of his friendship would agree that Mr. Pearson was a very fine specimen of the English gentleman, and, apart from this, he was a most distinguished church architect, if not the greatest of the present day; his works were to be seen all over the country, the principal one being Truro Cathedral, of which a leading Roman Catholic layman recently said it was the only modern church in which a Catholic could worship. All who knew Mr. Pearson loved him, and those who only know his works admired his genius. A vote of condolence with Mr. Pearson's family was passed in silence. Mr. W. EMERSON, hon. secretary, announced the recent deaths of Mr. William Stephens Cross, a Fellow since 1882; Joseph Battye, of Rusholme, Manchester, an Associate since 1881; and Arthur James Forge, of Gresham-buildings, E.C., an Associate since 1894.

REPORT ON EXPERIMENTS ON THE STRENGTH OF BRICKWORK.

The report on the third series of experiments, conducted by the Science Standing Committee to ascertain the average duration of various qualities of brickwork, was presented and read by Mr.

THIRD SERIES.—CRUSHING LOADS IN TONS PER SQUARE FOOT.

WILLIAM C. STREET, being a completion of the statements made before the Institute, and reported in our issues of April 3 and Dec. 18, 1896, p. 485 Vol. LXX. and p. 874, Vol. LXXI. The third series of tests were made by Messrs. Street, Clarke, Matt. Garbutt, and others, the site, as before, being land in front of the chief engineer's office and close to the hydraulic engine-house at the West India Docks, kindly lent by the docks committee. The hydraulic ram and engine were generously placed at the disposal of the committee by Sir William Arrol. The sections of wall were carefully built on platforms resting on tramway rails, and were run on the lines beneath the girder, the pressure being applied from below. The experiments were completed by the crushing of 20 short lengths of brick walls, each about 6ft. high by 27in. long, and 18in. thick. The committee did not propose at present to give any fixed rules based upon the results or information gained by these experiments, as it was hoped that the Council of the Institute would sanction the preparation of a careful analysis of the facts contained in the three reports, and issue it in a suitable shape. If this were done it might be possible to generalise and formulate rules to govern the use of different kinds of brickwork as the supporting features of the structures erected under their superintendence. Meanwhile a few impressions could be given. The resistance of brickwork in lime mortar to crushing seemed to vary from one-sixth to one-eighth of the resistance offered by the brick itself, while in cement mortar it varied from one-half to one-fifth of that strength. So, while cement mortar materially aided the weaker bricks in their combined strength, it could not materially affect the ultimate power of resistance in brickwork made of a harder variety. The different specimens in lime mortar and those in cement mortar showed comparatively little difference in the respective rates at which the beds were crushed. The only question was how long the bricks would be able to resist the pressure if the load were increased at these rates. The average thickness of the bricks was 2½in., and the total thickness of the mortar beds 6in., while the compression of the lime mortar beds averaged 1in., and that of the cement mortar beds about ½in. This proved that the mortar generally was well crushed and disintegrated long before the final collapse of the several examples of brickwork. In dealing with the working load that might be calculated upon care must be taken not to impose such a load as would materially damage the structure of the brickwork.

At one-fifth of the crushing load the compression in lime mortar averaged ¾in. in 6ft. of brickwork, and in cement mortar it averaged ½in. The great difference between dead and live loads must not be lost sight of. Taking a safe load as one-fifth of the crushing load, it might be assumed from the results obtained, that in lime mortar stock brickwork is equal to about 3½ tons, gault 6 tons, Fletton 6 tons, Leicester reds 9 tons, and Staffordshire blue 23 tons per square foot. In Portland-cement mortar, 1 to 4, stocks would be equal to about 8 tons, gaults 10 tons, Fletton 11 tons, Leicester reds 17 tons, and Staffordshire blue 24 tons per square foot. Under the ordinary or average conditions of practice, the form of brickwork did not greatly affect the strength, the 18in. square piers having given approximately similar results per square foot to those obtained from specimens 27in. by 18in. With regard to the effect of age upon the different varieties of brickwork, results showed that, except in the case of blue bricks in cement, those built three months gave very similar result to those built five months. The difference in the case of the blue bricks was partly due to the fact that the bricks of which the specimens 27 by 18 were built were from a stronger lot than those of which the 18in. square were built, the samples from each delivery failing respectively at 779 and 701 tons per square foot. The Committee's conclusions as to the results of the present experiments are set forth in the following table:—

Mr. Street's report was supplemented by some remarks by Mr. MAX CLARKE, who exhibited and explained a series of lantern reproductions of photographs of the five classes of brick set in mortar and cement, and pointed out the manner in which the several materials gave way. The softer bricks, such as stocks and gaults, yielded slowly; but the harder ones, Leicester reds and Staffordshire blues, snapped so suddenly that it proved almost impracticable to obtain a satisfactory photograph at the exact moment of collapse. Mr. Clarke replied to some criticisms of the experiments, and said that they were conducted with the greatest care, were perfectly accurate, and agreed generally with independent tests. The committee would have liked to have carried the experiments further; but the £200 raised had been exhausted, and there was, indeed, a balance against them. He mentioned that, having seen an advertisement by a maker of a Fletton brick that the material had withstood pressures of 230 tons per square foot, the committee, astonished at so high a record and one so far beyond the results obtained by them, obtained samples which broke at 44 tons—about the average for these bricks. While exhibiting the views, Mr. Clarke replied to many questions put by the President, Messrs. W. Woodward, William White, Silvanus Trevail, Francis G. F. Hooper, and others.

Mr. PERCIVAL GORDON SMITH, architect to the Local Government Board, as Chairman of the Science Committee, moved a hearty vote of thanks to Messrs. Street and Clarke and their colleagues on the sub-committee, pointing out that on this occasion the tests dealt with short lengths of walling, 18in. by 27in., and 6ft. in height, instead of with square piers as before. He wished that a little more money could have been furnished to carry the tests further. In the vote of thanks he included the names of Sir William Arrol and Mr. H. F. Donaldson, the engineer to the West India Docks Committee.

CRITICISM OF THE REPORT.

Professor W. CAWTHORNE UNWIN, F.R.S., regretted that the series of experiments which had been three years in progress had been brought to a close. At the same time, he must remind members that the final report was not drawn up by the general committee, but only by two members of that body; and while he would be the last to suggest that Messrs. Street and Clarke had not given enough time and trouble to the tests, he felt compelled to offer some criticism

Messrs. Gould and Scott, Falkirk; 43, Mr. B. Pite, London; 44, Mr. A. H. Hart, London; 45, Mr. F. Baggallay, London; 46, Mr. Herman, Birmingham; 47, Messrs. ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—XII.

By an Assoc. Inst. Elect. Eng.

CONDUCTORS IN PRACTICE.

METHODS OF DISTRIBUTION.

THE varying conditions which are met with in practice demand different methods of connecting the lamps and other receiving devices according to the nature of the requirements. As we have already explained, when dealing with the arrangement of circuits, there are two different methods of connecting the receiving mechanisms—i.e., the *series* and *parallel* arrangements; and it is now necessary to consider the various features and modifications of these arrangements according to cases for which they are applicable. We shall consider them in the natural order in which they were introduced.

Series Distribution.—As is obvious, the simplest and most primitive method of distributing electrical energy is to connect directly one receiving device to the generator or source of supply, and this was the method adopted in the first attempts at distribution, and it necessitated but short leads. As the distribution of electrical energy developed, the natural result was to include in one circuit several receivers, placed so that the same current

FIG. 16.

passed through them in succession, giving rise to the term *Series Distribution*. Such a system of distribution is represented in Fig. 16, in which the receiving devices are arc lamps.

Since each lamp requires a definite and constant current, it follows that the pressure impressed on to such a circuit varies with the number of lamps in the circuit. The constant current, of course, is that required by each receiver, and the conductor forming the line will have a constant cross-sectional area throughout, fixed by the strength of the current traversing the circuit. As will be observed, the current commences at the positive terminal of the generator, and passes successively through the lamps back to the negative terminal of the generator, and, in general, this system is restricted to working arc-lamps in series and to the transmission of power (motor working). It is also evident that the number of lamps is limited. Since the output of a generator is given by the product of the pressure and current, or—

$$W = C \times E,$$

and with series working the current C is constant; therefore—

$$W \text{ is proportional to } E,$$

or, in other words, the output of a series generator is limited by the electromotive force generated. Thus, if e be the pressure required by each of the n individual lamps connected in series, then the total E.M.F., E , which the dynamo must generate may be found as follows:—

$$E = n \times e + \text{drop in volts in the leads} + \text{drop in volts in the dynamo.}$$

Now, arc lamps take from 45 to 50 volts and 10 or 12 amperes, and it is clear that with 50 lamps in series, from 2,000 to 3,000 volts will be required, so that the generators used in connection with series working are high-pressure machines. But high-pressure generators introduce difficulties. Perfect insulation in the

dynamo itself is more difficult to attain, and it is difficult to collect and commutate the current at such high pressures without excessive sparking; from which it is clear that the pressure got from

I Simple parallel system

II Complete parallel system

FIG. 17.

one dynamo is limited, and, therefore, the number of lamps is limited. With closed-coil armatures about 2,000 volts is the limit for safe working, whilst with open-coil armatures about 3,000 volts is the limit. In America, where arc-lighting has grown rapidly and is used extensively, the circuits often have more than 100 arc lamps connected in series, in which case the E.M.F. required exceeds that given above as the limit for a single generator. It is, therefore, an advantage to be able to connect two generators in series, for by so doing the pressure difficulty is successfully overcome. The usual method of doing this is to couple two generators mechanically to one driver—engine or turbine—and to couple the two armatures in series electrically. Usually the number of arc lamps in a circuit varies but little, and when it is necessary to vary the E.M.F. impressed on the circuit, it is necessary to alter the speed of the engine, the position of the brushes, or the excitation of the field-magnets, since a series machine will not automatically regulate itself. It will, therefore, be evident that street-lighting by arc lamps offers the most favourable conditions for the series method of distribution, for in street or open-space lighting the lamps may be placed at regular intervals apart. Furthermore, if we consider the economical condition of the line—i.e., cost of the copper—it is apparent that the capital expenditure is small, since the pressure is high and the current small. The annual waste of energy (the C^2R losses) are also diminished by increasing the pressure, in addition to which the length of the circuit and the distance between the lamps may be increased. We may mention here that the illuminating power of the lamps is not altered if the pressure given by the generator is proportional to the number of lamps in use, and the current be maintained constant, because the illuminating power depends on the current only. Whilst by increasing the pressure the percentage loss of pressure in the mains for a given length is diminished; it must, however, be borne in mind that a more perfect insulation is required, and prime cost of line is thereby increased.

Although distribution by the series system is

FIG. 18.

especially adapted for series arc-lighting, for which purpose it is economical, it is not generally applicable for general distribution purposes, and in some respects possesses decided disadvantages. We have already shown that the number of

lamps that can be used is limited; it is not, therefore, applicable for incandescent lighting for houses, as the number of lamps required is often large, nor would it be safe to take high pressures into the houses. Then, again, if the circuit be broken at any point—as would be the case when a lamp filament breaks—all the lamps would go out unless each lamp be provided with an automatic arrangement for short-circuiting the lamps when not in use. Series arc lamps are in all cases provided with such devices. Moreover, the copper losses in the leads remains the same with the series distribution, whether all the lamps are in use or only part of them: there is thus at times an unproductive expenditure in the mains. These remarks apply more particularly to incandescent lighting than to arc-lighting, in which the shunting device or automatic cut-out works well. For the series system to work economically, it is necessary to have a uniform and constant load, as very little flexibility exists.

Parallel Distribution.—When incandescent lighting was introduced the supply of electrical energy developed much more rapidly than it had done during the period when arc-lighting only was possible on a commercial scale, and it was soon found that more variation in the strength of the current and in the amount of energy supplied to individual customers was required than the series distribution permits. More flexibility generally and individual independence of the lamps were also demanded, and by a process of evolution distribution by constant current changed to distribution by constant pressure and varying currents. As is well known, this system satisfies most of the conditions imposed, and, as we shall show, permits great flexibility, modification, and extension, and, generally speaking, may be said to be applicable to the varied conditions met with in practice. The method

FIG. 19.

adopted is to form a number of separate paths, so that the current is divided into branch circuits, as shown in Fig. 17 I, and although the separate branches are not necessarily parallel, the general characteristic parallelism has given rise to the term *parallel* or *multiple arc distribution*. As will be observed, the separate branches containing a lamp or motor are placed between the main cables, which, being connected to the generator, is maintained at a constant potential. Each branch or receiving appliance is supplied with a switch, by which means each lamp is independent of all the others, and adding or taking out a lamp has very little effect on the others. Since the essential condition for the successful working of the method is constant pressure, it is evident that a generator giving varying currents at constant pressure is required as the source of supply. This difficulty has practically been overcome by introducing the compound-wound dynamo, which permits much variation in current strength without much attention. Furthermore, the E.M.F. impressed on to the circuit to give a steady light must correspond to that required by the lamps, whilst the current must be proportional to the number of lamps in use at any time. For the sake of economy, the pressure should also be high, though compared with that impressed on the arc-light circuit it is small. When we remember, however, that the common lamp voltage is 100 volts, and that the present tendency is to use 200 or higher voltages, it is evident that the generator must give more than 100 volts in the first case and over 200 volts in the latter, since there is a definite loss of pressure in the mains equal to $C \times R$. But the current C varies with the number of lamps in use, and since—

$$e \text{ (current per lamp)} = \frac{\text{watts}}{\text{volts}}$$

$$C \text{ (total current)} = n \times \frac{\text{watts}}{\text{volts}}$$

where n = number of lamps in use. It is there-

fore evident that the current will be large, necessitating mains of large cross-sectional area if the loss in pressure is to remain small. In this respect the system compares unfavourably with the series distribution. The cost of the main conductors being prohibitive for extended areas, and the farthest lamp should not be more than 200 yards from the generator, as the prime cost

As a means, however, of preventing unequal fall of pressure, the *loop system* (Fig. 20, II.) and the *reversed parallel system* (Fig. 20, I.) are probably the best that have been devised. It is clear that the light from the lamps will be more uniform because of the tendency to equalise the fall of pressure by sending the current used round the whole circuit. The disadvantage of this method is that the first cost is greater, and the fall of pressure is not equalised unless the same amount of current is used at different points. We shall refer to this later.

A very useful modification known as the *ring method* is shown in Fig. 21. The distributing mains are arranged as a ring or other closed figure, so that there is the same length of main on the two sides of the feeding points. This method is particularly adapted for dome lighting, in which case the mains would be arranged as circles. So far, we have not dealt with the quantitative relationships in connection with the methods explained. The following worked examples will therefore be useful, and will show how to tackle the problems which occur in practice. The student will find it interesting and useful to take several examples for making comparison between the various systems.

Example 1.—What percentage loss of potential is there when 50 amperes are sent through 100 yards of copper $\frac{1}{8}$ in. diameter, if the initial potential is 110 volts? A foot of copper wire 1 mil. in diameter has 10 ohms resistance.

Since drop in volt or loss of potential = $e = C \times r$,
and r , the resistance of 100 yards of $\frac{1}{8}$ in. copper
= 10 ohms $\times \frac{100 \times 3 \text{ (feet)}}{1 \text{ (foot)}} \times \frac{(.001)^2}{(.125)^2} = 0.192 \text{ ohm}$
 $\therefore e = 50 \text{ (amperes)} \times 0.192 \text{ (ohm)} = 9.6 \text{ volts.}$
volts volts
And—110 : 100 :: 9.6 : p (percentage loss)
 $\therefore p = \frac{9.6}{110} = 8\frac{1}{2}\%$ per cent.

Example 2.—Determine the diameter of copper bars employed to carry 4 000 amperes from a dynamo to a furnace, 10 yards apart, if the drop in volts in the bars is 0.1 volt.

Let r = resistance of the 20 yards of the bar (lead and return), then—

0.1 volt = $4,000 \times r$
and— $r = \frac{0.1}{4000} = 0.000025 \text{ ohm}$
 $\therefore$ resistance per inch of bar
= $\frac{0.000025}{3 \times 20 \times 12} = \frac{0.0000025}{72} \text{ ohm.}$

Now the resistance of a cubic inch of commercial copper is 0.0000068 ohm (see Article X., p. 788), and resistance is inversely as sectional area.

$\therefore \frac{0.0000025}{72} \text{ ohm} : 0.0000068 \text{ ohm}$
:: 1 sq.in. : A (area of bar)
and— $A = \frac{0.0000068 \times 72}{0.0000025} \text{ sq.in.} = 19.584 \text{ sq.in.}$

But area of round bar = $\frac{\pi d^2}{4}$
 $\therefore d = \sqrt{\frac{19.584 \times 4}{\pi}} = 4.99 \text{ in.}$

Example 3.—If 10 arc lamps, each having a 1.5 ohm resistance, are arranged in series 40 yards apart, what must be the diameter of the leading wires if the conductance is 90 per cent. of that of pure copper, and the total resistance of the leads is 4 per cent. that of all the lamps? The dynamo is 20 yards from the first and last lamp. The resistance of pure copper wire 1 ft. long and 1 mil. diameter is 9.94 ohms.

Total resistance of the 10 lamps = $10 \times 1.5 = 15 \text{ ohms}$
" " " leads = $\frac{1}{10}$ of 15 = 0.6 ohm.
" length " " = $(2 \times 20 + 9 \times 40) \text{ yds.}$
= 400 yds. = 1,200 ft.
 $\therefore$ resistance per foot of leads
= $\frac{0.6}{1,200} \text{ ohm} = \frac{1}{2,000} \text{ ohm.}$

and since resistance varies inversely as sectional area—

$\therefore \frac{1}{2,000} \text{ ohm} : 9.94 \text{ ohms} :: \frac{\pi (.001)^2}{4} : \pi \frac{d^2}{4}$
where d is the diameter required.

$\therefore d = \sqrt{9.94 \times (.001)^2 \times 2000}$
= 0.141 in. = 14.1 mils.

Example 4.—Determine the area in square inches of the copper leads required to carry the current for 250 60-watt 100-volt lamps connected in parallel. The lamps are all placed in a room

75 yards from the dynamo, and the loss in volts has not to exceed 2 per cent.

Current for each lamp = $\frac{60 \text{ watts}}{100 \text{ volts}} = 0.6 \text{ ampere.}$

Total current = $250 \times 0.6 = 150 \text{ amperes, and}$
lost volts for $2 \times 75 \text{ yards} = 2 \text{ volts.}$

$\therefore$ resistance of 150 yards of leads = $r = \frac{2}{150} \text{ ohm.}$

Now— $r = \frac{\rho L}{A}$

where ρ = specific resistance of the copper = 0.0000068 ohm (per cubic inch).

L = length in inches and A = area in square inches.

$\therefore \frac{2}{150} = \frac{0.0000068 \times 150 \times 3 \times 12}{A}$,

and— $A = \frac{150^2 \times 0.0000068 \times 150 \times 3 \times 12}{2} = 2754 \text{ sq.in.}$

Example 5.—A, B, and C are three points, each at a distance of 157 yards from the next. At A there is a dynamo, at B a group of 200 incandescent lamps requiring 110 volts at 0.75 ampere each, and at C a group of 250 lamps requiring 100 volts and 0.83 ampere each. Calculate the diameter of the copper conductor that must be used for the lead and return wires between A and B and between B and C respectively, if the potential difference maintained at the terminals of the dynamo is 112 volts. One yard of commercial copper wire 1 sq.in. in section has 0.00002435 ohm resistance.

The arrangement and particulars of the circuit are given in Fig. 22.

The total current used—
= $(200 \times .75) + (250 \times .83)$
= $150 + 207\frac{1}{2} = 357\frac{1}{2} \text{ amperes.}$

(a) Since the lamps at B require 110 volts, the permissible drop in volts between A and B (lead and return) is 112 — 110, or two volts—that is, the resistance of 157 yards of the cable used

FIG. 22.

between A and B must be sufficient to diminish the pressure one volt. That is—

1 volt = $357\frac{1}{2} \text{ amperes} \times R \text{ ohms,}$
and— $R = \frac{1}{357\frac{1}{2}} = \frac{2}{715} \text{ ohm.}$

But 157 yards of copper 1 sq.in. section has resistance of $157 \times 0.00002435 \text{ ohm.}$ Therefore, if d = diameter of the conductor A B—

$\frac{2}{715} \text{ ohm} : 157 \times 0.00002435 \text{ ohm} :: 1 \text{ sq.in.} : \frac{\pi d^2}{4}$
 $\therefore d = \sqrt{\frac{157 \times 715 \times 0.00002435}{2 \times .7854}} = 1.31 \text{ in.}$

(b) The current required for lamps at C
= $(250 \times .83) \text{ amperes} = 207.5 \text{ amperes.}$
And the drop in volts between B and C (lead and return) is 110 — 100, or 10 volts, that is, the resistance of 157 yards of cable used between B and C must be sufficient to diminish the pressure 5 volts.

$\therefore 5 \text{ volts} = 207.5 \text{ amperes} \times R \text{ ohms,}$
and $R = \frac{5}{207.5} = \frac{10}{415} = \frac{2}{83} \text{ ohm.}$

And, as above—
 $\frac{2}{83} \text{ ohm} : 157 \times 0.00002435 \text{ ohm} :: 1 \text{ sq.in.} : \frac{\pi d^2}{4}$,
from which $d = .449 \text{ in.}$

Example 6.—Current is required along a street 2,000 ft. long, at the rate of 1 ampere per 10 ft. of frontage. Give sectional area of conductor, so that the difference of pressure between any two lamps shall not exceed 2 volts in the following two cases:—

(a) The current being supplied at one end.
(b) The current being supplied midway. (N.B. The resistance of a copper bar 1,000 ft. long,

II Loop systems

FIG. 20.

of the mains increases rapidly. If the size of the mains is diminished for the sake of economy, then the loss of pressure increases, and the essential feature of the system is to keep this small, and with little variation, so that a compromise or a satisfactory mean between the two limits is taken. On the other hand, it is evident that the waste of energy in the mains is at all times proportional to the useful energy, since the current varies with the load; that satisfactory insulation is readily attained; that the system is simple, and that there is no danger from shocks. It is, in fact, a system specially adapted for small and private installations. Fig. 17, II., represents a complete example of parallel distribution.

To overcome the disadvantage of the pressure falling as the distance from the dynamo increases, a number of modifications and combinations of the series and parallel systems have been proposed and adopted in practice.

In the *Multiple Series* arrangement shown in Fig. 18, two or more lamps of smaller voltages are connected in series between the mains. In this case it is evident that the total current will be—

C (total current, 2 in series) = $\frac{n \times \text{watts}}{2 \times \text{volts}}$,

so that only half the current will be used, necessitating only half the cross-sectional area of the mains. This saves copper. Two 50-volt lamps, for instance, may be connected in series across 100-volt mains; but there is this disadvantage, that if one lamp goes out, both go out.

In the *Series Grouping*, shown in Figs. 19, I. and 19, II., a group of incandescent lamps are connected in series. This method may be adopted when it is desired to use glow lamps on arc-lighting circuits. Fig. 19, I. represents a combination of incandescent and arc-lighting. If the arc lamps take ten amperes, then each group of glow lamps must take ten amperes, and no variation in the number of lamps used can take place, for we have here a constant

FIG. 21.

current circuit. The disadvantage of this combination is that the remaining lamps may be injured by the excess of current if one or more lamps break. It is convenient for business premises where a small number of arc lamps are required. Fig. 19, II., represents a similar arrangement.

and 1sq.in. in cross section, may be taken as .008 ohm).

(a) Current supplied at one end—

$$\text{Total current} = \frac{2,000}{10} = 200 \text{ ampères,}$$

and assuming that the current is uniformly distributed along the mains, the mean or average current required—

$$= \frac{1}{2} \times 200 = 100 \text{ ampères.}$$

And since the drop in volts between the first and last lamp = 2 volts, the resistance of 4,000ft. of the mains (lead and return)—

$$= \frac{2}{100} = 0.02 \text{ ohm.}$$

Now the resistance of a copper bar 4,000ft. long and 1sq.in. in cross section—

$$= 4 \times .008 = .032 \text{ ohm.}$$

$\therefore .02 \text{ ohm} : .032 \text{ ohm} :: 1 \text{ sq.in.} : A \text{ square inches,}$

$$\text{and } A = \frac{.032}{.02} = 1.6 \text{ sq.in.}$$

(b) Current supplied midway. Mean current = 50 ampères.

$\therefore$ Resistance of 2,000ft. (lead and return) of mains

$$= \frac{2}{50} = .04 \text{ ohm,}$$

and resistance of 2,000ft. of a copper bar 1sq.in. in cross section = $2 \times .008 = 0.016 \text{ ohm.}$

$\therefore .04 \text{ ohm} : 0.016 \text{ ohm} :: 1 \text{ sq.in.} : A \text{ square inches,}$

$$\text{and } A = \frac{.016}{.04} = 0.4 \text{ sq.in.}$$

(To be continued.)

NOTES ON SURVEYING AND LEVELLING.—IX.

By WALTER TESTER.

MENAGERIE UNDER CYCLE TRACK.

THE plan, Fig. 1, and section, Fig. 2, show the building to be erected under the end of the cycle track for a menagerie, aquarium, &c.; it is to be inclosed by the concrete retaining wall already mentioned, which is returned to form the end walls, and by a brick wall at the front, the track being carried by steel girders resting on piers in the walls, and on intermediate stanchions as shown on the section, Fig. 2. In order that the length and the level of the girders shall be uniform, the upper portion of the concrete wall

and the front brick wall require to be set out to follow the curves of the cycle track from the correct centres for finishing the latter, which are put in on the formation level, as explained in the article on the Athletic Grounds, and it will be assumed that the upper part of the retaining wall has been adjusted by varying the projection of the piers, the front faces of the latter being made coincident with the edge of the track. The lower portion of wall being struck out with a radius of 159ft. to the face of the piers, and the radius for finishing the part of the cycle track on the north side of the axis line being 157ft. 3½in. to the edge of the track, then if the centre point is moved 1ft. 8½in. towards the wall the curve will coincide with the original one at the centre line, but will draw inside it as the distance from the axis increases, the face of the piers next the centre line running straight up without an offset, and the set-back increasing with the distance from the axis. The body of the upper portion of the wall can be struck out concentric with the lower part. In a similar manner the wall on the south side of the centre line is dealt with; but as the difference between the radius for the lower portion of the wall and the one for finishing the cycle track is only 7in., there will be less variation in the offsets of the piers.

The front wall has to be proceeded with and the stanchions erected in readiness to receive the girders at the same time that the upper portion of the retaining wall is being completed; and when the brick wall has to be set out, the sheeting for concreting is fixed in position, and standing up a considerable height above the ground on the football field side which has not yet been filled in against the retaining wall. The front wall must be set out independently of the concrete wall, as the lower portion of the latter is not sufficiently accurate to measure from; and as the ground on the menagerie side is something like 16ft. below the top of the close sheeting, it would be difficult to measure out lengths from the centre-points, and the surveyor decides only to run the axis-line out and to measure accurately the required dimension and then to set out lines on the lower level for marking the points on the curves for the brick wall.

In order to carry out this intention, a number of dimensions must be calculated (see Fig. 1). The conditions to which the surveyor has to conform are as follows:—The brick wall is to be built in straight lengths between the piers, which

are spaced 24ft. apart from centre to centre, and the radius of the wall B C D E on the north side of the axis is to be 192ft. to the outer main face at the points where the straight lines meet at the centres of the piers.

Taking one full bay, and running lines to the centre point to form a triangle A C D, the three sides of which are given—viz. :—

$$CD = 24 \text{ ft. } AC, AD \text{ each} = 192 \text{ ft.}$$

$$\text{Then— } \cos. A = \frac{AC^2 + AD^2 - CD^2}{2 AC \times AD}$$

$$\cos. A = \frac{192^2 + 192^2 - 24^2}{2 \times 192 \times 192}$$

$$= .9921875 = \cos. 7^\circ 10'$$

Therefore each bay is subtended by an angle of $7^\circ 10'$ at A, and the angle next the axis line is $3^\circ 35'$ corresponding to half a bay.

Adopting a line F K at right angles to the centre line A B, and keeping it a sufficient distance outside the brick wall to be clear of the excavations for the foundations so that the pegs will not be disturbed, say—

$$AF = 195 \text{ ft. } 6 \text{ in.}$$

and producing the radial lines for each bay to cut F K in G H and J, three right-angle triangles are obtained—viz., A F G, A F H, and A F J containing angles at A of $3^\circ 35'$, $10^\circ 45'$, and $17^\circ 55'$, and of which the length of one side A F is known. Then each of the other sides and angles can be obtained by calculation, and the lengths of the lines A G, A H, and A J being found, by deducting 192ft. from each, the distances G C, H D, and J E back to the points on the curve will be arrived at.

The save calculation, and for convenience in setting out, F K is only continued a short distance to cut a radial line through the centre of a bay, and then another line, K L, is adopted, making the same angle with the radial line, and lying in a similar position in relation to the curve as F K, and it will only be necessary to reverse the order of the measurements at point K. At L the dimensions will again reverse the line L M, corresponding to K L and F K. Then, in the triangles—

AFG.	AFH.	AFJ.	AFK.
Angle A = $3^\circ 35'$	A = $10^\circ 45'$	A = $17^\circ 55'$	A = $21^\circ 30'$
F = 90 0	F = 90 0	F = 90 0	F = 90 0
G = 86 25	H = 79 15	J = 72 5	K = 68 30
Totals.. $180^\circ 0'$	$180^\circ 0'$	$180^\circ 0'$	$180^\circ 0'$

FIG. 2.

Using the formulæ for right-angle triangles:—

In AFG:—

$$FG = AF \times \tan. A = 195.5 \times \tan. 3^\circ 35'$$

$$AG = AF \times \sec. A = 195.5 \times \sec. 3^\circ 35'$$

$$FG = 195.5 \times .0626226 = 12ft. 2\frac{1}{2}in.$$

$$AG = 195.5 \times 1.0019589 = 195ft. 10\frac{1}{2}in.$$

In AFH:—

$$FH = AF \times \tan. A = 195.5' \times \tan. 10^\circ 45'$$

$$AH = AF \times \sec. A = 195.5' \times \sec. 10^\circ 45'$$

$$FH = 195.5 \times .1898559 = 37ft. 1\frac{1}{2}in.$$

$$AH = 195.5 \times 1.0178621 = 198ft. 11\frac{1}{2}in.$$

In AFJ:—

$$FJ = AF \times \tan. A = 195.5 \times \tan. 17^\circ 55'$$

$$AJ = AF \times \sec. A = 195.5 \times \sec. 17^\circ 55'$$

$$FJ = 195.5 \times .3233125 = 63ft. 2\frac{1}{2}in.$$

$$AJ = 195.5 \times 1.0509667 = 205ft. 5\frac{1}{2}in.$$

In AFK:—

$$FK = AF \times \tan. A = 195.5 \times \tan. 21^\circ 30'$$

$$FK = 195.5 \times .3939105 = 77ft. 0\frac{1}{2}in.$$

Then—

$$GC = 195' 10\frac{1}{2}in. - 192' 0' = 3ft. 10\frac{1}{2}in.$$

$$HD = 198' 11\frac{1}{2}in. - 192' 0' = 6ft. 11\frac{1}{2}in.$$

$$JE = 205' 5\frac{1}{2}in. - 192' 0' = 13ft. 5\frac{1}{2}in.$$

Similar calculations are made for the part of the wall on the south side of the axis line, the first operation being to determine the angle which each bay represents at the centre-point for this portion, which is 1ft. 1\frac{1}{2}in from point A. The three sides of the triangle are, therefore—

$$\begin{array}{r} 192ft. 0in. + 1ft. 1\frac{1}{2}in = 193ft. 1\frac{1}{2}in. \\ 24ft. 0in. \\ \hline 193ft. 1\frac{1}{2}in. \end{array}$$

Then, using the same formula as before, the angle at the centre-point is found to be $7^\circ 7\frac{1}{2}'$. All the other dimensions required are obtained in precisely the same manner as already described. They are given on Fig. No. 1, and need no further explanation.

The surveyor can now proceed to set out the dimensions on the ground, and commences by producing the central axis line with the theodolite and measuring out the length 195ft. 6in. from A, carefully plumbing down from the higher to the lower level at the outside of the concrete wall, and making sure that F is correct in position. He also marks a point on the line a considerable distance beyond F, retaining all lines by pegs with nails in them, set to the exact positions with the theodolite.

The instrument is then placed over F, and a line is set out at right angles to, and on each side of, the axis; the length of the centre line beyond F being used, as the surveyor cannot see back on the line towards A.

Along the portion FK the lengths 12ft. 2\frac{1}{2}in., 37ft. 1\frac{1}{2}in., 63ft. 2\frac{1}{2}in., and 77ft. 0\frac{1}{2}in. are measured, and the corresponding dimensions at the other side, then at each of the points G, H, and J, the theodolite is placed in succession, and the angles which the radial lines make with FK are set out, the points being retained with permanent marks on the concrete wall. The instrument is next placed at K, and the line KM set out at an angle of 137° with KF. Along KM the lengths to the points where the radial lines cut and the angles are set out as for FK. In the same manner the position on the south side of the axis line is marked out, using, of course, the proper dimensions and angles for that side.

A line can be strung between points G H I, &c., and the marks on the concrete wall and lengths 3ft. 10\frac{1}{2}in., 6ft. 11\frac{1}{2}in., 13ft. 5\frac{1}{2}in. &c., measured out for the brick wall; also the requisite dimensions for fixing the position of the stanchions, which must line with the piers.

The radial lines can easily be marked out on the higher level with angles set with the theodolite, placed at the centres, and if the surveying operations have been carried out accurately, the piers on the brick wall and the stanchions will be exactly on the lines, and as the piers on the concrete wall are spaced to line with them, and

there is plenty of width to allow a little play, there will be no difficulty in getting the steel girders into position.

As soon as the concrete arching is done, the surveyor can put in the section lines and levels for finishing the cycle track in a manner similar to that already described for the other end of the track.

BUILDING MORTAR.

A RECENT correspondence in the BUILDING NEWS suggests the desirability of reviewing the present state of our knowledge of the materials ordinarily employed in making building mortars, and doing so in a manner to render the subject intelligible to practical men who have little time or opportunity to study the history and science of the matter for themselves. The substance of these articles must, therefore, be more or less elementary in character, and involve statements already well within the knowledge of chemists and others who have studied the subject; but will probably be altogether new to many persons engaged in building who have used limes and cements frequently without giving the chemistry of the subject a thought, though an acquaintance with this would be of the utmost importance to them. Lime, as is well known, is the principal ingredient which has been used in making mortars and cements for binding bricks and stones together in all buildings, from the earliest times to the present day. The Phoenicians, Egyptians, Greeks, and Romans, as well as other civilised people, all used lime mortar to bind the materials of their walls together, and the goodness of this mortar as a permanent cementing material has passed into a proverb. Coming nearer home, and to more recent times, lime mortar was used throughout this country by the Mediæval builders, and its badness as a cementing material is equally proverbial, for whilst Roman mortar is now found to be as hard as the stones and bricks themselves, it is no uncommon occurrence to find much of the mortar of our old churches without cohesion of any kind, and little better than dry sand. The writer has had to deal with piers, thick walls, and other apparently solid masses of masonry in the work of church restoration, and in every case, without exception, the mortar of the hearting poured like water through any cracks or cavities made in the ashlar facings, when the bulk of the work was disturbed by settlement or otherwise. Lime, then, being at all times and in all places absolutely necessary to the making of building mortar, it becomes necessary to ask what is it? and what do we know of its properties? Lime was formerly called an alkaline earth, earth being a name given by chemists a century ago to certain non-metallic substances which were insoluble in water, and infusible at high temperatures. It was observed that lime possessed some of the properties of an alkali, for it neutralised acids and changed vegetable blues to green and yellow, so that, in addition to being an earth, it became an "alkaline" earth. Lime had two companions, the other alkaline earths, with properties almost similar to it, these were baryta and strontia: both are obtained in the laboratory as greyish-white powders, and, like lime, they readily combine with water, evolving intense heat, and forming substances known as hydroxides or hydrates. The heat evolved by baryta in combining with water is so great that the mass becomes incandescent. Up to 1808 chemists were well acquainted with these three alkaline earths, and believed them to be simple substances. In chemistry, a simple substance is one not made up of other substances; iron, for instance, is a simple substance, for by no conceivable process can it be made to yield anything but iron. Water is a compound substance, as may readily be seen by dropping the wires from any powerful electrical battery into it, when bubbles rise rapidly to the surface from the extremity of each wire. If these

are collected in separate glass vessels in the usual way, one will be found to contain oxygen and the other hydrogen. If these gases are again mixed, and a light applied to the mixture, they combine to form water; hence it is concluded that water is a chemical compound of oxygen and hydrogen. It is further observed that the gases obtained in this way invariably bear the same proportion to each other—viz., 1 part, by weight, of hydrogen to 8 parts of oxygen, and this same rule holds good for all chemical compounds, the substances composing them are combined in certain fixed proportions, and no other. The proportions, of course, vary for different compounds; but in the same compound the simple substances are always present in the same proportion. In passing, it is necessary to observe that a peculiarity of a chemical compound is that it is unlike any of its constituents, and possesses no property in any way common to them. Water, for instance, extinguishes fire; but one of its constituents is an inflammable gas, and the other a powerful supporter of combustion. From this it follows that lime mortar is not a compound, but simply a mechanical mixture. When, however, mortar begins to set changes take place in it, and compounds are formed which conform in every way to the definitions of chemical compounds given above; but, on the whole, lime mortar is a mechanical mixture of lime and sand, for these may be seen lying side by side in it, and they may readily be separated by mechanical means. So far, the consideration of this subject has necessitated the adoption of a few elementary definitions and simple laws of chemistry. As a knowledge of these is absolutely necessary to a clear understanding of what follows, it is of importance these should be repeated here as clearly and concisely as possible.

1. A simple substance, in chemistry, is one which cannot, by any known means, be decomposed into other substances. Chemists know about 66 such substances, and they are called chemical elements.

2. A compound substance is one which can be decomposed into two or more simple substances.

3. A compound substance possesses properties entirely differing from those of its constituents. Simple substances, water, for instance, extinguishes flame, whilst of its constituents, one supports combustion, and the other burns freely on a light being applied to it.

4. A compound substance cannot be resolved into its constituent substances by purely mechanical means. Heat, light, chemical action, or electricity is necessary for this purpose.

5. The chief distinguishing characteristic of a compound substance is that its constituent substances are invariably present in the compound in a fixed proportion by weight, and examples of compound substances may be increased indefinitely to prove the truth of this law, which may be stated briefly thus:—Chemical combination always takes place in fixed proportions. Why this should be so is not known. A consideration of the above leads to the conclusion that, although compounds may be decomposed into their constituents, and then again be made to recombine, there is no gain or loss of matter in either case; the quantity of it is fixed and unalterable, as the substances acted on merely undergo apparent change. Returning now to lime, we find that up to the year 1808 it was considered to be a simple substance. In that year Sir Humphrey Davy submitted a paste made of carbonate of lime to the action of a galvanic battery, and he discovered in this way that lime was a compound substance, the base of it being a metal, to which he gave the name of calcium. In fact, he decomposed the compound substance lime into its constituent simple substances, calcium and oxygen. Davy did not succeed in obtaining the metal in a coherent, metallic state; this was first done by Matthiessen in 1856. Until this time calcium was known as a white metallic powder. Calcium is now known as a whitish metal something like silver, tenacious, malleable, harder than lead, rusting or oxidising rapidly in moist air. It is a little heavier than water. When thrown on it the water is decomposed, and hydrogen evolved, which bursts into flame from the heat generated by the violence of the decomposition. Neither calcium nor its compound with oxygen, lime, is found isolated in nature; they are invariably in combination with other substances. Lime in combination with carbonic acid is found in huge deposits in rocks of all periods. Though the Lower Silurian rocks are

chiefly shales and slates, yet they contain beds of limestone, known as the Bala limestone, this is 50ft. thick in the Berwyn Mountains. Beyond Penmachno this limestone passes into nodular calcareous ash. The massive white and pink limestones of the Coniston group in the North of England belong to the Lower Silurian rocks. The Upper Silurian rocks, consisting chiefly of sandstones and shales, have also important beds of limestone. The Aymestry, Wenlock, and Woolhope limestones all belong to these rocks. The Aymestry limestone is about 50ft. thick near the place from which it takes its name. The Wenlock nodular limestone is about 340ft. thick at May Hill in Gloucestershire, and the Woolhope limestone is fully 150ft. thick at Malvern; so that in a series of rocks not remarkable for large deposits of carbonate of lime there are no less than three striking deposits, attaining in all a thickness of about 550ft.! The Devonian rocks contain beds of nodular impure limestone, which were at one time largely worked for agricultural lime. The limestones of Plymouth and Torquay belong to this series. The Carboniferous system is, however, that which *par excellence*, is remarkable for its limestone rocks;—under the coal measures and millstone grits of this series, they attain a thickness of upwards of 8,000ft.! In Ireland, these limestone rocks form more than one-half the entire surface of the country, covering it from sea to sea. The Permian rocks yield the Portland limestones, about 170ft. thick, the great and inferior oolites 350ft. thick, and the lias limestone beds, jointly about 1,300ft. thick, including the lias clays. In the next series of rocks—viz., the cretaceous, there are vast deposits of nearly pure carbonate of lime, such as the chalk, which is about 1,050ft. thick. The most recent rocks, those of the Hantonian system, have their limestones also in the Bembridge beds; these latter are remarkable for having supplied the limestone used in Winchester Cathedral. The limestones enumerated above are none of them chemically pure carbonate of lime, though chalk approaches more nearly to it than any of the others. They are all mixtures of carbonate of lime with sand, clay, and other matters, and in many instances the proportion of sand approaches so nearly to that of the carbonate of lime, that the stone may be classed either as a calcareous sandstone or sandy limestone, and when clay predominates, the rock may be termed an argillaceous limestone. In fact, the rock containing carbonate of lime may consist altogether of that substance, or contain it in such small quantity as to be practically a sandstone; the limestones, therefore, may gradually take up more and more of sand and clayey matter, until they cease to be correctly described as limestone at all.

Though some of the limestones differ much in texture and appearance, still, whether they are soft, pliable, and earthy as chalk, or compact and crystalline, as mountain limestone, chemically they are the same. Both these rocks contain about 94 or 95 per cent. of pure carbonate of lime. In colour the limestone rocks are white like chalk, cream like the oolites, and various shades of bluish-greys like the lias and mountain limestones. Limestone rocks are easily recognised: they may be scratched with a penknife, and they effervesce freely when treated with dilute acid. This effervescence indicates that the rock contains a carbonate, and this is generally found to be carbonate of lime. Nearly all the older limestones are coral reefs, scarcely altered in structure; these contain (fossilised, of course) the remains of marine animals imbedded in them. Our English chalk is very largely made up of the shells of Foraminifera, which shows that this immense deposit of carbonate of lime has been secreted from the water in which it was deposited by these tiny animals; in fact, all the pure or nearly pure limestones have been formed by the agency of marine animals. Impure limestones have been formed by the wearing down of the purer limestone into mud. This calcareous mud will in every case be mixed with other deposits, such as clay or sand, and the whole when thrown down on the sea bottom formed rocks like our lias and other limestones of a similar kind. But all pure limestones, so far as we know, have been formed by the agency of animals, and in no other way. All lime used for building purposes is obtained by calcination from rocks composed of carbonate of lime. The lime will, of course, be more or less pure as the rock from which it is obtained

is so; in other words, the purity of the lime will depend on the purity of the rock from which it is obtained. A pure carbonate of lime, like Carrara marble or Iceland spar, is a compound substance consisting of lime and carbonic acid, both compound substances in themselves. These may be resolved into calcium and oxygen, and carbon and oxygen. They are represented in chemical notation thus:—

Carbonate of lime	Lime	Calcium	40
		Oxygen	16
	Carbonic acid	Carbon	12
		Oxygen	16

The numbers represent the combining weights of the various simple substances, and may be read thus:—40lb. of calcium will combine with 16lb. of oxygen to form 56lb. of lime, and 12lb. of carbon will combine with twice 16lb. of oxygen to form 44lb. carbonic acid, the whole combining to form 100lb. of carbonate of lime. Nearly one-half the weight of any dry block of carbonate of lime is therefore carbonic acid. Quicklime is obtained by heating lumps of carbonate of lime to redness in an open fire or limekiln. Heat decomposes this carbonate, the carbonic acid passing off with aqueous vapour and the gases of the burning fuel, the residue being quicklime. It is necessary that the carbonic acid evolved during this decomposition be allowed to pass off, for if it is retained in the kiln the carbonate of lime may be fused without decomposition.

"BUILDING NEWS" DESIGNING CLUB.

A SUBURBAN RESIDENCE.

[WITH PHOTOLITHOGRAPHIC ILLUSTRATIONS.]

THERE could hardly be chosen a more suitable subject for the trial essay of a young architect than such a problem as this with which our present session was opened. It represents a class of building not only of the widest possible general interest, and at the same time well within the knowledge of most people, but usually the first commission intrusted to the would-be practitioner takes the form of a small house. It must not, however, on that account be supposed that the subject is quite so easy to master successfully as the unexperienced might think. Indeed, to secure the utmost amount of accommodation in a really inexpensive manner, and at the same time in an artistically effective and convenient way furnishes an exercise for the skill and patience of any architect, while it is evidently one in which not so very many men after all have distinguished themselves. That the average merit and interest of contemporary house-building has wonderfully improved of late years no one can deny, thanks to the artistic influence of such men as Mr. Norman Shaw and his school of art workers, but every town and village is still being deplorably disfigured by a vast quantity of ungainly, ill-contrived, and badly-built house property which possibly may make money for the speculator, but, in other respects, has no advantage for anyone. Every serious endeavour to show how commonsense requirements in everyday house-planning may be architecturally realised must always possess an interest and prove suggestively useful. This is all we venture to claim for the designs which we now give as the result of the opening contest among our Designing Club members, and we are prepared to admit that neither of the plans near perfection. The following are the conditions issued to the competitors:—

FIRST LIST OF SUBJECTS, 1897-8.

A.—A Suburban Dwelling-house, for a City gentleman, to cost £2,000. Economy of plan on a limited site are points of leading importance. The frontages are at the corner of two roads, facing south and west. The main road side of the plot measures 50ft., and has a return of 150ft. The elevation must set back 18ft. from the boundary fence on the main road side. A large dining-room or living-room is to take the preference over the drawing-room or parlour. A third sitting-room, not less than 12ft. square, is to be provided for a study or breakfast-room. That need not necessarily be on the ground-floor. A mezzanine arrangement is suggested. There must be six bedrooms in all; two of these may be attics. Bathroom essential, and two w.c.'s, besides kitchen and offices. There may be a small cellar. The entrance must be roomy but not wasteful, and the stairs not less than 3ft. 3in. wide. Materials brick, with stone dressings sparingly used. Roofs covered with tiles, style

optional. Size of rooms to be governed by the money expenditure. Drawings required: Three plans, two elevations, and a section scale 8ft. to the inch. Plans may be 16ft. to the inch; sketch view necessary.

We place "Centaur" first, "Pantile" second, the third place being assigned to "Petticoats." All three plans are herewith illustrated, and, perhaps, three more different schemes could scarcely be conceived. These are chosen out of the total number of 63 designs received for this subject.

"Centaur" is the author of a square, homely, unpretentious design, which at first sight some may style uninteresting, and, perhaps, even commonplace. This, in our judgment, would hardly be justified by a closer consideration of the three plans. Compactness of arrangement is of the first consequence, and particularly where a site is so restricted. The lobby at the entrance is a little too small, and is encumbered somewhat by the door opening on to that of the lavatory, and we are not so sure that a w.c. so close to the main entrance is not a mistake. Its window is so much in evidence; but if we locate it round the corner the balance in the composition of the entrance is lost. The hall is roomy, and the staircase is well out of view from the entrance. The kitchen is very much cut up by doors, and is none too large. The outbuildings, including a "bike" shelter, are thoughtfully made out, and do not necessarily intrude the domestics upon the enjoyable use of the little garden when the family are out there. The bedrooms open off a corridor, and all have fireplaces. The bathroom and closet are situate over the scullery, and a good cistern-room is managed above. The staircase-hall is tastefully treated. Economy has been well-considered, though we scarcely think £2,000 would pay the total cost.

"Pantile" wastes valuable space in passage, hall, and landing. He manages his study on the ground plan, and has two staircases. In these head room has not received that close attention which is needful. The ground-floor w.c., next the garden entrance, would be very low, and a tall man could not get up to the attics, as the section makes manifest. The top floor bedrooms are not actually so spacious as the plan indicates, owing to the slope of the roof timbers. The hipped roof on the side does not project enough for good effect from the front and rear gables. The design is pretty in some respects, and is broadly treated, considering a somewhat too evident attempt after the picturesque, which rather mars the building in our opinion.

"Petticoats" hardly does himself justice, and does not economise the superficial areas of his passages; but there is always a charm in a long, low, straight ridge-line. Here the uncertain manner in which the chimneys occur somewhat spoils the idea, and, considering the site has its narrow end facing the main road, it is more than likely that the reception-room bays would only have a second-rate prospect in the side road. The views seem to suggest a good view over a village-green. "Petticoats" makes a good third, but the author ought to do better things than this.

"By Go" we place fourth, but he is too fond of fanciful conceits, and strives after the symmetrical too evidently to do good work. Still, his plan has merits which we have not overlooked. He is not justified, however, in occupying the whole width of the site, and so making his tradesmen's door open directly from the pavement of the street. We do not like a flash style of draughtsmanship. It is misleading, and not artistic. "Dachs" is a woolly sort of draughtsman, using a too blue ink to reproduce well. We like his side elevation very well, with its two gables grouped together, but the ugly parapet over the eaves is as ungainly as it is unmeaning. The plan is in some ways good, but we do not like the built-in dark staircase, and the way in which the back and main staircase meet on one landing is a great objection. "Bantam" is more ordinary, and we see little to admire in his angle-set stone porch. Still, we think his drawing is marked by indications of better things by far than this maiden attempt. There is at present much room for improvement. "Byd" seems devoid of any sense of proportion in scheming his elevations, bald, bare gables coming over one-sided arrangements of bay windows, so that the gables seem as if their original openings had been bricked up, and other windows cut in afterwards. The plan is not good, and visitors would need finger-posts to enable them to find the main entrance. "And Co." draws but poorly, and plans but little

better; but there is a quaint idea about the grouping of his roof which deserves a note. The main bedrooms are, however, a little better than attics, and few City gentlemen would care to build such a house in the suburbs. "Gib" is not devoid of merit, but his plan shows little attempt to get away from the everlasting villa type. His perspective is brightly drawn, and the eaves give good shadows. "Turret" gives us a design which might pass muster for a bungalow, and the hall runs up on two floors most wastefully. Oddly enough, the main feature in the upper hall is the linen cupboard. The three gables on the return front are pretty, but "Turret" trifles with our judgment when he shows a carriage sweep in front of his entrance in the view while the plan indicates only a 5 ft. space. "Wessex's" elevation in front looks like a pair of conventional villas. "The Man in the Moon" breaks away from this type of thing, but overdoes his oversailing eaves a little too much for the style adopted. Not that we are inclined to fetter our students by limitations of mere style. Still, a sense of fitness demands some regard to association. In the plan the cellar stairway and kitchen look much too near the drawing-room door for the City gentleman's wife's comfort on "at home" days. "R. W. P." in a meaningless way, imitates the plastered 4½-brick wall style, with raking or battered chimney breasts and buttresses supposed to represent the massive rubble mode of old village buildings. To our taste this looks more like the sandpaper toy style of house-building more befitting to nursery books in illustration of the domicile of "Old Dame Trot." "Ard" draws in a coarse way which we cannot admire, and he makes his main front at the side, the garden entrance being towards the west. The tall chimneys look overdone. "Checkmate" is quiet and unambitious, giving us a building in what some would call the "Parsonage" style. There is little to find fault with, and not much to greatly admire. The author ought to do better before long if he will take good models as his guide. "Chameleon" makes a house which rather looks like a small public institution of quaint proportion and a pronounced eaves-line. The passage, which cuts the plans in half, is a very ungainly feature. "Orb" shines with no unusual brightness, and his design looks far too costly for the money limit imposed by our instructions. The plan is ingenious, and the grouping is picturesque. We shall expect the author to rank far higher another time. "Bonum Consilium" puts his doorway in the centre, and, after limiting himself by this common device, works out a somewhat convenient plan, nearly scoring a success, but his ground-floor windows, on which the façade so much depends, are not pretty, and the drawing is but indifferent. "Wen's" plans are far better than his elevations, though the ingle-nook in so small a hall is distinctly out of place. Externally, the building looks too much like two houses. "Ant" does not illustrate his design to any advantage, though here and there an artistic touch is discoverable. The breadth displayed in the design, for example, is welcomed, though the windows are too low and small for health and comfort. We shall look to "Ant" to contribute among the leading members of our club; but, to do this, better planning and better drawing will be needful. "Grip" draws with much neatness, and arranges his house with economy and care. His breakfast-room is contrived at a higher level than the ground-floor rooms, and so the author gets a cellar in a sort of half-basement; the way down to it, however, is immediately in view of the front door. The elevations are not very attractive; but they are simple and suitable for the money limit. "Klondyke" in some ways is more effective in respect to the external treatment, but his plan is far inferior. The author has not scamped his work, and we desire to urge him on in these competitions, for he does know how to try. "Kirby Hall" is the ambitious motto of another member who has clearly done his best, sending a well-considered plan with a kitchen nicely isolated, which is always a difficulty in a small house. His perspective spoils his design. "Spinningdale" comes next, and then "Hotspur," whose house looks very big for the money—a square Georgian building, uncompromisingly plain, gable one end, and hips to the roof at the other. "Ivy's" plan is roomy and square, with an inoffensive elevation. "Gossip" cramps his kitchen badly, and, externally, his bays are poor. "Vim" is ambitious, and so introduces an octagonal turret. He wastes space on the first floor meaninglessly. "Microbe" is another angle-tower man, favouring us with an

extinguisher-like roof. His living-room is not the chief apartment in the house as required by our conditions. "Eldon" knows the value of ample wall space, and shows a degree of quaintness which is noted, but his drawing leaves much to be desired; his hall is wasteful. "Spark" will not set the Thames on fire if he does not do better than this, though his plans have several points of merit, and his perspective is freely delineated, too freely to be vertical, in fact. Space prevents our enumerating more than the mottoes of the remaining designs, which we do in their order of merit:—"Phantom," "Strax," "Pup," "Bernard," "Don," "Solo," "Bull's-eye 5," "Bee," "Stone," "Olliwops," "Wun-hi," "Industry," "Chuckle," "Crow," "Spero," "Pen and Ink," "Cobden," "E. G.," "Auld Syne," "Hubert," "Derige," "Medusa," "Oak," "Nowhere," "Simplicity," "Eric," "Vita," "Spectator," "Chess," "Suburb," "Inexperienced," "Bow Bells."

THE STABILITY OF SOILS.

A MEETING of the Bristol Association of Engineers was held at the Queen's Hotel, Clifton, last week, under the presidency of Mr. H. W. Pearson, when Mr. A. P. I. Cotterell read a paper entitled "The Stability of Structures in Contact with Soil and Similar Material." He said his object was to bring forward a more accurate and scientific method than that generally followed of calculating the dimensions necessary for stability in structures in contact with soil and similar material, such as clay, sand, gravel, and, in fact, all substances that are capable of assuming an angle of repose. Having explained the ellipse of stress, he said by means of this ellipse certain fixed formulæ might be obtained applicable (1) for calculating the depth to which a wall or other structure must be carried to secure a stable foundation, (2) the thickness to which a retaining wall should be built to prevent its being overturned by the pressure of the soil. In the latter case the pressure would be found to vary according to the way in which the earth was sloped behind the wall, and the thickness must be varied accordingly, being greatest where the wall was surcharged by earth standing at a steep angle behind it. There were other conditions to be taken into account in designing foundations and walls, such as the compressibility of the earth causing a possibility of settlement, and in piled foundations the skin friction of the piles. The stiffness of retaining walls might also be increased by the use of counterforts which key back into the soil. All foundations should be at such a depth as to be safe from the effects of frost and drought. In cities the effect of closely-packed buildings was to increase the bearing power of the soil, and to render land formerly unfit to carry buildings sufficiently stiff to do so. It is a curious fact, explained by the ellipse of stress, that the soakage of oil into engine foundations was likely to make them settle. In designing both foundations and walls, the subsoil should be geologically studied, as a rocky base might easily have a softer stratum under it. Great interest attached to the tall buildings erected in America, some of these 20 and 22 stories in height. Those in Chicago were built upon the clay, the rock being at a prohibitive depth. The foundations were spread over as large an area as possible by means of steel joists imbedded in concrete so as to give a bearing pressure of not more than 4,000 lb. per square foot. Even with this, settlement of six or more inches was always expected, and the footings were constructed to allow for it. It would be found that when the ellipse of the stress was used for calculating walls and foundations, greater accuracy was secured, and there was far less chance of settlement.

AN ARCHITECT'S EXPERIENCES.*

AN autobiography is perhaps less appreciated by the reviewer than many others. It seems to defy analysis, because we cannot go behind an author's own personal mind and experience, and we can only deal with it as a narrative of impressions felt by one mind, and, therefore, not amenable to ordinary rules of criticism. Mr. Alfred Darbyshire, F.S.A., F.R.I.B.A., has written his experiences—pro-

fessional, artistic, and theatrical—and we must accept them as embodying the life and career of an architect in a large and varied practice in Manchester. Articled to Mr. P. B. Alley, of that city, at a time when there were few architects practising there, he had a good opportunity of acquiring a practical knowledge of the profession. The firm of Lane and Alley, a curious combination of names, had been well known as Classic architects of Manchester, and it was in this school that the author received his first impressions of architecture. While this firm tried to Classicise every building, Mr. Edward Walter, to whom is due the credit of introducing the Italian Renaissance, did much to foster a more appropriate and elastic style in the streets of Manchester, and many of his great warehouse façades are still pleasing examples of that revival. The Gothic Revival which followed was reserved for Mr. Waterhouse, R.A., and his followers. Mr. Darbyshire chats freely and pleasantly of friendships he formed at this period, and of the opening of the great Art Treasures Exhibition in Manchester of 1857; and it was here, he says, he became impressed with the beauty of the Pre-Raphaelite School, and formed pleasant relations with some of that brotherhood, and also with the late Lord Leighton, P.R.A., whose great picture of the "Procession of Cimabue's Madonna," hung in this Exhibition, and the influence of this wonderful art revival helped, he says, to shape out his "future line of art." During his pupilage our author became associated with many young men who have since become eminent in art, amongst them Arthur H. Marsh, now a member of the Royal Water-Colour Society, Joseph Knight, now a member of the R.I.P. Many well-known painters were connected with the Manchester School of Art and other local societies, and a good photo-block portrait of Frederick Shields, A.R.W.S., is given. Mr. Waterhouse, R.A., who commenced his career as a Gothic architect in the "fifties," is not overlooked. Mr. Darbyshire's professional work in enlarging the Prince's Theatre, for the late Mr. Calvert, was the beginning of his connection with theatre construction and the art of the stage, and several chapters are devoted to this subject. The author's plans for the Manchester abattoirs, which were successful, are described; also his work at the Lyceum for Sir Henry Irving, and his connection with this theatre brought our author into contact with many illustrious persons; but we must skip many interesting chapters, in which the author refers to many incidents of his professional life, and notably his theatrical experience, safe theatres, and the art of the stage. Mr. Darbyshire touches on a host of incidents and reminiscences, historical, political, and artistic. His connection with stage architecture, his remarks on the Shakespearian drama, the acting of Calvert, Sir H. Irving's rendering of "Hamlet," and the old and modern styles of acting will be read with interest by many for their genial reference to many notabilities of the past and present.

At Tuesday's meeting of the urban district council for Smethwick, attention was called to the large increase in the number of houses in the parish. Mr. T. Potter (Chairman of the Buildings Committee) said the committee had recently passed plans for the erection of 126 houses, and there were about 260 or 280 houses now in course of erection.

Mr. James Green, the arbitrator in the claim for reinstatement brought by Messrs. Gratrix against the Great Northern Railway Company in respect of the demolition of their premises in Alport Town for the purposes of a new goods station in this city, has fixed his award at £56,622. Taking the whole of the various items presented by Messrs. Gratrix, the claim in round figures amounted to about £111,600.

At the meeting of the Bristol Town Council on Tuesday, it was decided to borrow £10,000 for the purpose of extending wood paving to certain streets. Mr. Yabbicom was appointed district surveyor under the Bristol Improvement Acts, and it was resolved that, from Dec. 31, surveyor's fees on buildings which had been chargeable under these Acts should be abolished. Upon this point a memorial was presented from the Bristol Master Builders' Association, and Alderman Proctor remarked it was not often that one was able to return so ready an answer to the requests of memorialists. It was, after a long discussion, decided to increase the salary of Mr. Yabbicom from £500 to £800, and afterwards, by yearly instalments of £100, to £1,000 per annum. Mr. Ashmead's services will be retained as consulting engineer at a salary of £500 a year.

* An Architect's Experience: Professional, Artistic, and Theatrical. By ALFRED DARBYSHIRE, F.S.A., F.R.I.B.A. Manchester: J. E. Cornish.

THE LATE MR. JOHN L. PEARSON, R.A.

THE rapidly dwindling school of Gothic Revivalists has lost its most distinguished exponent, by the death, at the age of fourscore years, of Mr. John Loughborough Pearson, R.A., F.S.A. The eminent ecclesiastical architect, whose decease will be widely regretted in the profession, had only been ill a week, and passed away at his residence and office, at 13, Mansfield-street, W., on Saturday. Mr. Pearson, whose portrait we gave in our issue of Jan. 3, 1890, was born in Brussels on July 5, 1817, being the youngest son of William Pearson, water-colour painter, of Durham. At the age of 14 he was articled to Ignatius Bonomi, architect, of the latter city, and, after spending a short time with Anthony Salvin, he became an assistant to Philip Hardwick, R.A. In his last years in that office, 1843, Hardwick was erecting the hall of Lincoln's Inn, and Mr. Pearson was engaged both upon the drawings of that building and the superintendence of its execution. The same year he commenced private practice, and the Rev. C. Townsend (in whose Sunday School at St. Margaret's, Durham, he had been superintendent for two years) intrusted him with the designs for a small new church, St. Ann's Chapel, Ellerker, East Riding. Some signs of the individuality, power, and grasp of Gothic details and grouping which afterwards distinguished Pearson's work are to be seen in this little building, consisting as it does, but of a nave, chancel, and south front, the west-end wall only pierced by a pair of lancets, and surmounted by a simple bellcote. Other small churches were built from his designs at Elloughton and Ellerton, and a somewhat larger one at North Ferriby; while seven or eight churches in the immediate neighbourhood on the banks of the Humber were restored under his supervision. In 1850 he commenced for Archdeacon Bentinck the church of Holy Trinity, Bessborough Gardens, Vauxhall Bridge-road. In all its details it is a conventional rendering of the Decorated style, but makes a new departure in plan, in the chancel being of greater width than the nave. This church gained him encomiums from Barry, Pugin, and Scott, the latter declaring it to be "the best modern specimen of a 14th-century English church." Pearson's style was profoundly affected by the publication of Viollet-le-Duc's "*Dictionnaire Raisonné d'Architecture*," and henceforth his work depended largely for effect on strong lines and broad proportions, with a sparing use of modified Early French detail, but in later years there was a partial return to English features. Following on his schools for St. Peter's, Vauxhall, noteworthy as the site of the first memorial-stone laid by the Prince of Wales, he designed for the present dean of St. Paul's, Dr. Gregory, the church itself—the first modern example of a brick vault on stone ribs, and a treatment he subsequently adopted for all his larger churches. Before he received the commission for St. Peter's, Vauxhall, he had been induced to study very carefully the principles of Gothic vaulting during the restoration of Stow Church in Lincolnshire. Here the vault had fallen, as the unbuttressed walls were not able to withstand its thrust. Mr. Pearson surmounted the difficulty by building the lower part of the groin in solid courses, with horizontal beds, so forming a counterpoise of sufficient weight to withstand the thrust of the arched vault. The discovery of this mechanical contrivance greatly influenced his subsequent designs, as by its aid he was able to build vaults of wide span without the assistance of the great arched buttress which is so conspicuous a feature in French churches, and so apparently defying the law of gravity. Among other early works were Ireberfydd House, South Wales, and Quar-wood, Gloucestershire. In 1870 he was appointed architect to Lincoln Cathedral, and in the following year he designed the great church of St. Augustine, Kilburn, the most important of his parish churches, and now being completed by the erection of the great tower and spire. The well-known church of St. John the Evangelist, Red Lion-square, another plainly-treated 13th-century design, carried out in red brick with slate roof, followed, and at somewhat later periods, St. Michael's, Croydon, St. John's, Upper Norwood, and St. Alban's, Birmingham—all cruciform, vaulted, brick churches, with aisles and side chapels, and simply-treated fenestration. He also carried out Headingley Church, near Leeds, with its two unequal aisles and a tower and spire carried on detached piers within the nave, and rising to

200ft. in height; St. Stephen's, Bournemouth; St. Agnes', Toxteth Park. Among domestic buildings may here be named Lechlade Manor House; the reconstruction of Westwood, Sydenham (a Renaissance building); Lord Armstrong's Northumbrian seat, Craigside; and St. Peter's Convalescent Home, Woking.

On the death of Street he was appointed architect to the Dean and Chapter of Bristol, and has completed the nave of the cathedral, with its western towers, and also designed the new reredos. He was also architect to Rochester and Chichester Cathedrals, and was at the time of his death engaged in preparing a design for rebuilding the north-western tower to the latter fabric, while his report for the eastern extension of Wakefield Cathedral Church as a memorial to the late bishop, Dr. Walsham How, appears elsewhere in our columns. He was also consulting architect to Exeter and Gloucester, and was one of the consulting architects to the Church Building Society. His successful and careful work in the conservation of Peterborough west front, and the newspaper controversies the resetting of the masonry gave rise to, will be fresh in the recollection of our readers, and, unlike many of the earlier Gothic revivalists, he never allowed himself to be entangled in public correspondence, nor replied to the oftentimes obviously unfair and ill-informed criticisms upon his work.

His great memorial will, however, be the new Cathedral at Truro, where, even in its present unfinished condition, his success in dealing with the difficulties of the plan arising from the retention of the old parish church as a south aisle, is very striking. On May 20, 1880, the foundation-stone of Truro Cathedral was laid by the Prince of Wales, and on November 3, 1887, the first portion of the building was consecrated. At present the central tower just shows above the roof, and only two bays of the nave have been completed, though the foundations of the nave have just been put in as the beginning of a memorial to the late Archbishop Benson; but the design includes a central and two western towers and spires, an octagonal chapter-house, and a small, irregular cloister.

Among his other works must be named the restoration of the upper part of the north transept of Westminster Abbey, the doorways having been previously restored under Sir Gilbert Scott; the renovation of the south aisles to nave and choir; the alterations to Westminster Hall, completed in 1884; and the new wing to University Library, Cambridge, built two years later, and additions to the colleges of Sidney Sussex and Emmanuel in the same university town. Besides these he carried out a large number of vicarages and schools, as well as many mansions, country seats, and private residences. His latest works are the charming Astor Estate Office at the foot of the Temple steps, on the Embankment; a cemetery chapel at Malta; the Catholic Apostolic Church at Maida Vale; a rood screen and chapel at All Saints', Maidstone, a 15th-century collegiate church he restored a dozen years since; and All Saints' Church, Hove, which we shall illustrate in an early issue.

Mr. Pearson, who had long been a Fellow of the Society of Antiquaries, became an Associate of the Royal Academy in 1874, and a Full Member in 1881. He joined the Royal Institute of British Architects as a Fellow in 1860, being No. 39 on the present roll of membership, and in 1880 received the distinction of the Royal Gold Medal, a year when he was serving on the council of that body. At the Paris Exhibition of 1878 he was awarded a gold medal and the knighthood of the Legion of Honour.

He married in 1862 Jemima, youngest daughter of Henry Curwen Christian, who died three years later, leaving an only son, Mr. F. L. Pearson, who follows his father's profession.

The funeral took place at noon yesterday (Thursday) in Westminster Abbey, for so many years under Mr. Pearson's care, and was very numerous attended by professional colleagues and other friends. The first part of the service was held in the choir, and was fully choral. After Schubert's Solemn March had been rendered on the organ by Sir F. Bridge, the well-known sentences of the Burial Service were sung to Purcell's chant by the choir, and the funeral procession then moved forward into the space under the lantern, while the Lesson was read from the altar steps by Canon Duckworth. The chief mourners were Mr. Frank L. Pearson (son) and Mr. Henry Christian (brother-in-law), Mrs. Christian and daughters.

The coffin, a massive one of oak, with a cross on the ledger lid, bore the inscription: "John Loughborough Pearson, R.A., Surveyor of the Fabric, Westminster Abbey. Born July 15, 1817. Died December 11, 1897." It was almost laden by wreaths and offerings of flowers. The pall-bearers were the Bishop of St. Andrew's (Dr. G. Howard Wilkinson, second Bishop of Truro), Sir Edward J. Poynter, P.R.A., the Right Hon. George Shaw-Lefevre, M.P., Mr. Alfred Waterhouse, R.A., L.L.D., Professor George Aitchison, A.R.A., P.R.I.B.A., the Dean of Peterborough (Dr. W. Clavell Ingram), the sub-Dean of Lincoln (Rev. J. Clements), Sir Arthur W. Blomfield, A.R.A., and Mr. T. G. Jackson, R.A. Among those present in the choir and transepts were Sir W. B. Richmond, and Messrs. W. J. Yeames (treasurer), H. H. Armstead, Thomas Brock, F. Goodall, W. W. Oulless, R. Norman Shaw, Hamo Thornycroft, J. W. Waterhouse, and H. T. Wells, Royal Academicians, and Mr. F. A. Eaton, secretary, representing the Royal Academy; Messrs. H. L. Florence, Alexander Graham, E. A. Gruning, and Aston Webb, vice-presidents, James Brooks, past vice-president, William Emerson, hon. secretary, and W. J. Locke, secretary, a deputation from the Royal Institute of British Architects; Mr. G. B. Carvill (formerly in Mr. Pearson's office) and Mr. B. Flight Fletcher, representing the Architectural Association; Mr. J. P. Seddon and the Rev. R. M. Blakiston on behalf of the Incorporated Church Building Society, and Messrs. R. Phené Spiers, F.S.A. (of the Royal Academy Schools), W. D. Caröe, F.S.A. (former assistant), J. A. Gotch, F.S.A., E. T. Hall, John Slater, Paul Waterhouse, C. Forster Hayward, F.S.A., Professor T. Roger Smith, William White, F.S.A., L. Stokes, H. P. Burke-Downing, Alex. Payne, John Norton, J. J. Stevenson, Lacy W. Ridge, and T. H. Watson and other architects; Mr. H. C. Richards, M.P., Mr. Wright, clerk of works at the Abbey, and among the clergy there were Canons Furze, Wilberforce, and Gore, and the precentor, the Rev. Dr. Troutbeck, by whom the musical arrangements were conducted. The Lesson having been impressively read by the sub-dean, Canon Duckworth, S. S. Wesley's anthem "All Go to One Place" was rendered by the choir, and the procession was reformed and returned through the choir to the nave, where on the south side, close to the pulpit, a wide space on the floor had been draped with black and white cloth, containing the grave space in the centre. The site is close to the resting-places of Mr. Pearson's immediate predecessors in office—Sir G. Gilbert Scott and George Edmund Street. Here the concluding portion of the service was read by the Dean, Dr. Bradley, and the body having been reverently committed to the grave, Dyke's well-known hymn, "Now the Labourer's Task is o'er" was sung, and the benediction having been pronounced, the familiar strains of the Dead March in *Saul* pealed forth from the organ.

On Saturday Lady Evelyn Cavendish laid the foundation-stone of a new church at Flockburgh, Lancs. The new building will accommodate 650 persons, will be Early English in style, and is estimated to cost £8,000. Messrs. Paley and Austin, of Lancaster, are the architects.

New business premises are in course of erection in Moor-street, Birmingham, for Messrs. Coleman and Oldland, wholesale clothiers. The architect is Mr. John Statham Davis, of Cobden Buildings, Corporation-street, and the contractor Mr. William Hopkins, of Thorpe-street, both of that city.

A family memorial has been placed in the east window of the chancel of Ellerker Church, Brough, by Mr. N. M. Levitt to the Marshall and Levitt family, designed and executed by Mr. T. W. Camm, of the studio, Smethwick, near Birmingham, the subject being the Ascension, which occupies the whole of the three lights and tracery.

The members of the Scarborough Master Builders' Association dined together at the Albemarle Hotel, on Wednesday evening. The chair was occupied by the president, Councillor Bland. After the loyal toast, that of the "Builders' Association" was proposed by Mr. Sinclair, and responded to by the chairman. The "Town and Trade of Scarborough" was proposed by Mr. Peckett, and responded to by Mr. Abraham Moore, who dwelt on the extensive improvements which had been carried out, and the growth of the town, which had been largely assisted in its development by the builders present. Songs were sung by the members present accompanied by the secretary of the association, Mr. R. H. Carr.

THE LONDON SCHOOL OF MEDICINE FOR WOMEN.—ENNISKILLIN TOWN HALL.—THIRD PREMIATED DESIGN FOR THE BURY FREE LIBRARY AND ART GALLERY.—DESIGNS FOR A SUBURBAN RESIDENCE.—STAIRCASE AND HALL IN HOUSE AT BERLIN.

Our Illustrations.

LONDON SCHOOL OF MEDICINE FOR WOMEN.

THE school has been established in Handel-street, Brunswick-square, for about 25 years, and, from comparatively small beginnings, has gradually increased in size and importance till it has outgrown its present accommodation. New premises have, therefore, become necessary, and the Council have begun the entire rebuilding of the school on its present site. When completed it will form three sides of a quadrangle, the principal entrance being in Hunter-street. On this, the west side, will be the hall and staircase, the boardroom and secretary's office, the students' common-room, and refectory; the Anatomical and Materia Medica Museums, the Pharmacy and other Classrooms, with the caretakers' and servants' rooms and kitchen in the basement. On the south side are the students' general cloak-rooms and dressing-rooms, the Biology Laboratory, the Library, and Lecture Theatres. On the east side are a series of Laboratories for physics, chemistry, physiology, and anatomy; this latter block is being erected first, and is now being roofed in. The contract has been taken by Messrs. Holloway Bros., of Victoria Works, Battersea. The materials used externally are red-facing bricks, with Portland stone dressings, and red tiles for the roofs. Internally, the several laboratories will be fitted and furnished with all the latest appliances for their special purposes, so that, when finished, it is hoped the institution will be one of the most completely and thoroughly equipped schools in London. It has been designed, and is being carried out, under the superintendence of Mr. J. M. Brydon, architect.

NEW TOWN HALL, ENNISKILLEN, CO. FERMANAGH: SELECTED DESIGN.

THIS is the design which was placed first in the recent competition for a new town-hall at Enniskillen. The building is now in course of erection. Accommodation is provided for the usual municipal offices, comprising council chamber, clerks' office, and chairman's room or Mayor's parlour, borough surveyor's and collectors' offices, and a public reading-room and book store. There is a large assembly hall for public entertainments, with stage and dressing-rooms, having separate lavatories, and another hall for smaller gatherings. Lavatories are provided on the different floors. The staircase will be of marble, and the floors of the entrance halls and corridors of iron and concrete, finished with Stuart's granolithic. The external face of walls is of Carrick-Creagh limestone, with dressings, cornices, &c., of Dungannon sandstone. The roofs are covered with Westmoreland slates, and the domes of tower and vent flèche with copper.

Messrs. Anthony Scott and Son, of Drogheda and Navan, are the authors of the design, under whose superintendence the works are being carried out by the contractor, Mr. James Harvey, of Enniskillen.

BURY ART GALLERY AND PUBLIC LIBRARY: THIRD PREMIATED DESIGN.

WE have already illustrated the selected design, as well as that for which the second premium was awarded. To-day we give the view and plans of Mr. John Johnson's design, to which the third prize was given. The plans display a practical knowledge of the requirements conveniently worked out with a careful reference to ample lighting, as well as a squareness of proportion which looks straightforward and is easy of administration. The perspective accompanying the plans will enable our readers to compare the relative attractions of the three premiated designs by placing all three views side by side. The first prize drawings appeared in our pages on the 3rd inst., and the second prize plans were published last week.

"BUILDING NEWS" DESIGNING CLUB: A SUBURBAN RESIDENCE.

For description and awards see p. 864.

STAIRCASE HALL IN A BERLIN HOUSE.

THE sketch which we give this week shows the picturesque treatment of a staircase in a house situated in the Fassenstrasse, Berlin, by Herr Hans Grisebach, architect. The balustrade to stairs and landing above is richly-carved with panels of cupids and dolphins, &c. The dado round hall is elaborately decorated, and near the door to the left a wooden statue of the Virgin and Child is attached to the wall.

CHIPS.

At the Workington Town Council on Tuesday night a resolution was passed pledging the town to subscribe £150,000 towards the making of a deep-water dock. This is an addition of £50,000 to the resolution carried on November 25, and has been found necessary owing to the increase in the estimates.

The benediction of the church-house for Old St. Pancras, which has been built from plans by Mr. C. R. Baker King, of Spring-gardens, took place on Saturday last.

The Archbishop of York on Saturday consecrated St. Peter's Church, Bentley, which has been erected at a cost of about £10,000, contributed by Mr. C. E. S. Cooke, of St. Catherine's, Doncaster.

Peterhead Town Council, at a private meeting on Monday night, had under consideration a recommendation of the finance committee that Mr. Geils, burgh surveyor, be asked to resign office within three months. There was practical unanimity in adopting the course suggested by the finance committee.

On Friday a special meeting of the Poole Town Council was held to consider a report from the sewerage committee relative to the stoppage of the sewerage works consequent upon the determination of the contract with Mr. Reeks. The committee recommended the council to invite tenders for the execution of the unfinished work, and this was agreed to.

The Berkhamstead Rural District Council having applied to the Local Government Board for sanction to borrow sums of £7,814 and £3,186 for purposes of sewerage and sewage disposal for the parishes of Berkhamstead and Northchurch, an inquiry was held last week by Mr. George W. Willcocks, M.L.C.E., accompanied by Mr. Boulnois, in reference to the application. Some opposition was raised to the proposed outlay.

Mr. A. Bowes, of the borough engineer's office, Salford, has been appointed surveyor to the urban district of Newton-in-Makerfield, out of a large number of applicants.

Colonel Yorke, as representing the Board of Trade, on Saturday made an official inspection of the extensions which have recently been made on the Edinburgh tramway system (1) from the railway bridge at Coltbridge to the burgh boundary at Corstorphine; (2) from the Suburban Railway bridge at Gorgie-road as far as Balgreen-road; (3) from the Braid Hills Hotel to the golf course cross-road; and (4) the Craigmillar extension. The engineers, Mr. Cooper and Mr. W. M. Colam, were in attendance.

The Queen of Italy is about to assist materially Italian science by having an observatory built on the summit of Mont Rosa, 14,820ft. above the level of the sea. This observatory will be the loftiest in the world.

COMPETITIONS.

BATTERSEA.—New public baths and wash-houses are to be erected in Battersea Park-road, and, from the 15 designs submitted in competition, the plans of Mr. Francis J. Smith, F.R.I.B.A., of Westminster, have been chosen. The excellence of this plan is undoubted. The second premium has been awarded to Mr. J. Hatchard Smith, of Moorgate-street; and the third place is taken by Mr. A. Hessel Tiltman, of Bedford-row. The three premiated designs are to be on public view at Battersea.

HARRISBURG, PENNSYLVANIA.—It will be remembered, says the *American Architect*, that six architects were specially invited to submit designs in the recent competition for the Harrisburg Capitol, and were promised, in consideration of their doing so, compensation to the extent of 1,000dol. each. This compensation is to be withheld from five of the six architects in question, on the ground that, as their designs could not have been executed, without modification, for 550,000dol., they have violated their part of the contract, and are not entitled to require from the State performance of its part. The sixth competitor, whose design could, it is claimed, have been carried out for the sum mentioned, and will, therefore, receive his 1,000dol., is the one whose drawings were excluded from competition by the experts, on account of their violation of the terms of the programme. The Capitol Commissioners have further refused to pay the expert jurors the agreed compensation for the time and trouble which they expended in examining and reporting upon the competitive designs.

PLYMOUTH.—The prize offered by Mr. C. King, chairman of the Three Towns Branch Devon and Exeter Architectural Society, to students of the branch for the best measured drawing of any, or part of any, building, has been awarded to Mr. R. Sims Baker, of St. Blazey, Cornwall, and until lately a pupil of Mr. B. Priestley Shires, A.R.I.B.A., of Plymouth, for his drawing of part of Plympton St. Mary Church. Mr. H. F. Roskrugs, a pupil of Mr. H. G. Luff, A.R.I.B.A., of Devonport, obtained second place for his drawing of Maker Church.

The plans of the proposed alterations and additions to the Royal Opera House, St. Leonard's, prepared by Mr. John P. Briggs, of Effingham House, Arundel-street, Strand, have been passed by the Hastings Town Council.

Excellent business was done at the Auction Mart last week, the aggregate realisation amounting to £138,908, and the properties disposed of being of very varied descriptions. Prices were firm, as has, in fact, been the case for some time past. It is now safe to say that 1897 will produce a better record than 1896, although that was a good year.

The parish church of St. Mary Magdalene, Gedney, was reopened last week in the presence of the Bishop of Lincoln, after restoration at a cost of £2,000. The architect has been Mr. W. D. Caröe, F.S.A., of Whitehall. The roof of the nave and north aisle has been released throughout, the floors replaced by wood blocks laid upon concrete, the old high pews removed, and the upper part of the tower arch opened out. The work of repair and preservation has been going on for fourteen months.

At the meeting of the parishioners of St. Sepulchre, E.C., on Friday, it was announced that her Majesty's Judges had expressed their intention of approving the plans submitted by the Corporation of London for the erection of a new central criminal court, and the work of demolition would then proceed at no distant date to make way for the new building. The delay has been caused by an endeavour to retain the corner piece facing Giltspur-street as a stronghold for the City of London in the event of any future rioting. It has now been decided to agree to the removal of the portion of the prison referred to, so that the buildings might the more speedily be taken down.

At the last meeting of the Barton board of guardians the workhouse extension and building committee reported that a sum of £30,000 would be required to complete the union hospital at Patricroft. In March, 1896, it was estimated that the sum required for the uncompleted works at the new workhouse would be £15,194. The building committee had been informed by the architect that the price of labour and material since that date had increased by 33 per cent., and this would involve an additional outlay of £5,065. The alteration in the plans made by the Local Government Board, and the extra buildings required to be erected, would necessitate the expenditure of a further sum of £8,320, making a total of £28,579.

Building Intelligence.

ASTON.—A higher-grade school is about to be built at Aston. The general arrangements consist of a school for 280 senior boys and 280 senior girls in separate departments, with two teachers' rooms to each department. A chemical laboratory for 50 scholars and a physical laboratory, also for 50 scholars, are provided. A gymnasium is also to be built. The style is 17th-century Renaissance. The main hall is carried up two stories, forming the central feature of the design. The materials will be red brick and terracotta, with tiled roofs. The estimated cost (exclusive of site and furnishing) is about £12,000. The architects are Messrs. Crouch and Butler, of Waterloo-street, Birmingham, whose designs were placed first in order of merit by Mr. E. R. Robson, F.S.A. In this competition, just decided, the design by Mr. Edward Holmes was awarded second prize, and that of Mr. John G. Dunn third.

CANTERBURY.—A sanatorium was opened on Thursday in last week, from plans prepared by the city surveyor, Mr. A. H. Campbell. It is upon the pavilion principle, each separate disease having a distinct block. The blocks number six in all, and consist of scarlet fever pavilion, 12 beds; typhoid fever pavilion, six beds; diphtheria and isolation pavilion, two beds; administration block for matron and nurses, eight beds; giving a total of 28 beds, inclusive of matron's and staff accommodation. Besides these there are the laundry block and discharging block. The heating and ventilation are conjoined, and were executed by Messrs. E. H. Shorland and Bro., of Manchester, so that the fresh air admitted to the wards is warmed on its inflow. The walls are plastered, with distempered finish, while relief is imparted to the plain wall surface by fresco art subjects, executed by the students of the School of Art, under the supervision of the headmaster (Mr. Allen). The floors of the wards are laid with pitch-pine wood blocks by Mr. J. F. Ebner, of London. The building contract has been executed by Messrs. George H. Denne and Son, of Deal.

HIGH WYCOMBE.—The foundation-stone of a new Conservative club in the High-street of this town was laid on Friday, Dec. 10 last, by the Right Hon. A. J. Balfour, First Lord of the Treasury. The building is to be of Late Gothic style, in brick, stone, and tile, having a frontage of about 26ft. to the main street. On the ground-floor are provided large smoking-lounge and bar, with steward's-room, lavatories, and offices in the rear; on the first floor reading-room, lofty billiard-saloon for two tables, and committee-room, and on the second floor five rooms and offices for steward's residence. The cost of the site and building will be about £1,600, and the contract for the building has been given to Mr. G. H. Gibson, of High Wycombe, at £925. The architect is Mr. Arthur Vernon, of 29, Cockspur-street, London, and Wycombe.

WAKEFIELD.—A meeting of the subscribers to the Walsham How Memorial Fund was held at Wakefield, last week, to consider the proposed enlargement of the cathedral as a memorial to the late Bishop. A report was read from Mr. J. L. Pearson, R.A., that "the chancel, as it is at present, while possibly sufficient for the wants of a parish church, is lacking in the importance and dignity, and also in the accommodation, necessary to a cathedral. Briefly, the design may be described as follows:—The extension of the chancel eastward, besides giving the increased length to the choir which it so much needs, provides also a retro-choir—a characteristic feature of our English cathedrals. Approached from the retro-choir, and forming a continuation of it, a chapel is obtained, which, together with the retro choir, will give ample accommodation for early and occasional services. The total extension eastwards amounts to 60ft. The chancel aisles are extended eastwards to the same extent as the retro-choir, and this extension takes the form of north and south transepts with eastern aisles. By means of these extensions there is ample room beneath for the chapter-house and complete vestry accommodation, which, owing to the natural slope of the ground, will be well lighted. The extension of the chancel admits of the altar being moved one bay eastward. By this means considerable additional space is obtained. Behind the altar, and dividing the choir from the chapel,

would be the altar-screen. Under the arch on the north side of the sanctuary I propose to place the canopied tomb, with the recumbent effigy of the late Bishop, where it would occupy the position often filled by the founder's tomb. On the south side, opposite to this, would be the sedilia and credence. I propose to take away the existing movable front row of seats and book boards at which the choir sit, and so expose to view the whole of the canons' stalls, a large portion of which are old. The cost of the alterations and additions, and the works consequent on them, may be put down approximately as follows:—structure, £13,500; heating and lighting, £600; bishop's tomb, including recumbent effigy, £2,500; stalls for choir, £400; altar-screen, £1,500; sedilia and side screens, £800; marble floor for sanctuary, £350; bishop's throne, £650; altar, £100; chapel fittings, £300 (£20,700). The report was adopted, and it was decided to appeal for subscriptions, about £1,200 being subscribed in the room.

CHIPS.

The technical school at Dewsbury is about to be enlarged, from plans prepared by Mr. John Lane Fox, of that town.

Mr. F. A. Winstanley, deputy engineer, Newcastle-under-Lyme, was last night appointed manager of the Rotherham Corporation Gasworks at a commencing salary of £200, rising to £300 a year.

The scaffolding and hoarding have now been removed from the first portion of the new building being reared for the Young Men's Christian Association in Blackett-street, Newcastle-on-Tyne. The architect is Mr. J. W. Taylor, of Westgate-road, Newcastle.

Plans of the new Opera House, shops, warehouses, &c., which are to be erected in Mount Pleasant-road, Monson-road, and Newton-road, Tunbridge Wells, have been passed by the works committee of the corporation. The plans have been prepared by Mr. John P. Briggs, Eflingham House, Arundel-street, Strand, and provide seating accommodation for 1,500.

A general meeting of the shareholders of the Sheffield Athenæum was held on the 7th inst., at the Athenæum Club, George-street, Sheffield, for the purpose of considering a proposal to pull down the present premises and rebuild them. The directors of the company some months ago purchased additional land in George-street, adjoining the club premises, and Messrs. Flockton, Gibbs, and Flockton have prepared plans for building on the enlarged site. The plans are for a brick building, with stone dressings, and the building and furnishing will probably cost about £10,000. The plans were approved.

The directors of the Law Life Assurance Company, Fleet-street, in consideration of being allowed to extend their premises—formerly St. Dunstan's Rectory—on the vacant site west of the church, have undertaken to build, at a cost of more than £3,000, a new rectory house on the piece of ground east of the church and in front of the parochial schools.

At Probus Church, Cornwall, a new chancel-screen, incorporating old work, was dedicated on Friday. The work has been carried out from a design by Messrs. St. Aubyn and Wadling. The existing work was constructed by the late Mr. G. E. Street, R.A., when the church was restored in 1851, and is composed mainly of old oak carved bench-ends, with modern circular tracery panels, and moulded capping over, and of the remains of the door and other posts of an ancient screen. The date 1591 is on one of the panels. The addition, to the height of 8ft. above the old work, consists of three bays on each side of the doorway, with heads of tracery and carving of Perpendicular character and varied design, a tracery head, carved cornice, and surmounted by bradishing. The total height of the screen as completed is 12ft. 3in. from the chancel floor.

A proposal of the Fire Brigade Committee of the London County Council that certain work in altering and enlarging the Hampstead fire station be entrusted to the Works Department at the estimated cost of £4,900 was rejected by 47 to 45 votes in favour of an amendment referring back the recommendation with instructions to the committee to advertise for tenders.

At the last meeting of the Edinburgh water trust the works committee reported that they had opened ten estimates for laying the new main from Gillygubedean to Alnwickhill, the work being divided into two sections. That of Messrs. James Young and Sons, amounting to £9,812 12s. 1d. was accepted, and it was resolved that in the mean time only the first section of the work, amounting to £4,779 14s. 9d., should be proceeded with.

Engineering Notes.

SOCIETY OF ENGINEERS.—The forty-fourth annual general meeting of the Society of Engineers was held on Monday last at the rooms of the Society, 17, Victoria-street, Westminster, S.W. The chair was occupied by Mr. George Maxwell Lawford, President. The following gentlemen were duly elected by ballot as the council and officers for 1898—viz., as President, Mr. Wm. Worby Beaumont; as vice-presidents, Messrs. John Corry Fell, Henry O'Connor, and Charles Mason; as ordinary members of council, Messrs. James Patten Barber, Joseph Bernays, George Burt, David Butler Butler, Percy Griffith, Richard St. George Moore, Nicholas James West, and Maurice Wilson; as hon. sec. and treasurer, Mr. Perry Fairfax Nursey; as hon. auditors, Messrs. Alfred Lass, F.C.A., and Samuel Wood, F.C.A. The proceedings were terminated by a vote of thanks to the President, council, and officers for 1897, which was duly acknowledged by the President.

Two men (James Reid and John Wilson) were killed and three injured by the falling of a scaffold at Ayr Town Hall on Tuesday. The hall was gutted by fire on July 1st, and the men were engaged in demolishing the walls. Mr. George Wilkie, the contractor for the work, had a very narrow escape from death.

A syndicate of Newcastle gentlemen have purchased a large estate in the neighbourhood of Abbey-road, Barrow-in-Furness, where they intend to commence building semi-detached villas and a good class of self-contained houses. The architects for the estate are Messrs. Watson and Curry, 18, Grainger-street, Newcastle, who will lay out the land.

One of the large nave windows of Airmyn Church, Goole, has just been filled with stained glass by Mrs. Arthur Speer, in commemoration of her wedding. The window contains figures of Ruth and Naomi, surrounded by suitable ornament, and is from the studio of Messrs. Powell Brothers, of 30, Park-square, Leeds. The Bishop of Hull unveiled the window at a special dedicatory service.

In connection with the additions to the Royal Infirmary, Sheffield, Messrs. Powell Brothers, of Leeds, have just completed stained glass for the large staircase window to the eye-wards. The subjects in the lower panels are "Our Lord Healing the Blind," and "Tobit and the Angel," and the upper panels are filled with foliated ornament, texts, &c.

The new St. John's Mission Church, which has been erected at Tat Bank in connection with the parish of Oldbury, was dedicated by the Bishop of Worcester on the 9th inst. The church will accommodate 250 persons, and the total cost, including furniture, is £1,400. The architect is Mr. H. E. Lavender, and the builder Mr. A. Kendrick, both of Walsall.

By the fire which broke out on Tuesday in the officers' quarters in Dover Castle, one block was destroyed and the flames spread to another block, which was also seriously damaged. Fortunately, the ancient church of St. Mary was uninjured. As usual, the supply of water was insufficient, and the old-time and inadequate expedient of passing buckets from hand to hand had to be resorted to. An official military inquiry was opened on Wednesday into the cause of the fire at the officers' quarters in the Castle. The evidence of Mr. A. Gregory, district surveyor, and Mr. F. Kidd, foreman of works, and others proved that there was a fracture in a chimney, through which, it is presumed, the rafters became ignited; but further investigation is to be made. Large tanks of water were stored at the top of the Castle Keep; but the pipe conveying the water to the burning building was too small to supply all the engines available for work.

The monthly report for November of the Labour Department states that on the whole the state of employment has been well maintained during the month. In the 113 trade unions making returns, with an aggregate membership of 465,630, 22,281 (or 4.79 per cent.) were reported as unemployed at the end of November, compared with 4.70 per cent. at the end of October, and with 3.0 per cent. in the 111 unions, with a membership of 441,259, from which returns were received for November, 1896. The building trades maintain their briskness, and the percentage of unemployed members has decreased from 1.7 at the end of October to 1.6 at the end of November, the figure at the corresponding period of last year being 0.9 per cent. The furnishing trades, though still showing a slight falling off, are yet well employed, the percentage of members out of work being 2.4, compared with 2.2 at the end of October. The figure for November, 1896, was 2.0 per cent.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—The monthly meeting of this society was held at the School of Art, Arundel-street, on Tuesday. The president, Mr. R. W. Fowler, F.S.I., occupied the chair, and Mr. F. R. Farrow, F.R.I.B.A., of London, delivered an elaborate and most useful lecture on "The Warming of Public Buildings."

CHIPS.

The City Commissioners of Sewers agreed on Tuesday to acquire the freehold interest to the ground needed to widen the public way in front of No. 4, Cheapside for £21,230, agreeably to an award by Mr. A. R. Stennings, and to purchase the freehold interest in No. 126, Fenchurch-street, for £14,250.

The first prize of the International Exhibition of Painting, now open at Pittsburg, U.S.A., has been adjudged to Mr. J. J. Shannon, A.R.A. This prize consists of a gold medal with a purse of 1,500 dol. added thereto. The picture which obtained this honour is a portrait of the artist's daughter "Kitty" in her riding habit.

At Tuesday's meeting of the London County Council, Earl Rosebery, on behalf of the subscribers, presented Sir John Hutton, the former chairman of that body, with his portrait, painted by Mr. Leonard Watts. The portrait will be added to the collection at Spring Gardens, which it is ultimately proposed to be transferred to the municipal hall hereafter to be built. In making the presentation, Lord Rosebery referred especially to Sir John Hutton's hard work on the Building Act Committee.

A new drill hall has been erected at Lincoln, and special consideration has been given to the ventilation, which is carried out on the Boyle system.

Bournemouth town council have considered in committee different proposals to construct electric tramways through the town, and by a majority of two to one they have rejected all the schemes, not deeming it advisable to introduce tramways into the borough.

The Waterford District Asylum, Waterford, is being warmed and ventilated by means of Shorland's patent Manchester grates and Shorland's patent concealed extract ventilators, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

While a number of workmen were engaged, on Wednesday, erecting a temporary bridge over Canal-street, Nottingham, in connection with an extension of the Great Northern Railway, the structure gave way, and some of the men were precipitated to the ground. Albert Harrison was killed on the spot, and two other men were seriously injured.

Dr. Collingridge, the medical officer of health for the Port of London, has been appointed by the Senate of the University of Cambridge one of the examiners for the diploma in public health.

The Dean and Chapter of Canterbury have approved the revised design prepared by Mr. T. G. Jackson, R.A., for the tomb of the late Archbishop Benson. It will be Early English in character, and has a general resemblance to the tomb of Archbishop Peckham in the Martyrs' Chapel. The construction of the memorial will be at once proceeded with, and when completed it will be erected over the resting-place of the late Primate in the north-west angle of the nave.

A Jubilee stained glass window has been placed in the south aisle of Stanton parish church. It is of three lights, and contains full-length figures of Faith, Hope, and Charity, the style adopted being Perpendicular. Messrs. Wailes and Strang, of Newcastle-on-Tyne, were the artists.

The Calvinistic Methodist chapel which is being erected at Llangefni, Anglesey, in memory of the late Rev. John Elias, is approaching completion. It will have cost £5,500.

New banking premises have been built for Grant and Maddison Union Banking Company in High-street, Southampton. The design of the front is founded on the English Renaissance of the early part of the 17th century, and is executed in Portland stone, the whole work having been carried out by Messrs. Jenkins and Son, of Southampton and Bournemouth, under the direction of Messrs. Marshall and Vicken, architects, of Bedford-square, London.

Mr. Alfred H. Frazer, assistant curator of the Walker Art Gallery, Liverpool, died on Friday at his residence at Tranmere. Mr. Frazer had been in the employ of the Library, Museum, and Arts Committee of Liverpool Corporation since 1873. When 17 years of age he was transferred from the Museum to the Walker Art Gallery, eventually becoming the curator's chief assistant.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and SIXPENCE for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

CHRISTMAS DAY.

In Christmas week this Journal will be published on THURSDAY, December 23, in time for Christmas Day. All Advertisements must, therefore, reach the Office by THREE p.m. on WEDNESDAY, Dec. 22, to secure insertion.

RECEIVED.—T. P. and R.—D. O. A.—J. B. H. M.—A. P.—A. W. G.—E. G. and Son.—F. K. and Co.

"BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.—"Nowhere," "The Ant," "Byd," "Stanley," "Cobden," "Crow," "Vim," "Ravenna," "Derige," "Dauchs," "Suburb," "Spero," "Don," "Microbe," "Pick-Me-Up," "Bantam," "Hubert," "Rose-Comb," "Eldon," "Gib," "Gossip," "Stone," "Strax," "Bow Bells," "A Man in the Moon," "Ivy," "Sir Galahad," "Turret," "Oak," "Checkmate," "Spectator," "Wun-hi," "Petticoats," "Bull's-eye," "Chess," "and Co.," "Solo," "Bernard," "R. W. P.," "E. G.," "Kirby Hall" (very late).

HOTSPUR AND KIRBY HALL. (Light can be obtained from the rear for the public library, but not from the right hand side.)

Correspondence.

A PARALLEL TO WALTHAMSTOW.

To the Editor of the BUILDING NEWS.

SIR,—It is the duty of every honest man to aid in letting daylight into the dark and dirty corners of architectural practice. Mr. Dunford, whom a local clique is now trying to deprive of his fairly-earned appointment as architect of the Walthamstow Baths, in order to appoint Messrs. Spalding and Cross, is personally unknown to me; but I have had an experience of my own in which Messrs. Spalding and Cross were prominent figures.

On March 2, 1893, I received from a building committee an invitation to compete with four other architects for some large Sunday-schools (to be used also as a lecture hall) at East Finchley. On the committee's assurance that they intended to put the work into the hands of the successful

competitor, I prepared a design, in conjunction with my partner, Mr. Collinson. In our report the probable cost was estimated as being "near to" (not within) the sum of £3,500, which the committee had named.

On April 26 we received a letter from the secretary stating that the committee had awarded the first premium to our design, and asking us to meet them on April 28th. We met the committee on that date, and received instructions for further important works not mentioned or implied in the competition "instructions," costing, at least, £200. We were at the same time directed to prepare the working drawings and specification.

We again met the committee by appointment on June 6. We laid the working drawings before them and had them approved. We were asked to make some further additions to the scheme involving further cost. We were instructed to get the approval of the local board, to advertise for the names of builders willing to tender, and to have everything ready for getting in tenders at short notice. All this we did, and on June 26th we informed the secretary that in spite of all the additions to the cost which the committee had directed, there was every reason to believe that the work would be carried out for £1,000.

We heard no more for five months. What was going on we did not know, and do not know. But on November 7th a deputation from the committee called on us, and stated that "owing to matters connected with the subscriptions, which there was no need to explain more particularly," it was necessary to reduce the cost of the building by £600 or £700. We made various suggestions for this reduction, and illustrated them by plans and sketches in conformity with the committee's views.

We were summoned to another committee meeting on January 25, 1894. Something mysterious had evidently happened. Ten or twelve gentlemen sat round the room in dead silence, while one, to whom the part had been allotted, informed us of their decision. This was, that they refused to pay anything for all we had done by their orders since the competition. Unless we agreed to this arrangement, their spokesman threatened that our appointment would be cancelled, and that "they would have a new competition." The only excuse offered to us for this remarkable threat was, that our estimate for the scheme with the committee's additions exceeded by a few hundred pounds our estimate without them. That the accuracy of our estimate might be proved, we strongly urged the committee to get in tenders at once. But to this proposal they would not listen for a moment, because, their spokesman said, it would lead to a fortnight's delay.

Our relations with the committee had always been friendly. We thought their new decision a mistake; but it did not strike us then as simply a device for turning us out to let another firm of architects in. We were prepared, therefore, as a matter of good feeling, to waive some part of our right, and to make every allowance for the difficulty in regard to subscriptions. It soon appeared, however, that this was not what was wanted. The moment we offered to discuss the matter we received a letter abruptly dismissing us.

Some time after this we heard that the building was begun, and that Messrs. Spalding and Cross were carrying out our plans. I am glad to have this opportunity of stating that the elevations they adapted to them were not ours. The schools were opened in due time, with much praise to Messrs. Spalding and Cross for the excellence of the arrangement. The *Builder*, of March 15, 1895, says, "the block was erected from the designs of Messrs. Spalding and Cross, at a cost of £3,500." The committee, too, had their own share of laudation, and an eminent speaker gravely exhorted them to "build their characters as they had built their schools!"

The way in which Messrs. Spalding and Cross came to be appointed (it is needless to say, without any effort of their own), is singular and interesting. A firm of builders happened to hear that the committee wanted a low tender. A sudden inspiration came upon them. They felt, and they let the committee know it—that this low tender they were quite prepared to submit, but only on one remarkable condition. The condition was, that the work should be superintended by Messrs. Spalding and Cross. Thus tempted, the committee gave way, and we were dismissed. This, at any rate, is the story which has

since been told us by persons connected with the scheme, and we give it as their explanation—not our own—of the strange, eventful history. But whether it was by this particular expedient, or by some other, that Messrs. Spalding and Cross were assisted in supplanting us, the fact that they did so after we had gained the competition and prepared the working drawings to the committee's satisfaction is undeniable. And, as if this were not enough, they then set themselves forth, or allowed themselves to be set forth, as the authors of a plan and arrangement which they well knew to be ours. If they deny this, I challenge them to produce a ground plan and gallery plan of the block as built, side by side with our plans, which had previously been issued in a circular by the committee.

If these are fair ways of gaining practice and increasing reputation, the sooner we all adopt them the better. If they are not, is it not time that they were treated as the shameful things they are?—I am, &c.,
JAMES CUBITT.

2, Broad-street Buildings, E.C.

SIR,—We notice that Mr. Dunford admits the truth of one of our assertions—viz., that we were consulted by the council, and prepared sketch plans for the building long before his name was introduced in connection with the proposed work. This being so, it is unnecessary for us to comment upon his, unfortunately, inaccurate account of our introduction to the Walthamstow Urban District Council.

Some time after our sketch plans had been submitted to this authority we were invited to compete for the work in question against two other architects experienced in public baths works whose names were mentioned to us (it is perhaps needless to add that Mr. Dunford's name was not included), and we were, therefore, surprised to find subsequently that Mr. Dunford had submitted a design. We have already explained (*vide* our letter which appeared in your issue of the 7th inst.) what took place after Mr. Plumb's report was sent in, and we may here incidentally inform Mr. Dunford, that we have never mentioned Mr. Plumb's name in connection with a "cocked hat" or with any other form of head-gear, nor have we ever competed against Mr. Plumb.

We may inform Mr. Dunford that we have the very best authority for saying that Mr. Plumb considered our design superior to his own.

We have now published the whole of the facts so far as they are known to us, relative to this competition in general and to Mr. Dunford in particular, and we cannot continue the correspondence.—We are, &c.,

SPALDING AND CROSS.

RE FIREPROOF CONSTRUCTED BUILDINGS.

SIR,—We have read with much interest the suggestive letter of Mr. H. C. Standage in your last issue. No doubt Mr. Standage is right in considering it an impossibility to "construct any building that shall be absolutely proof against destruction by fire." To say, however, that no building has ever been constructed which is capable of withstanding something approaching furnace-heat for an unlimited time is, after all, a mere truism, and the point to which practical men will not fail to direct their attention is the construction of buildings in such a way as to withstand intense heat and hold a fire in check for a few hours, and thus afford reasonable time for its extinction. Mr. Standage is amply borne out by experience in his denunciation of the strange combination of "concrete and iron," which, oddly enough, is still regarded as "fire-proof construction" by many worthy men, notwithstanding the fatal and appalling events of the past. It has been proved over and over again that concrete, like other hard, solid substances, acts as a conductor and conveys the heat to the iron, which consequently expands and bursts the casing of concrete, thus causing results which are unfortunately too familiar to need description; of course, if water is pumped on to the superheated "concrete and iron," the inevitable collapse of the building is accelerated.

A few years ago we caused some practical tests to be made for us by Mr. W. H. Stanger, C.E., F.C.S., of which the following is an abbreviated report:—

"The furnace erected for the trial was in full blast, at 2,000° of temperature, at 11.22 a.m. There were placed over it three similar sets of two rolled iron joists. One was packed with 'Silicate Cotton' cased externally with

about an inch of cement composed of plaster of Paris and 'Silicate Cotton.'

"Another set of joists was imbedded in 'Concrete' formed of one to five Portland cement and sand.

"The third set was covered by 'Doulton-Peto Tiles,' with the crevices and interspaces—except the air spaces—filled in with, and the floor surface formed of, concrete, composed of half Portland cement and sand.

"Each set was loaded with 30cwt. of pig-iron, distributed over a length of 8ft.

"The joists covered with 'Concrete' were the first to give way, and they dropped down at 1.7 p.m.

"The joists covered with 'Doulton-Peto Tiles' held out well until 3.40, when they finally succumbed.

"The joists covered with 'Fire-Proof Plaster' and 'Silicate Cotton' were practically unscathed after eleven hours' endurance—for the deflection then did not apparently reach to a quarter of an inch—and there being no prospect of their giving way at 6.45 p.m., the fire was withdrawn. This is the most perfect endurance yet recorded."

The foregoing report speaks for itself, and cannot fail to carry conviction to the mind of every practical reader.

The complete fireproofing of rooms can be effected by lining ceilings and walls with our patent combination slabs—i.e., wired plaster slabs, $\frac{3}{4}$ in. thick, padded on the inner side with silicate cotton. These slabs, when nailed up to the ceiling joists or to sides of walls, and floated over, make a neat finish, and are perfectly sound-proof as well as fireproof.—We are, &c.,

FREDK. JONES AND CO.

Silicate Cotton Works, Kentish Town,
London, N.W., Dec. 13.

CHIPS.

Mr. Thomas Bush Hardy, the well-known artist, died suddenly on Sunday at his residence in Portsdown-road, Maida-vale, aged 56 years. Mr. Hardy, who was the father of Mr. Dudley Hardy, was a native of Sheffield, and was practically self-taught. He travelled a great deal in Holland and Italy. With Mr. Wyllie, he was one of the foremost marine painters of his day, and was a regular contributor to the exhibitions of the Royal Academy.

In order to commemorate the Queen's Jubilee, it was decided to re-hang the bells and erect a new clock in the tower of the parish church of Audley, Cheshire. The dedication service took place on Wednesday. The bells have been quarter-turned and rebung by Messrs. Barwell, of Birmingham. The clock, which has two 5ft. dials, has been supplied by Messrs. Smith and Sons, of Derby.

Important works are proposed at Cardiff by the Windsor Dock Company, whose plans comprise the building of a sea-wall for reclaiming a portion of the Penarth flats in the construction of a dock situated in the bed or on the banks of the River Ely. The dock will be 192 yards wide at its south-eastern end, and 483 yards wide at the opposite end. One of its side-walls will be 566 yards long and the other 640 yards. A lock entrance will be provided. Two jetties, one 117 yards and the other 150 yards long, will be run out from the sea-wall before mentioned.

At the monthly meeting of the Bootle Council on Friday, Alderman Johnson, chairman of the Free Library and Museum Committee, secured the sanction of the members to a plan for the erection of a new technical school, and the institution of a district free library in connection with the borough.

The new organ which has just been placed in Coppenhall Church, near Crewe, was dedicated on Thursday evening in last week. The organ has been built by Messrs. Forster and Andrews, of Hull, at a cost of £542.

The London Water Commission sat again on Monday, Lord Llandaff presiding, when further evidence in favour of a policy of purchase was given by Mr. H. L. Cripps, Parliamentary agent of the London County Council.

In the Queen's Bench Division on Saturday, before Mr. Justice Channell, the hearing was resumed in the case of *Rishton v. The Mayor, &c.*, of Haslingden. It raised the question as to whether a narrow street or passage connecting two main streets in the borough of Haslingden, and known as Back Pleasant-street, was a public highway or a private street, for the sewerage of which, in connection with an improved sewage scheme, the owners of the property in Pleasant-street, fronting the passage, were responsible. Judgment was reserved.

Last week, while digging operations were going on in a garden at Maiden Cross, Hexham, a carved stone was found. This has been examined by Mr. C. C. Hodges, F.S.A., of Hexham, architect, and he thinks it is as early as the 14th or perhaps the 13th century, and that it is the base-stone of the western sanctuary cross which stood on or near the site of the house at Maiden Cross. The base of the eastern sanctuary cross has long been preserved in the yard at the union workhouse, and that of the northern cross is still on the top of the Cross Bank.

Intercommunication.

QUESTIONS.

[11861].—**Roof Stresses: Graphics.**—How is the force diagram for the following constructed, with a view to ascertaining the stresses in the members of a truss? The loads are vertical, distributed thus:—12cwt. on the joint at abutment (left side), 6cwt. at the second joint, 3cwt. at the third, and 15cwt. at the vertex. On the other side of the truss there are no loads. The reactions are inclined at 45° to the vertical. Now, the reactions are obviously unequal, and my difficulty is to construct the force diagram (which, I presume, is a triangle), so as to ascertain the value of the reactions. The line of loads will be vertical. How can a triangle, having the other two sides at 45° with vertical, be completed, unless those sides are equal? This, of course, would be the case if the loads and reactions were symmetrical. Again, let the resultant be substituted for the four vertical loads. This would act about midway between the second and third joints. Then three forces (viz., resultant and two reactions at 45°) in equilibrium should meet at a point. This axiom I also fail to apply.—J. H. M.

[11862].—**Strength of Cast Iron.**—A is a cast-iron column with a base-plate 18in. by 18in. resting on a cast-iron beam-box; the load on A is 100 tons. What ought

to be strengths of the metal for beam-box B? As there would be clearance above the beam, ought the upper plate D to be regarded as in compression or tension; C is a main beam, with supports 18ft. apart.—BATH STONE.

[11863].—**Waterworks.**—Will some reader kindly inform me of a good book on Waterworks, showing plans of reservoirs, filtering-tanks, and general information requisite for the water supply of a town, say, of 10,000 inhabitants?—STUDENT.

[11864].—**Textbooks.**—Kindly inform me through your columns of the best textbook, or books, I could use in preparation for the Honours Exam. in Brickwork under the City and Guilds of London Institute, the sum of which must not exceed 10s. 6d., the value allowed out of the Scholarship I hold? I have Mitchell's "Advanced Building Construction," Wilson's ditto, and Walker's "Practical Brickwork."—KILN.

[11865].—**Sea-Walls.**—Can any practical reader recommend a good construction for a sea-wall of earth or concrete, also a profile that has been found to give economical results? The wall will be at least 5ft. high on the exposed side. If of concrete, what is a good proportion to use?—CAUTION.

[11866].—**Proportions.**—I believe that the section of many of our cathedral churches has been based on geometrical proportions. Milan Cathedral is, according to some writers (Vitruvius, I think, refers to it), designed on a geometrical system, or the vesica. Will any student enlighten me on the subject?—INTERESTED.

[11867].—**Safe Load on Solid Column.**—The weight on a cast-iron column will be about 1½ ton per square inch. What ought to be the diameter for a safe load?—T. H.

[11868].—**Disconnecting House Drains.**—A house drain passes under a house. How can it be ventilated so that it will pass Local Government Board by-laws?—HOUSE-OWNER.

[11869].—**Metal Casements.**—Which are the most weatherproof, wood or metal casements? As the latter do not shrink, I thought they would be the best form of casement for the side of a house exposed to southerly wind and rain. Can sashes be also made of iron or steel? A reply will be thankfully received by—NOVICE.

[11870].—**Heating Warehouse.**—I shall be pleased to be informed how a three-storied warehouse can be warmed efficiently. So many systems are in the market, that it is rather puzzling to know which is considered a good plan of heating. Any particulars of similar warming will be useful. I thought of hot-water heating by means of radiators. Is it costly, and what sizes should the pipes be?—A. S. B.

[11871].—**Treatment of Sewage.**—I shall be obliged if some of your readers will inform me, or give particulars, of the iron or electric process for treating sewage from Zymotic Hospital wards.—N.

[11872].—**Limekilns.**—The owner of a small quarry is asked by his tenant to erect for him additional limekilns, and it has been suggested that by some new process by which the kiln shaft is contracted at its extremities, and widened out to its greatest diameter half-way down, a great saving of fuel is effected by reason of the heated mass of stone and coal being retained in the shaft longer, a smaller quantity of coal will suffice. Is there any recognised system that is preferred in the trade, and where are there any plans to be seen, showing how the construction should be done, the cost, &c.? The Hoffman kiln could

not be adopted, there not being any quantity of stone, and only 12ft. of altitude.—G.

REPLIES.

[11859].—**Retaining Wall.**—The thickness of a concrete wall to bear a bank of earth depends on several factors, height of wall, the nature of the earth or backing, its natural angle of repose, &c. The weight of wall has to be found for a foot in length, also the weight of a prism of earth between wall and natural slope of the material; if these two forces are found, and the point of application of pressure of the earth, the thickness can be determined by drawing a parallelogram of forces. The resultant will determine the thickness of wall at the base by allowing it to fall within the thickness of its foot. Empiric rules are given, according to which the thickness may be put at a third the height of wall. If the wall is 12ft. high, this would give 4ft. at the base; but if the wall is built of good cement concrete, and has a small batter on the face, I should say 3ft. would be ample for ordinary earth backing.—EXPERIENCE.

[11859].—**Retaining Wall.**—"Concrete" does not say what the concrete walls are to support, whether earth or gravel or loose material of any kind, or whether it is surcharged. The usual way of finding proper thickness of a retaining wall is to find load or pressure of the earth and its point of action on the wall, and then, by a simple application of the resolution of forces, the thickness may be found graphically. For a wall to sustain earth with level top and a batter of 2in. per foot of face may be taken at one-fourth the height of wall. According to one rule, a wall of cut stone of large ranged rubble in mortar to sustain a backing of sand, gravel, or earth should not be less than 35 per cent. of height for the top footing course of a vertical wall. Another authority says 24 per cent. of height is necessary for a batter of one-fifth, 25 per cent. for one-sixth, and 32 per cent. for a vertical wall built of brick. These rules may be approximately used for concrete walls. Theoretically, it is considered the pressure against wall is that of a wedge acting between back of wall and an inclined plane determined by experiment for the nature of the soil, and it is assumed that this wedge acts at two-thirds of the height of wall. The moment of overturning force and resistance are equated for a condition of equilibrium, and the usual formulæ to obtain thickness is—

$$t = h \tan. \frac{1}{2} ACD \sqrt{\frac{w}{3W}}$$

ACD represents the prism, w the weight per unit of the earth, and h the height of walls. Tables are compiled on this rule for thicknesses in terms of height and angle of repose.—G. H. C.

[11860].—**Builders' Book-keeping.**—I shall be pleased to supply "Bookie," or any other reader of the BUILDING NEWS, with full-size worked sheets of a good and simple system, both jobbing and contract.—F. J. WEBBER, 19, Leinster-road, Dublin.

CHIPS.

The Passmore Edwards Settlement in Tavistock-place, St. Pancras, which will be ready for occupation by residents after Christmas, will be opened on Saturday, February 12, by Mr. John Morley, M.P. The chair will be taken by Viscount Peel.

The tenth annual dinner in connection with the North-Western and Midland Sanitary Inspectors' Association was held on Saturday evening at the Compton Hotel, Liverpool, when there was a large attendance. The president (Dr. Francis Vacher, medical officer of health, Cheshire County Council) occupied the chair.

The sum of £530,000, voted on Saturday by the Caisse of the Public Debt of Egypt will be devoted to the construction of two subsidiary weirs below the existing barrage—one on the Rosetta branch of the Nile, and the other on the Damietta branch. The object is to diminish the difference in the summer of the water levels below and above the barrage, thus reducing the severe strain yearly thrown on the structure during low Nile. The new dams, by rendering regulation possible during the rising of the flood, will assist in securing the early sowing of a maize crop, while also preserving the rice in Northern Egypt. The weirs are to be commenced next year, and completed in four years.

On Saturday afternoon the Unionist Club in High-street, Galashiels, was occupied for the first time. The front elevation is three stories high, on the ground floor being two shops, with the main entrance to the club between, leading at the rear to the billiard-room, 34ft. by 80ft., and 22ft. in height. On this floor also are lavatories and cloakroom. On the second floor is a reading-room, 27ft. by 16ft., a card-room and secretary's office. On the top story the principal room is 30ft. by 13ft., and is intended for committee meetings. The kitchen and caretaker's rooms occupy the remainder of this floor. The cost of site and building will be £3,000.

A movement, at the head of which is Lord Henniker, has been initiated in Manxland for extensively planting the island with trees, and thus making its arboreal charms more attractive to visitors. On Saturday a meeting was held at Douglas, presided over by Sir John Goldie-Taubman, Speaker of the House of Keys, at which reports favourable to the project were received from various parts of the island. A resolution was adopted for the formation of a tree-planting society, and an influential committee appointed to draw up a constitution and code of rules for the management and development of the same.

WATER SUPPLY AND SANITARY MATTERS.

WATER POLLUTION AND ITS CORRECTION.—At a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on December 6th, Mr. G. Maxwell Lawford, president, in the chair, a paper was read by Mr. Reginald E. Middleton, M.Inst.C.E., entitled:—"The Pollution of Water and its Correction." The author first referred to the recent disastrous epidemics of typhoid fever in Maidstone and King's Lynn, which have forced upon the attention of the public the necessity for protecting our water supplies from pollution. From time immemorial running water has been used for two separate and antagonistic purposes, namely, those of water supply and removal of refuse, and the earlier sanitary legislation is directed towards the removal of refuse by sewerage or otherwise, rather than to the provision of pure water, and that up to the present date the latter is permissive, the former compulsory. It is necessary therefore to enunciate the truism that water is provided in the first place for dietetic and cleansing purposes, and that the removal of refuse by its means must be subordinated to this first and most important requirement. The first element of aggregated health is a pure and sufficient water supply, and we may congratulate ourselves that London is provided with this desideratum, and that the death rate of our Metropolis is only 18·6 per 1,000 against 18·9 for the 33 principal English towns. Notwithstanding that the importance of pure water is now so well understood, it is by no means easy to secure it; the Rivers Pollution Act, 1876, which up to the year 1893 was its only protection, except in a few isolated cases, is so elastic that it is practically impossible to enforce its provisions within any reasonable time unless the authorities themselves are anxious to comply with its meaning. It must be presumed that there is no such thing as pure water in nature, even rain water collects impurities, harmful or otherwise, from the atmosphere, and has ceased to be pure before it touches the ground, by which it is further contaminated. Water which has percolated through clean soil and has reached its underground reservoir has parted with nearly all but its mineral impurities. Deep well water, though frequently hard, is generally free from the presence of many micro-organisms. This very condition, however, lays it open in a remarkable degree to the attacks of pathogenic germs, if any should find access to it. The same thing may be said of moorland waters drawn from rocky districts. The great polluting element is man, whether considered as an individual, or an aggregation of individuals, or as a manufacturer; animal pollutions hold quite a secondary place. The most serious forms of pollution generally arise from the sewage works of towns or villages, many of which are so situated that the acquisition of land suitable for the satisfactory disposal of sewage, and the production of a relatively pure effluent is difficult; the sewage farms or disposal works are seldom of sufficient extent to deal with more than the dry weather flow, therefore in wet seasons the sewage is only very partially purified, for dry soil is the essence of the purifying process. Moreover, it is generally accepted that most of the cleansing takes place in the first few inches, decreasing with the depth, and ceasing, or nearly so, when the line of saturation is reached. Many shallow wells, and some deep ones, become contaminated from neglect of this knowledge, the ground around them becoming sodden with clear water as well as with slops and manure; or they are polluted by leaking drains or cesspools, which, being below the surface, are only slightly affected by the soil. No chemical treatment of sewage is, by itself, sufficient to produce an effluent of satisfactory purity. The author believes that the solution of the problem is to be found in some form of artificial filtration accompanied and aided by biological action. This system also offers immense advantages in dealing with the sewage of large towns in a cheap and effectual manner, and obviates the necessity for the erection of large sewage farms, as well as of large outfall works. It must, however, be worked as carefully as are the filters of a large water supply, and this is not possible in small villages. For the prevention of pollution, and as protection against it, there may be said to be three lines of defence. First, by the introduction of clauses into an act for the prevention of pollution, something on the lines of clauses 93 and 94 of the Thames Conservancy Act of 1894. Secondly, by sedimentation and oxidation in storage reservoirs, by which means, after some 12 days' storage, from 83 per cent. to 96 per cent. of the micro-organisms are removed; and thirdly, by filtration through sand, which retains an average of 99·6 per cent. of the remaining bacteria. Because, however, two good lines of defence are provided, it is no reason why rivers should be polluted.

The memorial stones of a new infirmary block and a new nurses' home, to cost £17,500, were laid on Friday at the Tranmere Workhouse of the Birkenhead Union.

LEGAL INTELLIGENCE.

THE THIRLMERE ARBITRATION.—The protracted arbitration proceedings between the Manchester Corporation and Messrs. Harrison and Wilson, contractors for seventeen miles of the Thirlmere Waterworks between Chorley and Preston, have now come to an end. On Friday, Mr. Harrison Hayter, the referee, sat to a late hour to conclude the hearing of the case, and it will now rest with him to give his award. There was such an enormous mass of detail gone into on both sides, however, that it will take at least a month, it is expected, to complete the consideration of the whole of the evidence. The claim of the contractors amounts to between £50,000 and £60,000.

APPORTIONMENT APPEALS UNDER PRIVATE STREET WORKS ACT, 1892.—The Bournemouth magistrates heard, on Thursday in last week, appeals brought by owners of property in Westbourne Park-road in respect of works proposed to be carried out by the Bournemouth Corporation in that road. Mr. J. Druitt, jun., town clerk, appeared on behalf of the corporation, and Mr. H. T. Trevanion represented the objectors, whose grounds of objection were that the proposed works were unreasonable and the estimated expenses excessive. Mr. Druitt said the street in respect of which these objections were taken was laid out for building purposes by a syndicate on the Westbourne Park Estate, and in this particular road there were 43 separate frontages. These 43 frontages were divided amongst 31 owners, 17 of whom had given notice of objection. Mr. F. W. Lacey, borough surveyor and engineer, said he prepared the specifications and plans for this road, and was of opinion that the prices set down as the estimated cost of the various works were reasonable. In cross-examination, it was elicited that it was intended to lay tar-paving on both sides of the road, although there were many public roads on the West Cliff which had tar-paving on one side only. These, witness explained, were wider roads. Witness was also cross-examined with respect to the catchpits and channelling contained in the specification. The total cost, he said, would be 6s. per foot. Mr. Druitt said that the cost of making-up the Marlborough-road from Clarendon-road to China-road was just under 2s. 6d. per foot; the Grosvenor-road cost between 2s. 9d. and 3s. Appellants called William Humphrey Saunders, retired road and sewer contractor, and also Joseph Francis Jeans, C. H. Mate, and Dr. G. B. Beale, all owners of property on the Westbourne Park-road. William Ely Jones, who has had experience as a roadmaker, was also called. Dr. P. W. G. Nunn, Medical Officer of Health, was called by Mr. Druitt. The Bench said they would allow tar paving on one side of the road only—the western side, which was the most occupied. With regard to the catchpits, they did not think it necessary to interfere with the existing ones. They allowed the amount set down for channelling. Mr. Druitt said the specification would be amended in accordance with their worship's ruling.

IN RE BENJAMIN OWEN, J.P., WREXHAM.—At the Wrexham Bankruptcy Court, on Tuesday, before Mr. Registrar Preston, Benjamin Owen, described as a builder and contractor, of Penybryn, and Bersham-road, Wrexham, came up for his public examination. His statement of accounts showed the gross liabilities to be £12,470 11s., expected to rank £1,312 4s. 10d., assets £1,093 5s. 1d., leaving a deficiency of £218 19s. 9d. The debtor stated that he was a justice of the peace for the borough of Wrexham, and had been for twelve years a member of the Wrexham Town Council. About 30 years ago he commenced business at Penybryn, Wrexham, as a builder and contractor, without any capital; but for many years he carried on a profitable and increasing business. He attributed his failure to losses on quarrying contracts mainly. One of his unfortunate speculations was the purchase of Moelwyn Slate Quarry, at Blaenau Festiniog, which he bought from a slate merchant, John Solomon Jones. He (the debtor) spent many hundreds of pounds in the development of the quarry, and relaying two miles of railway. The examination was adjourned to enable the debtor to prepare a cash account for three years.

RE C. J. WESTWOOD.—A first meeting of creditors was held on Wednesday. The debtor is a civil engineer, having offices at 11 and 12, Clement's-lane. He had a contract for the construction of a new railway in the Isle of Wight, and asserts that he is not insolvent, his present position being due to his inability to place shares which have been given to him in respect of the contract. The liabilities were estimated at about £14,000. It was stated that negotiations were pending with a view to an arrangement, and the creditors passed a resolution adjourning the meeting to Jan. 12.

CLAIM AGAINST THE LONDON SCHOOL BOARD.—Mr. Under-Sheriff Burchell and a special jury at Red Lion-square, Holborn, heard, on Wednesday, the case of "Davies v. The School Board for London." This was a claim for £430 as compensation for the leasehold interest in No. 21, Grange-street,

Hoxton, held for 80 years from Christmas, 1856, at a ground-rent of £5 10s. a year. The experts engaged in the case were Mr. E. F. B. Fuller and Mr. George Stockings for the claimant, and Mr. James Green (Messrs. Wetherall and Green) and Mr. G. A. Wilkinson for the Board. The formal offer of the Board was £364. The jury awarded £400.

CHIPS.

Mr. William Danforth, sen., who died at Red Wing, Minn., November 24, was for many years county surveyor and later city engineer. He was engineer of the Duluth, Red Wing, and South-Western Railroad.

It is intended to carry out alterations at St. Giles's Church, Sidbury. These include the repair and re-roofing of the chancel, the provision of heating apparatus, and a new east window. The estimated cost is £1,000.

A meeting of the Edinburgh Architectural Association was held on Wednesday evening at the Royal Institution, Edinburgh, the President, Mr. Thomas Ross, in the chair, when a lecture on "The Evolution of Style in Architecture" was delivered by Mr. Leslie Ower, President of the Dundee Institute of Architecture.

Extensive alterations have just been completed at the Crown Hotel, in the High-street, Southampton, including the provision of new cellars, kitchen, coffee-room, and billiard-room. Messrs. Mitchell, Son, and Gutteridge were the architects, and the contract has been executed by Mr. Sidney Nichols, also of Southampton.

Mr. Cotton, Local Government Board inspector, held an inquiry at Dublin on Wednesday week in connection with the loan of £20,000 requested by the corporation for the purpose of renewing and relaying the cables used in the electric-lighting of the city.

Recently an ancient urn was picked up from a sandy knoll on the farm of West Skichen, Carmyllie, near Arbroath. It was lying near a dyke, and was just protruding from the ground. The urn is of earthenware, hardly larger than a breakfast cup, neatly formed, and quite entire. It was forwarded to Dr. Joseph Anderson, of the National Museum of Antiquities, Edinburgh, who states that it is a sepulchral urn, and the smallest of its shape that he has yet seen. It belongs to the Bronze Age, and is therefore at least a century or two older than the Christian Era—say 2,000 years, or thereby.

At the Manchester City Art Gallery, on Monday, a bust of the late Sir Charles Hallé was presented to the Art Gallery Committee of the City Council by Sir W. H. Houldsworth, Bart., M.P., on behalf of the subscribers. The bust, which is in white marble, is the work of Mr. Onslow Ford, R.A.

The members of the Baptist community of Santa Rosa possess a church which is remarkable by reason of the fact that it has been constructed entirely from the wood furnished by a single tree. This is a specimen of the redwood tree, similar to that which has furnished Mr. Astor at Clevedon House, Bucks, with a section round which more than forty guests can be comfortably seated. The church is built entirely of wood, the interior being panelled and finished with it. Not only were the floors, the sittings, the pulpit, roof, and roofing furnished by the timber obtained from this tree, but there was left over a large quantity for scantlings and joists, as well as for 60,000 shingles.

The Bishop of Newcastle dedicated a new font in St. Thomas's Church, Barras Bridge, Newcastle, on Monday. The font, which was designed by Mr. Hicks, of Newcastle, is of white Caen stone, octagonal in form, and is richly traceried and carved all over. The bowl, of one large block, has its sides slightly concave, and their tracteries support shields with symbols and monograms, including the Alpha and Omega, the Fish, the Shell, the Lily, the Sign of the Cross, and the initial of St. Thomas. The font is raised upon a traceried stone platform with a kneeling step round it. The work has been carried out by Mr. Robert Beall, of Newcastle-on-Tyne.

A memorial tablet to the late Mr. George Richmond, R.A., which has been placed in the crypt of St. Paul's Cathedral by his sons and daughters at the invitation of the Dean and Chapter, was unveiled on Wednesday afternoon by the Dean, who spoke appreciatively of the venerable painter, alluding to the active part which he played as a member of the first committee for the decoration of St. Paul's. The bronze medallion, with a life-like portrait in low relief within a wreath supported by two amorini with inverted torches, designed by Sir William Richmond, R.A., is mounted in a tablet of rosso antico marble adapted by Mr. John Richmond from an ancient altar figured in Mr. C. H. Tatham's work on classical ornament. Mr. Tatham was Mr. George Richmond's father-in-law. An inscription in Latin, written by Mr. Justice Kennedy, is inscribed upon the marble.

Our Office Table.

SEVERAL fresh pictures have just been acquired for the National Gallery. A portrait of Miss Elizabeth Close, by Geo. Romney, which has been purchased, was hung on Wednesday in Room XVIII. By the bequest of Miss Martha Waterhaugh, of Ayrshire—a portrait, said to be of Queen Catherine Parr, by an unknown painter, probably of the English school. This will be placed in the Gallery shortly. By the gift of Mr. C. Knowles, through Mr. A. Legros—the full-sized cartoon of the Prophet Isaiah, done for the mosaic in St. Paul's Cathedral, by Alfred Stevens; and by the gift of Mr. E. Homan—two water-colour drawings, "A Capri Boy" and "The Seaweed Boat," by the late Hamilton Macallum. The two water-colours are placed in the Water-Colour Room in the National Gallery of British Art, Millbank (Mr. Tate's gallery). The cartoon of Isaiah will be placed ultimately in the same room; it is at present in process of being restrained. Mr. A. Legros has also presented for the National Gallery of British Art a plaster cast of Lord Leighton's original study for the bronze group of the Athlete with the Python, now in that gallery.

MR. W. MURRAY GUTHRIE writes to the daily Press from Stratford House, W.:—"I understand that the Corporation of London, as ground landlords of Stratford-place, have recently sanctioned the adding of a story to the house No. 6, on the east side. I should like to call the attention of the public to what I cannot but consider a most deplorable step. Stratford-place and Adelphi-terrace are, I believe, the sole remaining works of the Brothers Adam of any importance, where their architecture can be seen to-day pretty much as they left it. Stratford-place especially is a self-contained street which shows the Adam style on a large scale, and to make such an addition as is proposed would be quite to spoil the symmetry which was such an important feature of that style and of this particular specimen. The proposed alteration is all the more to be regretted in view of the projected new street, which is to run from Oxford-street to Berkeley-square. This street, with Stratford-place as its culmination, will form a most beautiful 'perspective,' which would be greatly marred by the alteration of Adam's sky line. The Corporation have full powers to refuse the permission demanded, and I hope that, upon their attention being called to the matter, they will reconsider their decision."

The directors of the company for building an hotel on the headland at Newquay have for some months stopped building operations owing to a dispute as to the right to inclose the land, which culminated in August last in the pulling down of the office-shed on the site and in a personal assault on the chairman of the company, Mr. Silvanus Trevel, J.P., F.R.I.B.A., for which offences 26 persons were duly convicted and fined. The directors have now reported to the shareholders that they have satisfied themselves, first, that the lessor's title is indefensible against any supposed or alleged rights or easements which could interfere with the company's operations; and, secondly, that in the event of any further action being taken, either by a public authority or by private individuals, to contest the freeholder's rights, the owner, Mr. Treffry, is determined to defend his title, and thereby protect his tenants, the company. They have, therefore, unanimously resolved to recommence building operations and push them forward. So far the urban district council of Newquay, who were supported by the Commons' Preservation Society, have taken no steps in order to protect the alleged public rights, and it remains to be seen whether they will now proceed to contest the right to build over the headland.

PROFESSOR BENJAMIN IDE WHEELER writes to the *New York Tribune* an interesting account of the explorations which have been made by the Germans at Priene, on the coast of Asia Minor, opposite the island of Samos. Many years ago, the temple of Athena, portions of which were then still standing, was studied by an English expedition, and the capitals and bases there found, under the name of "Fragments from the Temple of Minerva Polias at Priene," are familiar to architects as the most beautiful known examples of these features of the Ionic order. Since the English expedition, the local lime-burners and masons have destroyed what was

left of the temple, and nothing now marks its site but a heap of stones. Two years ago the German archaeologists resolved to begin new investigations, and the excavations so far made have been surprisingly fruitful. Although Priene did not reach the height of its prosperity until the time of Alexander, it seems to have possessed a certain superiority of artistic cultivation, possibly in consequence of the relations which it maintained with Athens, of which it is said to have been a colony; and the substructure of the ancient city has been found in a remarkably perfect state of preservation, so that the streets, with the various buildings on them, the agora, with its porticos, the council-house, the seats in which are still in place, and a small theatre, are plainly to be distinguished. In the private houses, not only is the style and general distribution quite distinguishable, but the remains of the decoration are still visible. Professor Wheeler likens the ruins to those of Pompeii, and the study of them, in comparison with those of the Græco-Roman town of nearly five hundred years later date, will be most instructive.

SLAG-WOOL is undoubtedly a material that, for fireproofing, sound-deadening, and insulation of heat and cold, has no rival. Many whose attention has been aroused by the correspondence in our own pages and elsewhere, induced by the recent disastrous fire in the City, would do well to get a little treatise just issued by Messrs. F. M'Neill and Co., of Bunhill-row, E.C., on the uses of the slag-wool they make, and which has many superior qualities to recommend it. Many readers will be surprised to find how many little difficulties of construction in the case of brewery cellars, ice-houses, tanneries, hospitals, school-houses, theatres, flats, iron buildings, &c., are obviated by an intelligent application of slag-wool.

EVERY architect and builder who wants a good desk-remembrancer, blotter, or pocket calendar for 1898 should get one of the useful and artistic-looking ones issued by the Sun Insurance Office. As they reach us year by year we always involuntarily recall Scott's lines—

"The vernal Sun new life bestows
E'en on the meanest flower that blows"

—and heartily trust the "Sun" is likely to do so for another hundred and eighty-eight years, believing, as we honestly do, that it is the very best office a man can make provision for his family in, or safeguard his property in against disastrous fires, and with our belief fortified by gratifying personal experience of the prompt business-like methods which govern both departments.

Complete plans for the Zoological Gardens in Bronx Park, New York, have been prepared by Messrs. Heins and La Farge, architects, of that city, and have been laid before the Park Commissioners and approved. The arrangement will be such that if the Zoological Gardens should ever be abandoned for any reason, the removal of the animal houses will convert the whole into a well laid out pleasure park. The animal houses are to be designed to fit the landscape features of the park.

The rural district council of Helmsby have instructed Messrs. Fairbank and Sons, of York, to proceed with the preparation of detailed plans for affording a water supply to the villages of Stonegrave and Nunnington.

An electric-lighting scheme for Weston-super-Mare, formulated by Mr. W. C. C. Hawtayne, and recently adopted by the town council, has been reconsidered and modified so as to reduce the estimated cost to £20,000.

The fifth annual dinner of the Bristol Clerks of Works and Builders' Foremen Association was held at the Grand Hotel, Broad-street, on Saturday. There was a very large attendance. The chair was taken by Mr. H. Dare Byron. Mr. W. Woodrow gave "The Architects," and Mr. Frank W. Wills acknowledged the toast in a humorous speech. Mr. James Hart also responded. Mr. T. Godfrey gave "The Builders," and Mr. Krauss (president of the Master Builders' Association), and Mr. F. N. Cowlin responded. The chairman proposed "The Association of Clerks of Works and Builders' Foremen," and Mr. W. Kidwell (secretary) replied.

The corporation of New York has decided to acquire immediately property for the construction of eleven docks on the North River. They will each measure 800ft. long by 200ft. wide.

Mr. W. R. Symonds, of Ipswich, has received a commission to execute a portrait of Mr. Joseph D. Everett, D.C.L., F.R.S., of Natural Philosophy at Queen's College, Belfast. The portrait is to be placed in the hall of the college.

LIST OF COMPETITIONS OPEN.

Bootle—Fire Brigade and Police Stations (£14,000 and £1,500 limits)	50 Guineas, 25 Guineas	J. H. Farmer, Town Clerk, Bootle, Lancs	Dec. 31
Altrincham—U.D.C. Offices	£20, £10	J. Stokes, Clerk, 64, Market-street, Altrincham	" 31
Crich—Water-Supply Scheme (3,100 population)	15 Guineas, 5 Guineas	Joseph Pym, Clerk, Belper	Jan. 8
Carlton, Victoria—Children's Hospital	£100, £50, £25	J. Nicholson, Hon. Sec., Pelham-street, Carlton, Australia	" 30
Leicester—Motor Refuse Carts	Corporation	E. G. Mawbey, Borough Engineer, Leicester	" 31
Port Elizabeth—Free Library (Assessors, Sir F. Blaine and R. H. Hamersley-Hunan—£22,000 limit)	100 Guineas, 50 Guineas	G. Oettle, Librarian, Port Elizabeth, S.A.	Feb. 15
New York—Sun Dial (Plaster Model)	500dol., 250dol.	Sec. National Sculpture Soc., 215, West 57th-street, New York	" 28
Newcastle-on-Tyne—New Infirmary (local Architects)	(No first) £150, £100, £50	Secretary Building Committee, Newcastle	Mar. 1
Belper—Sewage Disposal Schemes	50 Guineas, 25 Guineas	Joseph Pym, Clerk, Belper	May 1
Lymington—New Forest Hall (limited to Hampshire Architects)	25 Guineas	Clerk to Hall Committee, Lymington	"
Berwick—Police Station (£3,000 to £4,000 limit)	£50, £25	The Town Clerk, Berwick-on-Tweed	"

LIST OF TENDERS OPEN.

BUILDINGS—continued.

Wetherby—Tall Brick Chimney	Wharfedale Brewery Co.	T. A. Battery, Architect, Queen-street, Morley	—
Middleton-St. George—Private Asylum		John W. Dyson, Architect, 67, Grey-street, Newcastle	—
Winchester—Six Cottages		J. A. Sawyer, Surveyor, 62, High-street, Winchester	—
Morecambe—Four Dwelling-Houses, Balmoral-road		Harry Eastwood, 19, Regent-road, Morecambe	—
Great Horkeley—Addition to The Cedars	W. Page	Chas. E. Butcher, Architect, 3, Queen-street, Colchester	—
Skegness—Primitive Methodist Chapel (450 sittings) and School		Hy. Harper, Architect, Market-place, Nottingham	—
Islington, N.—Block of Flats		Walter Stair, 9, Queen Victoria-street, E.C.	—
Stratford, E.—Additions to Premises, Martin-street	S. Gulliver and Co.	W. Taylor and Sons, Architects, Aylesbury	—
Fairfield—Pair of Semi-detached Houses and Two Shops		J. H. Burton, Architect, 2, Guide-lane, Hookey Hill	—
Worthing—Post Office		R. Singer Hyde, M.S.A., Worthing	—
Colchester—Business Premises, Long Wyre-street	Shaws, Bryant, and Co.	Chas. E. Butcher, Architect, 3, Queen-street, Colchester	—
Edmonton, N.—Fifty Cottages		Architect, care of Fuller and Jackson, 11, Grocer's Hall-court, E.C.	—
Stretford—Laundry, Chester-road		Johnstone Brothers, Architects, 39, Lowther-street, Carlisle	—
Lianduno—Completion of Duke of Clarence Memorial Church	Rev. Francis G. Jones, Vicar	J. Oldrid Scott, Architect, 35, Spring-gardens, London, S.W.	—
Skegness—Two Boarding Houses		C. Nelson Holloway, Architect, Angel-row, Nottingham	—
Skegness—Primitive Methodist Chapel		H. Harper, Architect, Market-place, Nottingham	—
Bury—Five Dwelling Houses at Littlewood Cross	Bury Brewery Company	Thos. Nuttall, C.E., Architect, &c., 20, Market-street, Bury, Lancs.	—
Nottingham—Workshop and Offices, Pepper-street		C. Nelson Holloway, Architect, Angel-row, Nottingham	—
Oakworth—Warehouse, Providence Mills		Judson and Moore, Architects, York Chambers, Keighley	—
Pontefract—Reconstruction of Inn	Brice, Butler, and Lee	Tennant and Bagley, Architects, Pontefract	—
Padstow—Hotel		Crickmay and Sons, Architects, 13, Victoria-street, Westminster	—
Londonderry—Dwelling House	Jonathan Hamer	R. H. McElwee and Co., Architects, 9, Carlisle-road, Londonderry	—
Bury—Twelve Houses off Bolton-road, Elton		D. Hardman, Architect, Silver-street, Bury, Lancs.	—
Newquay—Headland Hotel		Silvanus Trevail, F.R.I.B.A., Architect, Truro	—

ENGINEERING.

Glasgow—Four Cast-Iron Water Tanks, Five Lancashire Steam Boilers, and Cooking Apparatus at Ruchill Hospital	Corporation	John Lindsay, Interim Clerk, City Chambers, Glasgow	Dec. 18
Kirkcaldy—Heating of Memorial Halls		Dunn and Findlay, Architects, 35, Frederick-street, Edinburgh	18
Fletton—Pipe-laying	Norman Cross Rural District Council	Wm. Pettit, Clerk, Union Offices, Peterborough	18
Totnes—Pipe-laying at Diptford	Totnes Rural District Council	Thos. W. Windeatt, Clerk, Totnes	18
Cadiz—Canal (about £55,000)		Direction General of Public Works, Madrid	18
Eastbourne—Widening Promenade	Highways Committee	R. M. Gloyne, Borough Engineer, Town Hall, Eastbourne	20
Canterbury—Electric-Lighting Plant	Corporation	H. Fielding, Town Clerk, 15, Burgate-street, Canterbury	20
Bo'ness—Reservoir, Brunton Burn	Police Commissioners	R. J. Jamieson, Town Clerk, Bo'ness	20
Renwick—Oblique Bridge across the Raven	Penrith Rural District Council	C. N. Arnison, Clerk, Penrith	20
Dundee—Service Fuse Boxes	Gas Commissioners	Sir T. Thornton, Clerk of Commissioners, Town House, Dundee	20
Luxemburg—Railway Construction Works		Administration of Prinz Heinrich Eisenbahn, Luxemburg	20
Atherstone—Extension of Water Mains	Rural District Council	W. A. Hatton, Clerk, Atherstone	20
Swinton—Sinking Well near Thomas-street	Urban District Council	R. Fowler, Engineer, Swinton	21
Hammersmith—Two Vertical Engines and Two Flywheel Alternators	Vestry	W. P. Cockburn, Vestry Clerk, Town Hall, Hammersmith	22
Salford—Stone-Breaker		Samuel Brown, Town Clerk, Town Hall, Salford	22
Workington—Heating the Central Stores	Industrial and Provident Society	W. G. Scott and Co., Architects, Victoria Buildings, Workington	23
St. Anne's-on-Sea—Refuse Destructor	Urban District Council	Thomas Bradley, Clerk, Park-road, St. Anne's-on-the-Sea	24
Carrikerfergus—Rebuilding Retort Bench	Gas Company	David Gillespie, Secretary, Carrikerfergus	27
Braila—Bridge and Road (about £7,507)		The Prefect, Braila, Roumania	27
London—Arc Lighting Extension	Vestry of St. Pancras	C. H. F. Barrett, Vestry Clerk, Pancras-road, London, N.W.	28
Cults, N.B.—Waterworks and Sewerage Works	Aberdeen District Committee	Alexander Clark, District Clerk, 13, Bridge-street, Aberdeen	28
Port-Glasgow—Waterworks at Parkhill	Commissioners	Leslie and Reid, C.E.'s, 72A, George-street, Edinburgh	28
Wick—Harbour Improvement	Wick & Pulteney Harbours Trustees	D. W. Georgeson, Harbour Secretary, Wick	28
London, E.C.—Bridge Work	Bengal-Nagpur Railway Co., Ltd.	The Company's Office, 182, Gresham House, E.C.	29
Criccieth—Sea-Wall at Maes Aberieidd	Criccieth Urban District Council	Thomas Jones, Clerk, Town Hall, Criccieth	30
Catauzaro—Electric Tramway from Town to Station		The Municipal Authority, Catauzaro, Italy	30
St. Gilles-lez-Bruxelles—Gasworks	Council	The Secretary, 504, Chaussée de Mons, Anderlecht, Brussels	31
Canterbury—Refuse Destructors	Corporation	Henry Fielding, Town Clerk, Canterbury	31
Bedworth—Waterworks	Foleshill Rural District Council	Alfred P. Oswin, Clerk, Union Buildings, Foleshill	31
Belem—Two Steam Pumps, Three Boilers, Iron Reservoir, &c.		Junta do Tesor de l'Etat de Para, Brazil	31
Brazil—Railway from Novo Hamburgo to Caxias	Government	Central Directorate, Public Works, Porte Alegre	31
Denbigh—Laying 13,200 yards of Cast-Iron Water-Mains	Visitors of N. Wales Counties Asylum	Wm. Barker, Clerk to the Visiting Committee, Denbigh	31
Helmley—Waterworks	Helmley & Kirbymoorside R.D.C.'s	Robert Pearson, Clerk to Helmley R.D.C., Helmley, Yorks	31
Epchester—Siding at Hamsterley Colliery		Owners of Amsterley Colliery, Epchester, R.S.O., Co. Durham	31
Waterhouses—Brick Bridge over Holburn Beck	Brandon and Byshottles U.D.C.'s	John George Wilson, Clerk, 5, North Bailey, Durham	31
Glantana-ta-isa—Bridge	Denbighshire County Council	L. Adams, Clerk, Ruthin	Jan. 1
Lisbon—Canals in the City	Urban District Council	Department of Public Works, Lisbon, Portugal	1
Little Hampton—Storm-water Works	Guardians	Arthur Shelley, Clerk, Town Offices, Littlehampton	5
Dunmanway—Supply of Water	Guardians of Ballyshannon Union	J. Lane, C.E., Bandon	7
Bundoran—Waterworks		James Perry, M.I.C.E., County Surveyor, Galway	8
Athens—Docks Extensions (about £110,000)	Electric Light Committee	Chancello, Monarchie Attique, Athens	9
Bedford—Electric-Lighting Plant	Corporation	T. S. Porter, Town Clerk, Town Hall, Bedford	10
Bootle—Electric-Lighting Plant	Electricity Supply Committee	J. H. Farmer, Town Clerk, Bootle	10
Gloucester—Plant on Low-Tension System at Electricity Works		Geo. Sheffield Blakeway, Town Clerk, Guildhall, Gloucester	18
Kirkcaldy—Reservoirs at Holl, Arnot, and Carberry; and Filters at Holl	Waterworks Commissioners	William D. Sang, C.E., Kirkcaldy	19
Pernambuco—Port Works	Government	Brazilian Ministry of Public Works, Rio de Janeiro	Feb. 28
Madras—Utilisation of Water of Periyar Lake		Chief Engineer for Irrigation, Madras	July 1
Tralee—Three-ton Steam Crane	Harbour Commissioners, Tralee		—
Altham—Septic Tank	Burnley Rural District Council	S. Edmondson, Surveyor, 18, Nicholas-street, Burnley	—
Ymiden, Holland—Metal Sluice Gates (estimated cost, £19,600)	Government of Montenegro	Provincial Authorities, Harlem	—
Val de Noche, Dulcigno—Quay and Breakwater (about £76,500)		Minister of Foreign Affairs, Cetigne	—
Whitehaven—Driving Tunnel, 12ft. by 8ft. 6in.		William Pitt, Whitehaven	—
Llanwenarth Citra—Laying Water-Pipes		Alfred Edwards, The Steps, Llanwenarth Citra	—
Hull—Low-pressure Water Meters	Waterworks Committee	F. J. Bancroft, Water Engineer, Town Hall, Hull	—

FENCING AND WALLS.

Walmer—Fencing & Levelling Recreation Ground, Campbell-st.	Urban District Council	F. W. Hardman, Clerk, Walmer	Jan. 5
Hunslet—Wall in Pepper-road		W. Broughton, Builder, Jesmond-terrace, Pudsey	—
Lazonby—Wall near Post-Office		E. James, Silloth	—

FURNITURE AND FITTINGS.

Stockwell—Furniture, Bedsteads, and Bedding to South-Western Ambulance Station	Metropolitan Asylums Board	T. Duncombe Mann, Clerk, Norfolk-street, Strand, W.C.	Dec. 18
Croydon—Furniture for Cottage Homes, Mayday-road		Harry List, Clerk, Union Offices, Mayday-road, Thornton Heath	24
Liverpool—Extension of Nurses' Home at Workhouse	Select Vestry	H. J. Haggart, Vestry Clerk, Parish Offices, Brownlow Hill, Liverpool	—

PAINTING.

Carlisle—All Schools	School Board	T. Taylor Scott, F.R.I.B.A., Carlisle	Dec. 25
Nottingham—Eight Board Schools	School Board	W. J. Abel, Clerk, Victoria-street, Nottingham	—

PLUMBING AND GLAZING.

Llanerchymedd—Cold Water Supply to Workhouse	Anglesey Board of Guardians	Thomas Hughes, Clerk, Menai Bridge	Dec. 29
--	-----------------------------	------------------------------------	---------

ROADS AND STREETS.

London, E.C.—Paving with Jarrah Wood Chiswell-street	St. Luke Vestry	G. W. Preston, Clerk, Vestry Hall, City-road, E.C.	Dec. 18
Cardiff—Paving and Channelling Eldon-street	Corporation	W. Harpur, M.I.C.E., Borough Engineer, Town Hall, Cardiff	20
Barnet—Kerbing, Channelling, and Tar-Paving Roads	East Barnet Valley U.D.C.	Henry York, Surveyor, Station-road, New Barnet	21
Catford, S.E.—Forming Brownhill-road	Lewisham Board of Works	The Surveyor's Offices, Lewisham Town Hall, Catford, S.E.	21
Tunston—Paving and Drainage Works	Urban District Council	T. J. Rowland, Clerk, Council Offices, Urmoston	21
Hullfax—Completion of Road (44ft. wide)		W. G. Gray and Son, Architects, 28, George-street, Halifax	21
Reading—Paving and Kerbing Thames-avenue	Sanitary Authority	John Bowen, A.M.I.C.E., Borough Engineer, Town Hall, Reading	21
Birkenhead—Making-up Various Streets	Corporation	A. Gill, Town Clerk, Birkenhead	22
Blackpool—Street Works	Corporation	J. Wolstenholme, Borough Engineer, Blackpool	22
Morley—Paving and Flagging Hull-street		M. H. Sykes, Borough Surveyor, Town Hall, Morley	23
Morley—Paving and Flagging Gainsborough-street		M. H. Sykes, Borough Surveyor, Town Hall, Morley	23

St. Anne's-on-Sea—Making-up St. Anne's-road West, Nelson-street, and St. Alban's-road	Urban District Council	Thomas Bradley, Clerk, Park-road, St. Anne's-on-the-Sea	24
Tunbridge Wells—Sewering and Paving Roads, St. James's Park Estate	Corporation	W. C. Cripps, Town Clerk, Tunbridge Wells	29
East Molesey—Making-up Seymour-road and Beauchamp-road	Urban District Council	John Stevenson, Surveyor, Walton-road, East Molesey	31

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2242.

FRIDAY, DECEMBER 24, 1897.

DRIFTING INTO PRACTICE.

A STRANGE variety of circumstances have marked the course and destiny of many men who have become eminent in the profession. After changing about from one thing to another they have settled down, often without any aim, to the vocation of architect as a means of earning a living. Not a few of them have drifted from plodding business pursuits connected with building into art; many have passed from surveying into an architectural practice, while a few have exchanged the carpenter's or mason's tools for the drawing board and pencil. We hear of many who have taken the retrograde course, and have actually left the artistic for the business and mercantile part of the profession. In the case of very many they have not been able to pick and choose a line for themselves; in fact, in a majority of instances some hindrance has prevented them from following the path they had sketched out.

There is the young enthusiast for art who leaves school and enters an office. He soon finds it all drudgery. Business routine is everything. The principal has been brought up in a builder's or surveyor's office, and he discourages all attempts on the part of his pupil to become too fond of art. He sets him on making tracings, specifications, and builders' measurements, and will on no account give his youthful charge any opportunity of reading books like Fergusson's, of copying examples from Street or those from Nesfield, Shaw, or Gotch. That the atmosphere of such an office is anything but congenial to the youthful mind which is looking above mere business qualifications cannot be doubted for a moment, and yet it would not be difficult to prove that a very large proportion of our leading architects who have made a name in the profession have commenced their careers in offices of this description. Barry, Blore, Scott, amongst Gothic revivalists, commenced their lives, or spent a large part of their early pupilage, under conditions that were not favourable to art, and it would be easy to give a long list of those who have made a name as adapters of the Classic, who were article to men whose acquaintance with the art were limited to a knowledge of the Five Orders or the mode of measuring. This pent-up and restricted discipline of the office with its routine and drudgery has not been without its advantages. It has served to restrain and discipline the youthful mind in the fundamentals of the profession till it could be intrusted to soar on wings of its own. Even a modern revivalist of one of our latest art schools has said that an architect could not do better than "cut his teeth" on the Classic orders. The fact is that the artist, like the musician, is all the better qualified for his work by having practised "on the scales" of his art.

If we take the contrary procedure of stimulating the imagination at the onset, of letting it soar unguided through realms of fancy, the result is generally an early disappointment, and, is it not borne out by actual experience that the student who allows himself too unbridled an imagination is the man whose ardour is easily daunted? And this is why, we believe, much of the academical training of the architectural student is found to be a mistake. His ambition is stirred to do something extraordinary—to design cathedrals and costly fanes, Houses of Legislation, municipal palaces, noblemen's houses, large art gal-

leries, and the like—instead of the more modest buildings of everyday life, and such as he will be called upon to design and carry out. In the effort to accomplish a task which calls for their highest powers, there is the danger of exaggerating the imaginative or ideal qualities, and a reaction follows. Having scaled the grander and more ambitious heights, the student looks with disdain on his everyday work, which is performed in a perfunctory manner. The result is disastrous. The young draughtsman who has been making ideal perspectives and elaborate façades loses heart, and settles down to a commonplace level when he comes to do ordinary building designs. But it seems otherwise with one who begins his profession on the lowest "rung" of the ladder, and who ascends by degrees to a higher class of work, supposing, of course, that he has artistic capabilities which can be developed. His imaginative powers seem to grow as they are called into requisition. Suggestions of material and requirements of building furnish food for the imagination, which is developed more that it has some basis to stimulate it. Is it not true that a practical want has suggested to the architect a feature of value, and some material a new treatment? On the other hand, a grand façade designed without reference to any consideration of fitness or utility, or a copy of some notable building, is like an empty high-sounding phrase expressing no adequate meaning or plan. And it is on this theory that we find the man who has acquired the rudiments of the profession—the man of business habits who has inherited art instincts—the more successful. He is often stronger in plan, more disciplined, and able to understand his client's wants. Competition furnishes many instances of this kind of architect. He may not be a great draughtsman himself; but he knows where to go to, and his taste seldom deserts him. Our Barrys, our Scotts, our municipal hall and school builders—the men who have done the best work in cities, our hotels and commercial buildings—have generally been of this calibre. If not talented, their work is always good. On the other hand, how many we find of those who have won Academy medals and Soane Medallions, who have done brilliant service in their earlier years, falling back in the race simply because of the want of practical qualifications! We do not mean by such questionable business tactics as those we have heard of lately in connection with a competition for baths, where the architect who had been employed to make plans was unceremoniously ousted for others in the same craft. No honest man, however talented, could hold his own against the pushing practitioner, or against business activity like that described by a writer last week in our "Correspondence." But the gifted artist fails for want of being able to marshal his facts; of being unable to cope with practical requirements, and to put them into shape.

The man who confines himself to one kind of work is often one who has drifted into it. He is rarely or seldom nurtured or trained as a specialist; but circumstances over which he has had little control have favoured his position. A successful competition for, say, a town hall or public baths and washhouses, has often been the opportunity. We have our Waterhouses, Colcutts, Mountfords, who have won deserved reputations as designers of municipal buildings. Once the problem has been solved, the inherent difficulties of planning disappear, and every subsequent design of the same kind makes the attainment of the solution more certain. But they would have been equally successful in any other branch, as in the case of those we have named. We are not sure that any architect who has the power of design has a particular predilection of talent for any one class of building in the first instance.

The special knowledge comes afterwards. A competition for a municipal building, public baths, a workhouse, or a church may decide his choice. Having once "broken the ice," the fortunate candidate finds it easier to pursue one branch of his profession. Undercurrents of thought or influence may assist him. We know not a few men who entered the profession as students of ecclesiastical architecture, but, through various influences, friendship, and patronage of another kind, have drifted along a quite different path, as designers of hospitals and other buildings of a secular class. A few have become quite experts. Other men who began in a general practice have become church-builders. A versatility of mind has no doubt been a determining influence. Men like Sir Chas. Barry, Sir Gilbert Scott, Mr. Street, the late Mr. Pearson, R.A., who could do justice to any line of study they took up, have more or less drifted into channels they have made their own. Style has also been one of the determining forces. A man brought up in the office of a Gothickist, surrounded by an atmosphere of Mediæval thought and art, must naturally find his particular sphere in church building and restoration, and we have in the great trio of architects, Scott, Street, and the late Mr. Pearson, eminent instances of education in style determining the career. Mr. Pearson early identified himself with the Gothic movement, and his earlier Yorkshire churches show his knowledge of ecclesiastical architecture as it was understood in this country, though his later efforts prove him to have adopted many French and Continental features, as we find in his great churches of St. Augustine, Kilburn; St. John the Evangelist, Red Lion-square; and, later still, in his great work at Truro, still incomplete, in which foreign influence is felt, even through the beautiful Early English detail. And so Scott and Street both drifted into their own favourite expression of style, even when they turned their hands to purely secular buildings like the St. Pancras Hotel and the Law Courts. Others, in whom the influence of style or early art training is less strong, are ready to practise in any style;—they design houses, churches, schools, workhouses, banks, libraries, and any other sort of building that comes into their way. Taking a medium course between the essentially artistic and the purely commercial, they become thoroughly practical and business-like, and often achieve success.

The education and circumstances, social and otherwise, have much to do with the prospect of an architect. In his interesting book of "Experiences," Mr. Darbyshire shows how, under favourable conditions and good patronage, a provincial architect can succeed, and his own achievements are a proof of it. Of course, a great deal depends on the kind of *clientèle*—whether they are commercial or artistic. And, as the author observes, if the architect is commercially-minded, he gets on well, for he can give as many kicks as he receives. Over-sensitiveness is not his weakness. If, on the other hand, he cherishes strong art convictions, the road to success is beset with thorns. He has to fight with clients who pretend to know more about building and art than himself; he has to humour whims and fancies. The utilitarian client, who believes in square houses with centre doorways, plenty of plate glass, and sacrifices all architecture to iron columns and girders and other utilities of commercial life, is one of the hardest men to deal with; though worse than he is the man who has a smattering of what he calls art, and intrudes his views upon his adviser in the most provoking way. Clients of this sort constitute the most unfavourable conditions for the young architect—who cannot select his patrons. Unfortunately, many of those who have the highest aspirations in their profession

are thrown among them; others who are less appreciative and critical enter calmer waters, where conflicts and eddying currents are less known. There is only one remedy—namely, that of training the architect for that particular kind of patronage he is likely to obtain; but as yet it is impossible.

MECHANICAL RESTRAINTS.

THE direct influence of mechanical science and contrivance on the architect's work is one of the distinctive characteristics which separate modern from ancient practice. It is true the ancient Roman, Byzantine, and Mediæval builders were acquainted with mechanical principles; their masons knew how to construct arches, vaults, and domes, and to poise nicely the vault on slender pillars, and transmit imperceptibly its thrust to the ground by a delicate system of buttressing. The Roman engineer or architect was able to supply Rome and great cities of the Empire with water carried by aqueducts of amazing height and cleverness equal to anything the modern engineer can show; but his mechanical skill was based on a few well understood laws, and made to subserve construction. On the contrary, the modern architect and engineer look upon construction as independent of mechanical laws, which they are obliged to learn if they desire to build safely. These principles were in the time of Vitruvius limited to the mechanical powers, and they were applied without all the circumlocution or mathematical formulæ as used now. We have now all kinds of definitions and distinctions to master in learning such a thing as mechanics—"potential energy" and "kinetic energy," each of which must be distinguished as energy stored up or expended in motion, and this applies to air and fluids and various materials; "mechanical advantage" or the ratio of effort to resistance of a machine. These and many other things the modern constructor has to learn from books, which give no idea at all as to how they can be applied to practical problems. Most of us know what the ancients knew of hydraulics, as the invention of the Archimedean screw for raising water. We may see granite and stone inscribed with hieroglyphics, showing armies of slaves dragging or pulling ropes to lift monoliths. A few hundred years ago Fontaine raised an obelisk at Rome by the aid of 40 capstans worked by nearly a thousand men and horses; but the same feat was accomplished on our Embankment with the help of four little 100-ton hydraulic jacks, each worked by one man. We have in this incident a simple illustration of mechanical power as exercised by the ancient builder and by ourselves. Tremendous weights can be lifted or great pressures exerted by the use of water instead of levers and wheels. Anyone who observes the erection of a large building will find how much is done by mechanical means. Huge blocks of stone and iron beams can now be lifted by means of hydraulic cranes, and moved to any position by a few handles. The construction of our great girder and cantilever bridges of iron and steel is rendered comparatively easy by hydraulic forging, and small riveting-machines can now be used close to the girder from a steam-engine and pumps at a distance. The number of hydraulic machines made upon the principle of the press—such as the lifting or crushing-jack, punching-bear, forging and welding machines, hydraulic lifts—shows the multiplication of mechanical industry in one department. More directly connected with the architect's work are the number of labour-saving machines used in stone and wood-working, which have a direct bearing upon design, all of which were unknown to the old builder. The average architect feels less compunction in designing stone and wood mouldings and patterns for walls,

since he can have these supplied for him ready-made. He is restrained from exercising his own inventive talent by knowing that the stock pattern is less expensive. He selects moulded bricks, ready-made castings in iron or brass, tile patterns and wall designs in various fabrics, because he knows they can be procured at less cost. All these are the results of mechanical invention. But mechanical principles enter into the design of our construction at every step which our forefathers knew nothing about. Formulæ and rules are applied to such matters as arches, vaults, roofs, girders, and columns. Certain canons of proportion, geometrical and numerical, probably taught the Mediæval architect how to proportion his pillars, arches, and other masses of masonry. They were results derived from experience. Now the same things are regulated by graphic statics or mathematical analysis. If we want to construct an arch of masonry that shall be in equilibrium, we proceed according to rule to find the load which it has to bear, and to equate the moments of thrust with that of abutment, or graphically, by means of a force-polygon, by which we can determine the thrust of every arch-stone or the line of resistance within the thickness of arch. So, too, we have mechanical means of finding out what depth and size beams of iron must be to carry certain weights. If we discard these rules, we do so at the risk of failure. The public expect the architect to understand them, to know what is necessary to insure stability. In such matters as hydraulic apparatus, lifts, hot and cold water supply, laboratory and workshop fitting up, bath and laundry arrangements, &c., mechanical considerations and contrivances enter largely into the design of the architect. They require him to study departments of science which lie outside his particular art. They often interfere with his taste, and rob him of that serenity of thought so necessary to artistic conception. At every turn engineering forces itself upon his attention—he cannot ignore it.

There is one indirect way in which architecture is affected by mechanical invention—namely, the contact of the profession with engineers and inventors, plumbers, and other mechanical trades. The architect rarely writes a specification without referring to these trades more or less directly. He has to specify the sizes of columns, the depth and thicknesses of iron girders, iron roofs, hydraulic lifts, plumbers' fixtures, heating and ventilating details. That these exercise a rather restraining and subduing influence on his design cannot be disputed, nor are they always favourable. They bring him into contact with men who have no sympathy for art, who wish to display their own trade, who make the most of technical difficulties, and who endeavour to make profit out of them. Take ironwork. Patterns for castings of columns, capitals, spandrels, brackets, and other details have to be made from designs supplied by the architect. These have to be made to conform to certain mechanical and physical laws; the contraction of the molten iron in cooling has to be considered in the size of the wooden pattern, so that it should be large enough; internal strains caused by inequalities of contraction have to be taken into account, sharp and re-entrant angles have to be avoided, &c. Then such details as riveting, welding, connections, hinged joints, roller bearings, have to be specified. In New York and Chicago, engineering experts find a new field of labour in co-operating with architects in the erection of lofty buildings in which structural iron and steel are employed. The steel-skeleton building has enlisted the services of these specialists, and in this country it is not uncommon to find the architect co-operating with engineers

about many problems of structural ironwork, heating and ventilating, and many other things, so largely do mechanical considerations enter; but the circumstances lead to an important question. Is it easier to import the engineering element into architecture, or the aesthetic element into engineering? On several important grounds, we should be sorry to see the mechanical expert or engineer encroach on the architect's province. He may co-operate in certain cases; but the architect ought never to agree to his dictation or interference in matters of design. Yet we see plenty of this in large buildings. The pattern of an iron column, capital and base, of brackets and spandrel, is left to the engineer, sometimes even more important details, like an iron roof. It is because the average architect knows so little about iron construction that he is compelled to go to the engineer; but is the compliment reciprocated by the engineer? Does he come to the architect for advice or assistance in designing his buildings for railways, bridges, factories, waterworks, viaducts, gas-holders? Very seldom. They are generally left to the draughtsman or assistant of the engineer, and, as a rule, are the most commonplace of structures, haphazard in their arrangements and crude in detail. It ought certainly to be easier for the architect to learn construction than to expect an engineer to feel the influences of art under his present training. Æstheticism is born, not learned, and no amount of instruction can make an engineer an artist if it is not in him. When it is, we find him achieving architecture almost unknowingly. Then the architect is largely influenced by the lesser details of trades. Who has not felt the depressing influence of having to provide for the plumber or the ironmonger, to have to give way to patterns of new grates and gas-fittings? And yet the architect, if he is equal to his task, ought to be able to turn these mechanical contrivances to account, to throw over them the spell of his art; so to arrange and select the most commonplace detail, such as a door-lock or a gas pendant, that it may not mar the character and unity of his design as a whole. No doubt very few can do this. All these things seem to break and disconnect the charmed circle of his inspiration, as if some electric connection had been broken, or as if the electricity of his own nature had been repelled, the flow of his art had been stopped. Hideous and commonplace these contrivances of a commercial age are unquestionably; but even they may be made less awkward and repellent than they are if the architect took them under his care, and tried to do something with them. If the architect threw himself into this part of his task—that of making the most common and mechanical things presentable or appropriate, half the excrescences and monstrosities we see might be avoided. Master the mechanical and turn it to the best advantage, is the maxim to be learned in these days of competitive industries.

And lastly, what should be the meaning of style to us? Are we compelled to conform to this or that style of the past? Certainly not, if we mean by "style" a method or a phase of a particular period—if we mean to have an architecture of our own. We must try to realise all that we have learned of mechanical science in its varied applications to building before we can dare to say we have a style worthy of the traditions of the past. It may be a difficult and arduous task to accommodate ourselves to modern requirements, to modern engineering problems and construction; but it has been done in the past, and can be done again. Ingenuity of plan and construction is a hard problem now, but we have instances of its accomplishment, as in the new McEwan Hall of the Edinburgh University we illustrated last week, with its essentially modern application of scientific

principles, its wood panelled dome of steel, its acoustic arrangement of plan, its lighting by electricity. Though we may not at first produce an architectural result that is harmonious, we may look on such buildings as steps in the evolution of a mode of construction that can be dignified by the name of Architecture.

WHAT IS A FIRE-RESISTING BUILDING?

WE continue to receive all kinds of suggestions and remarks having reference to the great City fire. As in the profession of medicine, all sorts of remedies and specifics are propounded, amongst them a good deal of what may not inaptly be termed quack remedies. There are some who lay more stress on extinction of fire than on fire-resisting construction. Various kinds of appliances for extinguishing fires, such as hand-grenades, automatic sprinklers, steam, &c., have been brought forward. There are others who advocate systems of construction and special fire-resisting materials, the belief being that prevention is better than cure. Both classes of exponents have something of value to say. We shall always have buildings stored with inflammable goods, which goods are liable to become ignited, whether the building is fireproof or combustible, and such fires must be extinguished. On the other hand, it is the duty of the architect or builder to use the most fire-resisting methods and materials he can. It is comparatively an easy matter to extinguish a fire confined to one room or department if taken in time, or in a room that can resist intense heat for a certain time; but it is a more difficult thing to render our buildings fire-resisting, or to be able to make every division of a building so resisting as to confine a fire for at least long enough to burn itself out without extending to other parts. This, indeed, is the problem architects and engineers have to accomplish. We have to consider not only materials, but the methods these ought to be employed, the construction no less than the material. There is a tendency among those who write on the subject to separate these two things—to consider one of them only, to the exclusion of the other. The most perfect fire-resisting lining or plaster may be found, but it is of no use if only partially or ineffectually applied—if, for instance, despite its use, well-holes and lifts and openings exist in the walls which will allow flame to enter another floor or department, also stored with inflammable goods. It is the burning mass of combustible matter, like furniture or clothing, that is the danger. If we can surround this mass with fireproof floor, walls, and ceiling without any openings, it will burn out quickly, if there is no air to feed the fire; but if there are openings—a staircase or lift, or other aperture—the conditions of burning become favourable, and, of course, in every room or floor that cannot be closed effectually, there is the risk we most dread. One of our correspondents (Mr. H. C. Standage) affirms, what is known by experience, that an absolutely fireproof building is impossible. Even "fireproof plaster" cracks or peels off the iron and brick surfaces if great heat is evolved, and all that can be done is to so construct our walls and floors that they shall defy heat and fire as long as possible. A well-known firm (Frederick Jones and Co.) last week confirmed also what is generally known: that "concrete and iron" are not fireproof; that the concrete acts as a conductor of heat to the iron imbedded in it, and the latter expands and bursts the concrete—such, at least, has been the usual experience in great fires. The experiments they refer to also appear to be conclusive as to the fact that rolled iron joists packed with "silicate cotton, cased externally with plaster of Paris and silicate cotton," resist fire better than the

ordinary concrete covering. The experiments quoted in our last issue deserve notice.

As to the behaviour of iron when once it is exposed to the action of fire, no one for a moment claims for it any great fire-resisting qualities; and the examination of the iron-work at the ruins of the late fire proves how iron joists and T and channel-iron are liable to twist and buckle, with serious consequences to the walls of buildings. The solution of the problem—How to construct a building that will withstand intense heat, and hold a fire in check for some time?—can be attained if a suitable casing for the iron is used, and at the same time the conditions for confining the fire are observed. No other means are available. At the last meeting of the Society of Architects the question was fully discussed, and is reported in our pages, and it is to be hoped that some of the suggestions made will receive the attention they deserve. That brick or clay products are the only safe material for walls and arches, that iron girders and columns should be of the box form and protected with metal lathing and cement; that floors should be solidly constructed and protected; that windows facing streets and light areas should have asbestos cloth blinds, are suggestions all will endorse.

THE SOCIETY OF ARCHITECTS.

A "SOCIAL evening for discussion" was arranged by the council of the Society of Architects to be held on Thursday evening in last week, the theme to be considered being "Lessons to be Learned from the Late Fire in Cripplegate." The announcement proved very attractive, for the meeting-hall of the Society at St. James's Hall, Piccadilly, was filled. Little tables were arranged as in a restaurant, here and there about the room, on which cups of coffee and biscuits were provided, and the permission to smoke was generally availed of by members and visitors. In the absence of the President, Mr. Walter Emden, who sent a telegram regretting his unavoidable detention by business at Southampton, Mr. W. R. Mallett, member of council, occupied the chair. M. E. J. Soil, of Tournai, Belgium, secretary of the Historical Society of Tournai, was elected as an honorary member, and Messrs. John Millar R. Smetham and John Whitehead, both of Albert Chambers, Albert-street, Harrogate, were elected as members, in all cases unanimously and by ballot.

LESSONS OF THE LATE LONDON FIRE.

Mr. ELLIS MARSLAND, hon. secretary, opened a discussion on this subject by reading the following short paper, which was illustrated by a number of lantern views taken immediately after the fire by the lecturer. Mr. Marsland expressed his thanks for the kind assistance received from his friend, Mr. Edmund Woodthorpe, the district surveyor for the Northern Division of the City of London, and also to his friend Mr. Howard Colls, and his foreman, for conducting him over the various points from which the views were taken. Having shown and explained a series of sixteen views of the ruins, including a plan of the fire area, showing the extent of the conflagration, Mr. Marsland proceeded: You will have gathered from the views the effect of fire upon tall buildings, situated in a crowded area, abutting upon narrow streets, constructed in the ordinary manner with brick party-walls, stone fronts with a large area of glass, looking into light courts in the rear, the floors of wooden joists supported on iron girders; the roofs of timber covered with slates, the interiors lined with match-boarding, and divided up with wooden partitions, the communication by wooden staircases, and the buildings filled with wooden fittings and inflammable goods; and one is not surprised at the result. From my own observation, and from inquiries, none of the destroyed buildings laid any claim to be fireproof, or even fire-resisting. I am dealing with the subject this evening upon the supposition that the whole area destroyed will be reinstated. It will be needless to discuss this matter on the basis of rearranging the area and constructing wider streets, as, were this done, an Act of Parliament would be necessary, and the question would at once arise: Why deal with this

comparatively small area, when there are others in the immediate vicinity equally as bad, if not worse?—and so the question would widen out till half the City might be included in the area to be dealt with. The lines upon which I should like this discussion to run to-night are these: accepting the confined area, narrow streets, and tall buildings, can we offer any practical suggestions to prevent or minimise the rapid spreading of fire under these conditions? The point to be aimed at is to confine the fire to the premises in which it originated, and if we can do this till the firemen have arrived and can surround the fire, we have attained our object. Vertically, this is now done by brick party-walls, but horizontally the floors, roofs, and open fronts, back and rear, are the points upon which amendment and alteration are required.

PRACTICAL SUGGESTIONS.

The suggestions I have to offer are these:—

1. That all buildings of this class be constructed of brick, without iron or stone lintels, and that openings have brick arches. When I say brick, I, of course, include all clay products. If a brassummer is necessary over the ground story, let it be of some hard wood, with the lower edges rounded. A box girder might be permissible if protected with fire-resisting material, and so fixed as to allow of expansion.

2. That all warehouse floors be of concrete, and any iron girders, joists, or columns carrying the same be protected with metal lathing coated with fire-resisting cement, and the hollow space between run in with fine dry sand, and that the floor boards be laid directly upon the concrete.

3. That all roofs be flat, and of concrete covered with cement or asphalt, with a parapet 2ft. 6in. high all round, and that all staircases and lifts be inclosed with a brick wall, and any openings closed with teak doors. The staircase should be of teak or oak, and carried up to the flat roof; this would be a safe exit in case of fire, and enable the fire brigade, without so much risk to life and limb and loss of valuable time, to cope with an outbreak, and utilise the flat roofs as "quoins of vantage" to localise the fire.

4. That all windows looking into streets or light courts have an asbestos cloth roller blind, or some other non-conducting flexible material, fixed on the outside, running in a groove of iron fixed in the reveals and manipulated from the inside, and which could be readily drawn over the glass window in case of a fire opposite. It would also be a desirable practice that these blinds were drawn at the close of business each day, so that it could be ascertained they were always in working order. This, I suggest, would protect the glass from a great deal of heat, and thus prevent the fire from spreading across streets and light courts in several directions at the same time, as is so often the case now, through the breaking of the glass.

These are the suggestions I have to offer. Fires, like the poor, will be ever present with us while warehouses exist, stored with inflammable materials. But, occurring in moderation, they are perhaps, so far as architects are concerned, not altogether to be deplored, and if we construct our buildings of the fire-resisting materials I have ventured to suggest, fires may be kept within reasonable limits, and a repetition of such a disaster as we are met here to discuss will be obviated.

DISCUSSION.

Mr. G. A. T. MIDDLETON asked if any difference was noted between the behaviour of iron and steel in the fire.

Mr. MARSLAND replied that the buildings were erected a few years since, before steel was generally employed for construction, and, as a matter of fact, all the metal work he inspected was of iron. There was a marked difference between the effect of fire on box girders and rolled joists, as would have been seen by the photographs. Where two or more channel-section irons were riveted together, they were twisted and disturbed, in some cases into a corkscrew form; but where they were built up into a box girder, the shape was preserved.

Mr. J. R. MANNING said they were greatly indebted to Mr. Marsland for his suggestions. He thought wooden beams were preferable to iron girders, and that plaster might be used more freely as a covering material for ironwork than at present. In Paris a much greater use was made of plaster than in London, and he had noticed in inspecting the ruins of fires in the

former capital that flames generally stopped on the plasterwork against steel framing. He thought that they might wisely imbed their rafters, timbers, and joists in plaster; that partition-walls might be constructed very roughly of brickwork and then plastered; and that iron girders might be case in lathing, and then similarly treated. An asbestos blind to windows, if worked from inside, would do much to check the leaping of fires across narrow openings.

Mr. EDWIN O. SACHS said the illustrations were most instructive, as they gave bull's-eye views of the results of a fierce fire in a narrow thoroughfare. As to the lessons, he feared there were not many to be learned from this Cripplegate fire. They had long been aware that channel-iron twisted into corkscrew forms, that party-walls with doors and other openings in them would not check the progress of fire, and that flames would jump across narrow spaces to combustible materials beyond. It was, indeed, an old, old story; but what they wanted to know was how to check the spread of fires in such localities? It was to a considerable extent a question of the amendment of the London Building Act, because if a building owner did not wish to improve his property and render it more nearly fire-resisting, neither the architect nor the district surveyor had any power to make him protect his own property and that of his neighbours; they could not make him increase his ironwork or adopt more modern means of construction. The question was also one of planning. In many of the houses involved in the Cripplegate fire, four or five suites of buildings shared in the same risks, owing to the connection by doors and narrow wells. It could not be expected that the streets could be widened to any great extent owing to the immense value of land in this business locality, so that architects must try to make a practicable job of existing circumstances. As to the proposal to adopt flat cement roofs, these would be very valuable for a fireman to operate on from next door to a fire, but they had the great disadvantage when themselves attacked by the flames that, as the fire was unable to break through, a mass of smoke was accumulated in the building, which made the task of firemen more difficult. The use of asbestos curtains would certainly prevent the spread of fire if drawn over the windows; but if these were let down at night it would give a fire, should it break out, an excellent chance of obtaining a hold that it was impossible to cope with when at length discovered. It would, he feared, be difficult to increase the stringency of the Building Act; when the present measure was before the House of Commons, grave objection was made to the raised parapets over party-walls, on the ground that they were unnecessary and unsightly. The protection of iron columns sought to be threshed out by a series of official tests. One of the weaknesses of such a discussion was there had been no independent tests of fireproofing materials, but that they relied for their facts on the experiments made on their own inventions by interested parties. These were cleverly carried out, but were regarded by the profession with a certain amount of prejudice, and obviously more confidence would be felt in the tests made by unbiased persons.

Mr. ROHNS referred to some fireproofing materials he had invented many years since, and claimed that he had taken out a patent for petrified under the name of manganese as far back as 1873.

A TRIBUTE TO THE FIREMEN.

Mr. WILLIAM COOPER, of Hastings, suggested that single joists of iron or steel should be protected by a flitch of wood placed on either side. Whatever they might think of the evidence given at the present inquest into the Cripplegate fire, members could, he urged, have but one feeling, that of admiration, for the plucky conduct and endurance of the firemen. He concluded by moving a resolution congratulating Commander Wells on the heroic fight of his men with the flames, and asking that that expression of opinion be made known to the officers and men of the brigade that took part in the work.

The resolution was received with applause.

The CHAIRMAN said it had not been intended to propose any motion that evening; but so strongly did he feel in the matter, that he would beg to formally second the resolution from the chair. The motion was carried unanimously.

COMMANDER WELLS, R.N., who was among those present, returned thanks, and said he could assure them that the compliment was well deserved by his officers and men. If there had

been any failures, it was through the way they were led, and he accepted all responsibility for that. The very first remark he had heard coming into the room was that all the firemen were old sailors, and could not be taught anything. He affirmed, however, that they were willing to learn anything they could, and that was why he was present. He pointed out that, whereas architects could take photographs after the fire, the firemen could take observations while it was in progress, and he thought the question of construction might be discussed with greater advantage if the Fire Brigade were consulted. He was about to report to the London County Council as to the circumstances of the fire, and till then must reserve any observations he had to make. As to the width of the streets, he thought the man to be considered was the owner of the premises. The width of the street was given them, and they had to make their houses to suit the owner. He did not know how, except by Act of Parliament, the width of the streets could be improved. In conclusion, he observed that as far as his experience, after spending seven years in the United States, went, firemen in London had to work in very narrow thoroughfares under conditions different from those in any other city in the world.

Mr. M. MARSLAND suggested that large asbestos curtains should be stored by the Metropolitan Fire Brigade, which could be taken to the scene of a fire and let down from the roofs of adjacent buildings in front of walls and windows liable to be attacked. If such sheets had been available at the outbreak of the Cripplegate fire, its limits could have been considerably restricted.

Mr. ALEXANDER J. SMITH suggested that a concrete layer in the centre of party-walls would prove an excellent barrier to the extension of fire. The comparative stability of box and compound over sample joists was very suggestive of the lines on which they should go in construction. The floors of warehouses should be of concrete, crushed brick, or breeze, and the joist should be imbedded in the floor, and the surface and ceiling protected by a thick coat of plaster, and, as prescribed by the new Building Act, care should be taken to allow for expansion of girders at the ends, so that the walls were not forced out. The great difficulty of imbedding wooden strips in the concrete floors, as suggested by Mr. Marsland, was that as they would be put in wet, they would afterwards shrink, and so tend to divide the floor into separate sections, and, further, would be very liable to dry-rot. The best finish for a floor would be a cementic or granitic surface. If flat cement roofs were provided, they should be approached by good concrete staircases with cement treads. If warehouses were thus built, there would be little for the flames to seize upon, and they could be rendered still less inflammable by making the window-frames of wrought-iron, with small panes of glass. The chief risk, then, would be of flames extending to neighbouring properties. He fancied the asbestos blinds, although a good suggestion, would not be drawn down when the alarm of fire was given. The great obstacle to all these suggestions was that of cost. A district surveyor had recently stated publicly that iron and plaster instead of timber construction would mean an outlay of an additional 50 per cent.; but he joined issue with that assertion, basing his views on actual estimates. In an outlay of £3,250, the difference for making floors fireproof was, in one case, £125, after allowing for the lessened weight owing to the thinner floors and ceilings. In the instance of a single floor of 250 yards super., the difference in tender was £25; and in a third case of a four-floor warehouse on the Thames side having a floor area of 667 yards, the variation of lowest tenders were £260 against the fireproofed construction on an outlay of over £10,000. An outside estimate would give 10 per cent. as the additional cost of providing fire-resisting materials. A more pressing point was that of insurance. At present the fire companies would not reduce their premiums on insurance on the ground of better protection from fire, which was obviously inequitable to the building owner who spent capital in making his property more secure. The committee of the fire companies was about to meet, and, in view of the late fire, were expected to raise their rates considerably—it was rumoured as much as 100 per cent.—and he would suggest that Mr. Sachs' committee should urge this point upon them.

Mr. SACHS said his committee now numbered 250 gentlemen, about 100 of whom were archi-

tects. The question of insurance would not be overlooked; but, of course, fire insurance companies regarded the matter from a business point, and if there were no fires their occupation would be gone.

Mr. HAROLD E. IVATTS suggested that the plan now universal in packing iron safes might with advantage be applied to warehouse party-walls. These walls might be built hollow, and filled in with sulphate or silicate of aluminium. The cost of the material would not be great—not more than £2 to £3 per ton.

The CHAIRMAN proposed a vote of thanks to Mr. Ellis Marsden for his suggestive paper, which had provoked an excellent and powerful discussion. This was carried by acclamation, and suitably acknowledged by Mr. MARSLAND.

THE ARCHITECTURAL ASSOCIATION.

THE fifth ordinary meeting of the Association for the present session was held on Friday evening at 9, Conduit-street, W., the President, Mr. Hampden W. Pratt, F.R.I.B.A., in the chair. The following five new members were elected: C. M. C. Armstrong, J. F. Ball, C. H. R. Henman, A. C. Notley, and C. Newborne. The President referred in feeling terms to the death of Mr. J. L. Pearson, R.A., and it was decided to send a vote of condolence to the family. He also announced that an A.A. Lyric Club Cinderella Dance would be held at the King's Hall, Holborn Restaurant, on Friday, Jan. 7, at 7.30 p.m., and that the following classes were about to commence: "General History" (Division II.), to open on Dec. 23; "Stresses and Strains" (Division II.), Jan. 3; "Quantity Surveying," Jan. 7, and "Elementary Construction" (Division I.), Jan. 10.

HOUSE DECORATION.

Mr. L. A. SHUFFREY read the following paper on this subject: I shall endeavour to treat the subject from the practical rather than the theoretic side, confining myself mainly to the skin, or surface, which appears to the eye, and the preparation of the ground to receive it. The trade "painter" hardly gets its share of attention in many specifications, and the description, "clearcoke and distemper ceilings, hand paper at so much per piece, and paint all work usually painted four coats of good oil-colour," will not insure a good result in the hands of the ordinary contracting builder. For many years the tendency has been towards depending upon manufactured wall and ceiling coverings rather than upon hand-painted decoration, panel, and pilaster treatment, and arabesques until the practical painter who can carry out work of this kind has become a rarity. A difficulty in the painting trade is that fluctuations of work at the different seasons of the year have a demoralising effect upon the men. When work is slack many are thrown out of employment, and when busy others are taken on who can just handle a brush, but who have served no proper apprenticeship to the trade. It is absolutely necessary to the successful carrying-out of a job that a skilful and experienced foreman painter should have charge of it, whose duty it should be to control the execution of the work, mix all materials, see that proper tools and plant are used and taken care of, and that the rubbish is cleared away from time to time, and the rooms kept clean. I do not propose to go into the proportions of the mixtures of materials to be used, as I could not give information on this subject from actual experience: it is a part that an architect can hardly be expected to remember, and must leave to the foreman painter. It is, however, a great convenience, and commands respect from the workman, to be able to take palette and palette-knife in hand and mix the tint required on the job. In so doing it is very desirable never to use a colour or vehicle without knowing its name and qualities, as the experience gained thereby will be very serviceable. It is difficult to gauge the amount of time this mixing of tints will take, and it is desirable not to make a following appointment too soon after. In the progress of a new building you have no doubt, when visiting the works, been suddenly confronted with the question from the foreman of the job? "What colour are we to paint the outside woodwork and the down-pipes and gutters?" and in making the design you will very likely have mentally disposed of the questions whether the frames and sashes should be white, the down-pipes green, whether the iron gutter running along the extreme projection of

the heavy overhanging main cornice should be treated as a member of it, at great inconvenience on account of its falls, or to a quite different colour on its own account; whether the outside timber-framing, if any, shall be coated with Stockholm tar, in strong contrast to the white plaster panels treated with a coating of boiled tallow and lime; and whether the barge-boards or verge mouldings shall be light, like the sashes, or dark, like the framing; whether the front door shall be dark, and, if so, shall the solid frame which surrounds it be the same. The raising of these questions should be a hint that the inside colouring will be coming on shortly for determination, and a scheme of colour for the various rooms should be thought out. Painting has two objects in view—either to change the colour of the surfaces of the various articles painted, or to protect them from rust, rain, or wear. When applied it must become hard, and must adhere firmly to the substance painted. It is desirable, if not absolutely essential, that it should retain its colour, as, although many beautiful effects come through change and exposure, they are generally due to the disintegration of the surface, or decay, which can only go on for a limited time. Many of you may have admired the greenish blue colour, originally a common green, of an old garden gate; but if you examine it for the purpose of imitation, you will find that the colour eludes you, being made up of different-coloured particles which you cannot match. The pleasant pinky red of old cart-wheels, which looks so nice in a farmyard, is a cheap vermilion which has faded. Tints should be made stronger in outside painting than at first desired, to allow for some diminution from exposure, which will most certainly occur, and for the reason that colours are softened by the atmosphere. In this respect colours vary very much, losing less as they increase in warmth. A soldier's coat will appear its reddest on a foggy morning.

EXTERIOR.

The earliest opportunity of a fine day should be taken advantage of to paint all the external wood and ironwork, the priming having been done before fixing. The woodwork, if it be a light colour, will require four coats of white-lead, mixed with linseed-oil and driers; if to be finished a dark colour, boiled oil, which is a better drier, should be used. For external ironwork, paint composed of oxide of iron and linseed-oil is the best protection. I am informed that in cases of engineering works which have been sent abroad, ironwork which has been painted with oxide paint has stood much longer than similar work painted with red-lead. A drawback to the use of oxide paint is that the range of colour is limited, being principally red, which, in the case of a red brick house, is the last colour one would desire. Other colours can be obtained by mixing, but the protecting qualities of the paint are reduced thereby. All gutters should be painted inside as well as out. A painted front door to a house, if exposed to a sunny aspect, is a constant source of trouble, as the paint soon cracks and blisters, and has to be burnt off down to the wood each time it is repainted. A practical painter has told me, speaking from actual experience, that if zinc-white is used instead of white-lead this will not happen. In the case of town houses, cemented or stuccoed fronts often have to be treated, and this is generally done with oil paint; it is a heritage left to us by a former generation, and we must make the best of it. The only satisfactory feature about painted cement work is that it keeps the wet out. The money spent on the painting of cement fronts in London would have paid for the use, in many cases, of Portland stone or rubbed brick—the two materials which, in my opinion, are pre-eminently suited to the London atmosphere. When cement is left from the float with a granular surface, it has a pleasant enough appearance; but it gets so grimy in time, painting in oil is resorted to, and this looks very well until successive coats have filled up the grain, which then has an unsatisfactory reflecting surface. Cracks appear which have to be stopped, and a Portland cement cannot be painted with safety until it has stood about two years; these cracks have to be stopped with Roman cement. A distemper which would stand the weather would be the solution of the problem. The conclusion which I come to is, that Portland cement facing is not suitable for London. For reasons of economy, outside painting should be limited in extent as much as possible. Woodwork should be painted every three years with good white-

lead and linseed or boiled oil, special care being taken to see that the surface should be dry and free from dust when it is applied.

INTERIOR.

In dealing with the interior of the house, I propose to take the parts of the rooms in the order in which they are usually finished—ceilings, woodwork, walls, and floors. Ceilings give the decorator more trouble than any other part of the room, for various reasons, the principal being the cracking of the plaster. I have no doubt you are all familiar with the maps of rivers which present themselves when you look at the ceiling on a bright morning a year or two after a house has been built, caused partly by the shrinkage of timbers or vibration from persons walking on the floor above, defective sand, lime, or hair, or by the floating and setting coats following too quickly after the rendering, before it had time to get thoroughly dry. To prevent this, ceilings should be lathed on cross battens or ceiling joists fixed beneath floor joists. If ornamented, the most convenient plan is to form them of fibrous plaster, the method being to make models of the various parts, and then from plaster, wax, or gelatine moulds make their casts of plaster of Paris which have imbedded in their thickness canvas and sawn laths of pine, in places where required for strength or fixing. These slabs are then fixed to the battens with screws, and the joints made good with plaster and canvas. Existing ceilings can be covered up by fibrous plaster screwed to the lath and plaster, provided, of course, that the latter is sound. Brass screws should be used, as iron ones rust and stain the plaster. Ceilings on the underside of floors composed of iron and concrete can be plastered right on to the concrete; if the boarding on to which the concrete is thrown is kept down low enough beneath the joists for the concrete to pass under. Cracking sometimes occurs through the iron joists being run into flues, and the expansion and contraction of the metal caused thereby. In fixing ornamental ceilings of fibrous plaster, battens should be used nailed to the concrete. The most usual method of finishing ceilings is in distemper or tempera. In the case of new work the surface should be clearcoated, i.e., washed over with a coat of thin size and whiting, having previously removed excrescences, if any. The distemper is made by dissolving the best whiting in clean water until it is of the consistency of thick cream, and perfectly smooth to the touch, to which should be added prepared size, previously warmed, the colour being separately rubbed up with some of this distemper; the whole should then be gently mixed together, and strained through a coarse cloth or metal strainer. When allowed to set it should be of the consistency of jelly, in which condition it should be applied to the ceiling. As distemper changes its colour very much in drying, it should be tried on a piece of white paper and allowed to dry. The drying may be assisted by holding it against the face or back of the hand, but not by holding it to the fire, which would prevent its drying its natural colour. Having procured the right tint, the distemper should be applied quickly to the ceiling with large brushes, preferably by two pairs of hands, and then stippled with large, flat brushes, taking care not to go over the same part twice. There should be no draught in the room whilst this is in progress; but when completed the sooner it is dried the better. If this operation is successfully carried out, a very pleasing effect is obtained. If the first coat does not dry out satisfactorily, the operation may be repeated. Even with experienced hands distemping is not always successful, particularly if done during foggy weather. If dealing with old ceilings, the distemper must be washed off right down to the plaster face, all cracks raked out and stopped with putty (plaster of Paris and distemper mixed), and the whole rubbed smooth with pumice-stone and water; stained parts should be painted with oil-colour, and the whole clearcoated and distempered as before described. If old ceilings are in very bad condition, it is desirable that they should be lined with paper, which should have a coat of weak size before being distempered. Distemper is superior to oil-colour in the clearness and delicacy of its tints, and in that it does not discolour in the same way with age. Its demerits are that it will not bear washing, and, being thick, it soon chokes up delicate mouldings or ornament; it is, therefore, the custom, where there is a considerable amount of elaboration or ornament, to execute the work in

oil-colours, either flatted or flat varnished. This in a country house, or where no gas is used, will last a great many years, and bear washing and touching up. If dealing with ornament in relief, it is a good plan to paint the work twice with oil-colour, and then distemper it. The distemper coat rather pleasantly softens the ornament, and can be washed off down to the oil-colour, when the work has to be redecorated. Some of the coarsely-modelled ornament of the Jacobean period may owe its charm to the indistinct suggestiveness caused by successive coats of distemper, but it is hardly desirable to aim at an effect of this kind. The style or ornament which we understand as "Adam's" is often executed of composition fixed with tacks and glue in small repeats on a plain ceiling previously lined with paper. This is a very refined style of ornamentation, and is often pleasantly relieved with painted medallions, in which case a parti-coloured treatment is desirable to hold up the medallions and prevent them spotting too much. The electric light being frequently placed near the ceiling, very slight relief is sufficient, the light coming almost horizontally, and throwing long shadows. Covering a ceiling with a pattern paper is a simple and satisfactory way of treating it. The pattern should be centred with the room, and the joints carefully butted. Stamped materials for ceiling coverings are numerous, and by their use an exceedingly elaborate effect can be obtained at a very moderate cost. The best are they which do not imitate plaster-work. They are very useful for strengthening and hiding the defects of old ceilings in a bad condition, but have not the individuality which can be procured by even a little plaster ornamentation designed for its special position, and I look upon them as suitable rather for old than new buildings. The plan of hanging a heavily-flocked paper on the flat of a ceiling and painting it is a good one, and the effect is much improved if a flat band forming a frame to it next the cornice can be arranged so that the ornamented portion has a recessed appearance. This flat band was much affected during the Greek revival period in England, and often had paterae fixed on it at intervals. In applying to an old ceiling either ribs, or any relief ornament which has strongly pronounced straight lines, it is necessary to apply a straight-edge to the surface to ascertain whether it sags or undulates: otherwise you may find that what appeared level before becomes like the waves of the sea.

WOODWORK.

If it is desired that the woodwork of a house should be painted, and not stained and varnished—a process which has almost died out—any knots should be covered with patent knotting, to prevent the resin discolouring the succeeding coats of paint; or, if very bad, they should be cut out or covered with silver leaf. Before the work leaves the carpenter's shop it should be primed with red or white lead, mixed with linseed-oil and turps, to prevent its being affected by a damp atmosphere. Backs of panelling, or any woodwork which has to be fixed against a wall, should have a thick coat of oil-colour before fixing. Before the next coat is applied, the surface should be lightly rubbed down with glasspaper, and the brad-holes, open joints, or cracks filled with hard stopping, and the dust removed. The second coat, mainly of linseed-oil and white lead, should then be applied. The third coat, which is the ground for the finished colour, composed of white lead and linseed-oil and turps in equal proportions, and with an approach to the finishing colour, should be evenly laid on, the direction of the brush following the direction of the grain of the wood. This should dry out uniformly; and if it does not do so, should be repeated before the finishing coat is applied. By mixing varnish with the finishing coat, an egg-shell gloss is obtained, and this is the finish which appears to me most suitable for work generally. It does not require so much preparation as varnished work, does not show up slight unevennesses, and will bear washing. It is sometimes called a bastard flat. If it is desired that the surface shall not shine at all, it will require a flattening coat of the required colour mixed with white lead and turpentine only. Flattening should follow the previous coat about twenty-four hours after, before it has had time to get hard, so that it may be incorporated with it, and the more shiny the previous coat the more dead will be the flat. Old work should be gone over with the stopping knife, then rubbed with pumice-stone and water; greasy parts should be washed with turpentine,

and, where the paint is rubbed away, primed; cracks or holes should be stopped and hollows filled up, being left full to allow the stopping to shrink, and levelled off afterwards. The first coat should be mixed with turps, and the succeeding ones as before described. Woodwork intended for varnishing requires extra care bestowed upon it from the beginning to secure an absolutely smooth surface, and, after the fourth coat, should be applied one or more coats of French oil, varnish, or pale copal for delicate tints, being rubbed down between each coat with pumice-stone, powder and water, and a felt float to remove all inequalities. This can be repeated until the work has the finish of a coach-panel or Japanese-lacquer tray. Work of this kind is expensive, but very durable, and should be designed with this finish in view with very simple moulding and large plain surfaces. It is, in my opinion, only under these conditions that internal varnished work is tolerable. It would be unwise to treat the work of a new house in this way before it had got over its infantile diseases. If it can be so arranged, a good plan is to leave a house with three coats of paint and lining papers on the walls for a season or two, when the finishing decorations can be carried out with the satisfaction that they are being executed on a good basis. Often the contractor who builds the house is not the best man to employ for the decoration, and one set of men is conveniently got rid of before the other commences. Some of the most beautiful colours can only be obtained by "glazing," the term given to painting with a semitransparent colour mixed thin over an opaque colour. This is generally done with tube colours. In treating of house-painting, the subject of graining should not be omitted, although out of favour at the present. Personally, I dislike it, mainly for the reason that I never meet with any that is pleasant in colour. The merits justly claimed for it are that it wears well on account of its broken colour and varnished surface, and can be easily touched up without repainting. I see no reason why combed work, in colours not necessarily resembling wood, should not have a good appearance; also the merits claimed for grained work. I have some specimens for you to see which have been grained in one colour; then a second colour has been applied and combed whilst wet, and afterwards varnished. Another plan is to stipple the second colour, and then varnish.

WALLS.

New walls, if intended to be painted, should be plastered with Parian or Keene's cement, and should have two coats of white-lead and linseed oil and litharge mixed rather thin, to soak into the plaster and stop absorption; the third coat should be thicker and mixed with spirits of turpentine and colour, and the fourth thicker still, and mixed with equal parts of linseed oil and turpentine, with sugar of lead as a drier; the colour should be darker than intended to be finished. Each coat should be allowed to dry thoroughly before the succeeding one is applied, and should be well rubbed down with glass-paper. The finishing coat is best stippled with large flat brushes, as a granular surface is obtained, the wearing properties are not impaired, and the unpleasant reflecting surface is broken up. Any appearance of damp must have the cause removed, as no tinkering with the face of the wall will be a lasting remedy. Any patching or chases should be made good with Parian or Keene's cement, which can be painted soon after, provided that the bed or backing has been first painted with oil-colour to prevent the damp from the cement soaking into it. It is claimed for adamant plaster that it can be painted in twenty-four hours, but my experience of it is that this cannot be done with safety if cement has been used in the wall or floor, as the salt from the Portland will continue to come through for weeks after the plastering is done. The manufacturers recommend a wash of barium chloride, but this I have not tried. Another trouble which affects the finishing of walls is discolouration in patches where Fletton bricks have been used. I have spoken to the manufacturers about it, and I am informed that it is caused by using overburnt bricks, and that a bricklayer experienced in the use of these bricks would not make use of these overburnt ones for inside work. Considering the very large quantities now being used in London in place of stocks, it is very important that the matter should be understood, the only remedy being to cut the brick out.

WALL-PAPERS.

The most convenient way of finishing walls, and that most largely adopted, is covering them with printed wall-papers. It is a simple process, and may be quite inexpensive, and they are easily cleaned off and renewed. Skilful paperhangers are not difficult to find, so a badly-hung wall-paper should not be tolerated. The surface of the wall should be rubbed over with glasspaper to remove all excrescences, and it should then be clearcoiled, and the papers hung without joint from top to bottom, having their joints carefully trimmed and butted. On new walls it is a good plan to hang white lining paper preparatory to hanging a more expensive paper: this gives the latter a much better chance as far as discolouration from the fresh walls is concerned. Walls should be lined with brown paper before hanging embossed or strong papers, as otherwise they are liable to slide in shrinking, and open at the joints. It is a good plan also to line and clearcoil preparatory to distempering walls; it has an advantage over using a tinted paper ground, as the joints need not show, which they would do in the case of the latter. The varieties of wall coverings which may be suitably used for the space usually called the filling are numerous. Immense talent has of late years been employed in the designing of wall-papers until we almost have more than enough, and there is a temptation, when choosing from a number of ambitious designs, to forget that in most cases the wall on which they are to be hung should be looked upon as a background—a purpose for which many of them are eminently unsuitable, and if there could be more connection between the designing and the using of them, the designs and colourings would be very much modified. I am not now referring to the large flowered designs in natural colours which are exhibited in drapers' windows, accompanied by the notification that they can supply the chintz for hangings to match them. A less interesting arrangement I cannot conceive. A piece of English wallpaper is twelve yards long by 21in. wide, containing 63sq.ft. French paper is nine yards long and 18in. wide, containing 40½sq.ft., so in estimating the quantity required, half must be added to the measure for English papers, and the price considered in relation thereto. The simplest wall-paper consists of a pattern printed from a wood block, in repeats, with distemper colour on previously distempered roll of white paper, and in this form is suitable for use from the servants' bedroom to the principal reception-room, the dignity required depending upon the form of the design and colouring, and if we had nothing more than this we should still be very well off. The varieties of embossed coverings for walls now available in decoration are numerous. They have the merit, when hung on an ordinary plaster wall, of presenting a wearable surface, and one that is capable of decoration after hanging in various ways, either by painting all over, parti-colouring, rubbed out or stippled effects. The skill displayed in the Japanese leather papers in design, modelling, and treatment of the surface with metal and colours, made them very popular, and they have been used in place and out of place until we are rather overdone with them. A luxurious finish to a wall is covering it with silk damask or brocade, and this plan can be adopted with more propriety now the electric light is more general, and the dirt and discolouration from gas are got rid of. It may be treated as a continuous band round the room, or introduced in the form of panels. In either case it should be so arranged as to have a solid back to prevent the accumulation of dust behind it. Lastly, I may refer to the hanging of real tapestry, which has a value beyond any other wall covering, either as covering the entire wall, suspended from the top, or in panels. No other decoration is required, and a tinted white for the woodwork appears to give the best value to the tapestry colours.

FLOORS.

Following the order which I first laid down, we come to floors. The ordinary deal floor, by the process of building, gets so stained and disfigured, it is necessary, if any part is intended to show, to stain it a dark colour and varnish it. A border around the room enables a reversible square of carpet to be used, which is easily taken up and shaken. The reception-rooms should be laid with ¾in. oak parquet over the ordinary floor, which makes a very good job, provided the floor has got to its normal condition. It is best deferred for a season, as the best flooring will

sometimes swell and buckle, when, if laid, the parquet will follow it and present a series of corrugations. The usual plan for finishing the oak is to give it a "stiffener" of French polish, and then brush over with beeswax and turpentine. Plain linoleum of its natural reddish-brown colour will be found serviceable and pleasant for many of the secondary rooms of the house: it is very durable, and although I have heard something said about its rotting the boards through excluding the air, I have never found this to be the case.

PROCESSES OF PAINTING.

Before going on to the subject of colour, I may sum up in a few words the processes which I have been describing, omitting descriptions in detail of the materials, pigments, and vehicles used. Surfaces which have to stand wear should be painted with oil-paint composed of white lead, linseed oil, and driers. Zinc white is a purer white than white lead, but has not the covering capacity; it may be used with advantage for the finishing coats of light colours. Surfaces which do not come in contact with any bodies may be treated with less labour, and as good an effect, with distemper composed of whitening and size. Oil surfaces may be made more durable by varnishing, the degree of finish being a question of labour and expense. It is important for the stability of painted decoration that pigments of a fugitive nature should be avoided, also that their chemical action when mixed with another should be understood, and this subject has been treated of by W. J. Muckley in one of the handbooks of the Science and Art Department at South Kensington Museum. He therein gives a list of permanent, semi-permanent, and fugitive colours, and practice might very well be confined to the use of the first two classes, if not of the first. As house-painting must necessarily be renewed, there is not quite the same necessity for permanence as in a painted picture. The simpler the mixture of colours to produce the required tint the more likely it is to be satisfactory, and to keep its colour. I have read somewhere that the "quickest way to good colouring is through a short palette." The theory of colour is treated exhaustively in the work of M. Chevreul. "The Principles of Harmony and Contrast of Colours," and the works of Owen Jones on the same subject, with his series of propositions on the principles which should govern the decorative arts may also be recommended for study; but the best study for colour is the book of Nature, and to an enthusiastic student her instruction is infinite. Suggested schemes of colour are all around us. Clouds, the spring and autumn tints of trees, with their leaves back and front for colour or texture, the plumage of birds, vegetation on buildings, oxidising of metals, marbles—all present beautiful combinations which may be made use of, and an enthusiastic study of colour in the ordinary walks of life will well repay the time and attention given to it; in fact, my advice is. Train the colour-sense simultaneously with that of form and proportion. When an impression has been received, take the earliest opportunity of registering your recollection of it with your colour-box: it will then be ready for use when the opportunity occurs. In a

SATISFACTORY SCHEME OF DECORATION

the three primary colours, yellow, red, and blue should be in some degree represented, not necessarily on the walls of the room, but supplied by the hangings and furniture. They need not, however, be represented in their primary condition, but in the form of secondaries and tertiaries. The most useful colour for the background or walls is green, contrasting with the furniture of yellow or red browns, with blue introduced in the hangings. Yellow, being a primary colour, cannot be produced by mixture of other colours; it is an advancing colour, has great power of reflecting light, and, compounded with red, gives a range of warm colours, orange and brown. It diminishes in power by artificial light, and for that reason is difficult to make satisfactory for both day and night effects. It is a delicate colour as a pigment, and is easily killed by admixture with other colours. It contrasts powerfully with black, and may be represented by gold in a colour scheme. Red is the intermediate primary coming between yellow and blue, and in like intermediate relation also as to light and shade, white and black. It is a most positive colour, forming, in combination with yellow, the

secondary orange tints; and with blue, the secondaries purple, crimson, &c. It gives warmth to all colours, especially to yellow. In combination with yellow it becomes advancing, and with blue retreating. It is very much affected by the quality of the light in which it is viewed. Reds easily spoil one another side by side, and great skill is required to print one red on another satisfactorily. Red lights up by artificial illumination better than any other colour. Vermilion is the pigment which most nearly represents this primary. Blue is the third primary, and is best represented by the genuine ultramarine, which is said to be a true colour, neither inclining to yellow nor to red. Blue is a retreating colour. The blues most used, on account of the high price of genuine ultramarine, are cobalt and Prussian blue; but the former inclines to purple by artificial light, and the latter to green. These colours are very useful and pleasant in light tints for making greens, and in distemper, but as blue lights up so badly, it may well be represented in the colour scheme by curtains or carpet. Having gone through the usual processes in the decorating of a house, I will proceed to consider the points which should influence us in

SETTLING ON A DECORATIVE TREATMENT,

and will commence with the entrance-hall. If the house is sufficiently large, this often becomes a room, with its entrance lobby screened off and the staircase recessed from it or leading off from one side. It may contain an open fireplace, and the doors to the principal rooms open immediately out of it: it is therefore desirable that the colour should be considered in reference to the adjoining rooms. As the sunniest aspects are required for the living rooms, that of the hall is likely to be a northern one, and consequently a warm colouring would be best—a high wall panelling, or dark wall treatment to about the level of the top of the door architrave, with deep frieze of stencilled ornament in red tones, with an olive cornice and the ceiling a lighter tint of the same. There would be very little blue or cold colour in this arrangement, and the fireplace might supply this in form of blue tiles on a white ground and the grey metal of the stove. The old-fashioned crimson, blue, and green Turkey carpet would complete the colouring, with a surrounding of parquet floor, yellow stain being introduced in the window-glass. The red colouring could be carried up the staircase above a wall panelling, repeating the handrail on the wall side, or in the absence of this a wood moulding at this level, with the space below painted a greenish brown on a simple pattern of embossed paper. This gives a durable surface where the wall gets most wear, and the papering above may reasonably be left unvarnished, as, except on the score of durability, varnished papers have nothing to recommend them. The varnish changes colour, and becomes in most cases very unpleasant, and is more susceptible to changes of temperature than an unvarnished paper, a sudden change from a cold day to a hot one covering the walls with moisture. An oil-printed paper on an oil ground is a good substitute; it is pleasant in appearance, and can be sponged without harm. We seldom see the walls of a staircase panelled out in plaster or wood. It has a good architectural character, and it is astonishing what can be done with a few hundreds of feet of wood moulding judiciously disposed on the walls. It is tedious making a drawing of the four sides of the stairs, so the best plan is to set out the panels on the walls with a piece of chalk. Everything above dado level can then be distempered. Duresco is a good material for the purpose, using the petrifying solution supplied with it. It is more expensive than ordinary distemper, coming between that and oil-paint, but has the merit when hardened of being to some extent washable, and it is much less liable to discolouration from defects in the walls than ordinary distemper. It is also pleasant in appearance. The treatment of the walls of stairs suggested applies rather to old than new buildings.

WALLS.

In considering the horizontal divisions of the walls of a room, I have in mind the ordinary house, with rooms from 10ft. to 12ft. from floor to ceiling. The necessary skirting, if with about 6in. of plain face, is generally sufficient if of good thickness, with simple mould receding to the wall, thickness rather than height being required; this will keep the furniture away from the walls without considering what is called the chair-rail, which should in most cases be lower than the

back of a chair—from 2ft. 6in. to 2ft. 9in. to the top of it. The space between these two is best of wood, the face of it projected somewhat from the face of the upper wall. The skirting, plain or panelled face and rail, should either be of one colour or harmonising colours of the same depth of tone; to cut it up into thin lines is a mistake. Above this the wall may be plain and uninterrupted up to the frieze-rail. This, with the frieze and cornice, about one-seventh the height of the room, should all be designed together and kept to about the same tone of colour, of sufficient weight to look like part of the wall. In designing these mouldings, mould the top of surfaces below the eye, and the bottoms of those above the eye. Another division as to height is to increase the frieze with rail and cornice to about one-fifth of the height of the room, giving the extra space to the frieze, and if the room is very low, sacrificing or squeezing the dado. In a drawing-room this plan will be found convenient, as pictures being generally small will not look well if skied, and the ornamental frieze furnishes and gives interest to the upper part of the wall. If there is height enough, the cornice mouldings can be moderate in size to form the starting of a cove or hollow, connecting this cove with other mouldings to form the frame of the ceiling. The cove, so very general in the French work of the last century, is much out of fashion, but is undoubtedly serviceable in softening the connection between the decoration and walls and ceiling. If there is not height enough for a cove, the cornice kept down a few inches from the flat of the ceiling will give an opportunity, adding recessed mouldings, and preventing the sagging appearance of an absolutely flat ceiling. For bedrooms, the deep frieze arrangement is very suitable, either with or without the dado, according to the height of the room. It is a good plan, when arranging window-casings and architraves, to break the cornice out so as to form a boxing for the top of the curtains. The breaks have a good appearance, give good shadows falling on the curved surface of the curtains, and preventing the accumulation of dust. Wall surfaces should be squared up; a narrow slip of paper over door or window architraves is best got rid of, also the long spandrel piece over an arch. It is better to break it forward with a vertical line and break the cornice over it. Soffits of arches should not be left plain as ceiling, but should be treated same as arched mould. These are points which cannot well be carried out unless done at the time of building. I have often had to ornament a ceiling where all the mouldings have had to be suspended, as it were, on account of the fixed position of the cornice. In low rooms the plan of treating the whole chimney-breast as a feature instead of applying the chimneypiece is a good one.

DINING-ROOM.

The division of the wall space in this room might conveniently be by a wood skirting, plain face and rail, to a height of about 2ft. 9in. (pictures could then, if of large size, occupy the space up to the frieze rail), the cornice, frieze, and rail, grooved for picture hooks, being one composition. The heavy, Early Georgian type of cornice and dado always appears to suit a dining-room. If it gets the morning sun the main filling of the walls might be a wall-paper two tones of deep green, the ground being warm in tone, with a lighter and colder print. The paint a golden green, and the flat of dado a deep, rich red, inclining to crimson; cornice and frieze tones of citrine, and the ceiling a still lighter tone. If the owner of the house has any oil-paintings they are likely to be hung in this room, and the question of the best background colour has to be considered; this may very well be studied in the public galleries which we have access to, and that used in the entrance-hall of the National Gallery appears to me the most satisfactory. It is a flock paper printed in two tones of a mellow, dark green, inclining to olive. It is there very pleasantly contrasted with dull red marble columns. Both the colour and texture contrast well with the oil-paintings, and give the very greatest value to them. There are other colours adopted, including red, which is generally considered a good oil-picture background; but none appear to me so satisfactory as this. At South Kensington a dark, neutral green wall-paper of Morris's is very much used; but it appears to me too cold or grey for the purpose. The question whether the cornice of a room should be treated dark like the paint or light like the ceiling is always cropping up, and although

it is rather trying to darken some nice plaster work, which looks so fair in its natural white, I consider it should be treated with the walls, not necessarily so dark; but sufficiently so to prevent the sudden contrast from dark to light just below the cornice.

THE DRAWING-ROOM.

The decoration of this room should be bright and cheerful, and should light up well. (Here light or white paint is in place.) For this room the mistress of the house must be consulted, and the various parts thought out with furniture, hangings, and carpets to make the picture complete when furnished and occupied. Should the lady be a brunette, a cream paint and walls of a yellow tone may be suitable. If a blonde, a bluish grey or grey-green. The architectural panelling out of the walls of a room is but little practised now, although nothing gives such size and dignity to an apartment, whether by framing with large panels or by painted styles and rails. The tendency of late has been to ignore symmetry and to indulge in corners and recesses, and small windows in odd places, by which a certain picturesqueness is obtained, but unbecoming cross-lights are developed, and a mere prettiness without dignity is the result. There is little fear of stiffness in the drawing-room, and when the furniture and upholstery come, the severe lines of an architectural treatment of the walls will be pleasantly contrasted.

LIBRARY.

In this room a quiet, restful tone of colour should be aimed at, bearing in mind that books are the best ornamentation of the room, and choosing colours which will give value to their bindings. The fittings should be of hardwood, and as it is inconvenient to reach books higher than about 7ft. 6in., a rail at this level (grooved for picture hooks) may be conveniently carried round the room where the book-cases do not occur. A fairly strong green is the best to show off bindings, and this may cover the space above the bookcases with a deep vellum-coloured cornice and ceiling. The floor should be felted all over.

BEDROOMS.

The deep frieze treatment for these is generally most convenient, and the chief characteristic of the colouring should be freshness. Here white paint, which in sitting-rooms makes the furniture, hangings, and carpets look dirty, is in place, and should be the standard of cleanliness and freshness generally in the room. The space above the picture-rail looks quite well in plain distemper, but may have a running frieze in colours with good effect, and in the ceiling I would plead for a little ornamentation to relieve the absolute blankness, which is so very general. Colour is too subtle and indefinite to talk about with advantage. Colour is relative; there is no such thing as a bad colour when regarded alone, as there may be a situation where that particular colour would be the best in combination with others for its position. A parti-coloured suit will keep fresh longer than a suit of one colour, and the same holds good in decoration. Contrasting colours enhance the value of one another, and it is quite possible by altering one colour in a decorated wall or ceiling to give freshness to the whole which before may have looked dirty and worn out. The coloured decoration of a room should be the conception of one mind, and the plan I advise is to make your scale sketch and stick to it as you would to your $\frac{1}{2}$ scale drawings in a building. In practice this cannot always be carried out, and it comes to doing the best you can under the circumstances. What I should like to impress upon all who are not in the habit of doing so is that a constant study of colour brings great enjoyment with it. The critical faculty can be used everywhere. As you study old buildings to improve your sense of form and proportion, study natural objects for improving your colour sense. The most unlovely object, if left alone, will be covered by nature with the most beautiful colours, and the book is open for our delight.

At the close of the paper a vote of thanks was accorded to Mr. Shuffrey, on the motion of Mr. WALTER J. N. MILLARD, seconded by Mr. COLE A. ADAMS, and supported by Mr. MAURICE HULBERT and the President.

The restoration of the tower and spire of the parish church at Lenton, South Lincs, has now been completed, and a lightning conductor has been affixed.

NOTES ON SURVEYING AND LEVELLING.—X.

By WALTER TESTER.

THESE notes will now be brought to a conclusion with a few general remarks on the drives and walks, lake, &c., not already mentioned. The accompanying plan shows the main features of the scheme for the New Brighton Tower and Recreation Grounds, and if it is compared with the plan published in the article on the survey of the site, it will be noticed that several additional pieces of ground have been obtained, the boundaries of which the surveyor has

no difficulty in tying on to the original site, with measurements.

There are two approach roads to the Tower buildings, one from the river front and the other from Egerton-street near the old entrance gateway, and their routes are chosen so as to necessitate as little destruction as possible of the trees standing on the ground, and with this object they are joined into the existing drives to the old stables and house. Any excavation for forming the roads to the required gradients can be arrived at by taking short sections across the route of the proposed roads, the ground in places being very uneven.

So far as the positions of the section-lines are concerned, it would be impracticable to make them square off the bends of the roads, on account of the setting-out, and also it would be more difficult to take out the quantity of excavation as the width between the lines would be variable, and the easiest way that suggests itself is to make the sections parallel to each other, and square off longitudinal straight lines made to follow the direction of the roads, the angles which the longitudinal lines make with each being taken with the theodolite.

Pegs are left in at each end of the lines, which are run out a sufficient distance to be clear of the

cutting. The sections being plotted down, and the position of the road and formation-level being shown on, an estimate of the quantity of excavation can be obtained.

After the roads are cut, the position of the top and bottom edges of the side-slopes can be measured from the pegs left in at the ends of the sections, and the cubical contents of the cutting as actually carried out can be arrived at.

There will be a slight variation at the junctions of the longitudinal lines, two adjacent sections not being parallel, and it will be necessary for the quantities to take the width between the centres of gravity of the areas of excavation of the two sections, as the strip to which the lines apply, as explained for the Tower site. The road around the Tower buildings has already been dealt with, and the positions of the walks in various portions of the site are chosen on the ground. They do not require any sectioning, and they can be surveyed after they are made in the manner described in the article on the survey of the site.

The old pond existing on the ground is extended to form a small lake as an ornamental feature, the outline of which is determined on the site, being adapted to the natural features, the surveyor marking it out with pegs and afterwards making a survey of the line of pegs, and as the ground is very irregular at the point where the extension lies, and the excavations could not be easily measured otherwise, the surveyor has to take sections, making them square off a line along the approach road to the main buildings, which also serves for the survey and sections of the new road where it coincides with the old drive. These lines fulfil the necessary requirements, being parallel to each other, and about square off the longitudinal axis of the lake, and give typical sections of the ground. The surveyor runs his lines out a sufficient distance, and leaves a peg in at each end, and plots his sections, puts on the position of the cutting and level of the excavation for the bottom of the lake, forms an estimate of the quantity of excavation, and adjusts any variation in carrying out by measuring the position of top and bottom edges of the slopes, after the cutting is done, from the pegs left in at the ends of the lines, which are not disturbed by the excavation.

As the positions of the walks around and in the immediate neighbourhood of the lake are settled on the site after they are fixed, the surveyor can run lines along the walk around the lake, joining in to the line along the approach road used for the sections, to form a closed figure, and can take the angles with the theodolite and check them by adding up, making a survey of the path and edge of the lake by offsets in the ordinary way. The lines for the other walks can be tied on to those already fixed by angles taken with the theodolite, and can be surveyed in the same manner. So far as the other blocks of buildings are concerned, they present no difficulty, as they can be set out by ordinary methods, and anything further in connection with the surveying operations can easily be performed on the principles already explained.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—XIII.

By an Assoc. Inst. Elect. Eng.

ARRANGEMENTS OF CIRCUITS—(continued).

ALTHOUGH the reversed parallel and loop systems do much to equalise the fall of potential throughout a circuit, it is necessary to point out that such arrangements for enabling the current supplying each lamp to traverse the whole circuit is not effective in preventing an unequal fall of pressure, unless the lamps are distributed uniformly throughout the circuit. Thus, in Fig. 23 a case is represented where the pressures are not equalised if a larger current is taken off at one point than another.

As in the figure, let us suppose that at a point A, 500 lamps are supplied by current from the mains, and only 10 lamps at B, a point 200 yards from A. Then, if the 500 lamps require C amperes, whilst c amperes are sufficient to supply the lamps at B, and if R be the resistance of A B or A' B', the fall of pressure from A to B will be cR, whilst the fall of pressure from A' to B' will be CR; therefore, the pressure at B will be greater than at B' by an amount equal to (C - c) R. To take a numerical example, suppose each lamp takes 0.75 amperes, and that R = 0.0032 ohm, then the difference in the falls of pressure is $(500 \times 0.75 - 10 \times 0.75) \times 0.0032$

$= (375 - 7.5) \times 0.0032 = 1.176$ volts. It will be observed from the figure that the case just considered is part of a reversed parallel arrangement, and it is obvious that to have an equal fall of pressure on both mains, the sections of the mains must be made proportional to the currents,

FIG. 23.

such that $CR' = cR$ where R' and R are the resistances of A' B' and A B respectively to give equal falls of pressure:

Modification of the Multiple-Series System.—In the multiple-series system described in Article XII. it is obvious that both the lamps in series forming any one group must be in use at the same time, unless an idle resistance be introduced as a shunt to the lamp not required. Independence of each lamp is, therefore, not secured, since each group possesses the disadvantages and limitations of an ordinary plain-series circuit. In small installations, however, where the load is a fairly constant one, a simple modification of the multiple-series may readily be introduced. The

FIG. 24.

modification is indicated in Fig. 24, from which it will be seen that a third wire is introduced without being connected to the generator. As before, the generator must give twice the pressure required by each lamp, and the advantages of using a third wire are as follows:—(1) It enables less copper to be used, (2) it enables a high voltage to be used, and (3) it secures the independence of each lamp.

By remembering that the dynamo gives a constant pressure, it is easy to trace the function of the middle wire. If one lamp be taken out, the others are not affected. Suppose, for instance, that there is one more lamp in use between M

FIG. 25.

and N than between P and M, then the joint resistance of the lamps between P and M will be greater than between M and N, and the fall in pressure between P and M will be greater than between M and N, the pressure between P and N remaining constant, so that the actual potential of the middle wire M is not precisely midway between those of the mains P and N. With the same number of lamps on the two sides of M, however, the potential of M is exactly midway

between those of the outer mains. It is, therefore, evident that the pressures required by the two sets of lamps are automatically regulated to the number of lamps in use, and for factories and private installations with fairly constant loads, the arrangement is both economical and serviceable.

Probably the best arrangement for giving constant pressure with a plain parallel system, however, is to use a battery of accumulators in conjunction with a shunt-wound dynamo, as shown in Fig. 25, in which D is the dynamo. It will be observed that the battery is connected in parallel with the generator, and that means exist for increasing or decreasing the number of cells in use, BS being a battery regulator-switch, which will be described when dealing with switchboard appliances. The chief function of the battery is to regulate the voltage and maintain a constant pressure between the mains. In this respect they are used as flywheels to smooth down irregularities in the pressure of supply. In addition to this, however, they supply the energy for the lamps during periods of light loads; they are also able for a short time to take the place of the generator should any breakdown occur, or when it is desired to use lamps without running

FIG. 26.

the generator. This is a decided advantage when the dynamo is installed in the cellar, or in such places where the vibration and noise may be objectionable. Then, again, the cells may be charged at convenient times, and are always ready for use. When used in conjunction with a dynamo they act as reservoirs, since they store energy when there is an excess, and give the same out again when required. The working of the arrangement is simple. It is obvious that if the E.M.F. of the battery is less than the voltage of the generator, the cells are charged at the same time that the lamps receive the necessary current. When the two pressures are equal, both the generator and battery feed the lamps. In the extreme case, when the battery pressure is greater than the voltage of the generator, the battery reacts on the generator, and at the same time feeds the lamps. To understand this reaction, we must remember that the generator is a shunt-wound dynamo; consequently, in this case the tendency is to increase the excitation of the field-magnets, and so produce a stronger magnetic field, the effect of which is to increase the voltage of the generator.

We are now in a position to refer to the methods of house-wiring with parallel circuits. There are, broadly speaking, two systems—(1) the tree system, and (2) the distributing-board system. The former, which is shown diagrammatically in Fig. 26, is probably the most common, and certainly is the method adopted in all the earlier installations. The origin of the name is

evident, since the main cables in the system correspond to the trunk of a tree, being placed in the most central position of the house. From this the branch circuits are taken off as required, after the fashion of the branches of a tree, into the different rooms of the house. The lamps are then placed between smaller mains taken from the branch mains, and these correspond to the twigs and leaves of the tree. From the figure

Fig. 27.

it is clear that there is only one set of mains through which the main current passes, and since the various rooms are at different distances from the source or point at which the current is received from the supply company's mains, it is obvious that the different groups of lamps are not fed at the same voltage. The fall of pressure is, of course, increased with the length of the main cable, and since it is objectionable to allow one circuit—the trunk of the system—to carry too large a current, this method of house-wiring is defective. It must also be observed that each branch circuit is controlled by a switch, as is also each lamp.

For installations containing a large number of

Fig. 28.

lamps the second system is undoubtedly the better one to use. It is termed the distributing-board system, because the source of supply is connected directly with a distributing-board, from which separate and distinct distributing mains are taken to each room. The lamps are

thus divided into groups, each with its own sub-mains. If the groups consist of a large number of lamps, each group is subdivided into subcircuits, and has its own distributing-board. In America this system is known as the *closet or panel* system, because the secondary switchboards are often placed in closets or behind panels. In special cases where it is essential to use one or more high candle-power lamps (say 100c.p. lamps), it is obvious that it should have its own branch connected to the secondary switch-board, so as to be distinct from the other circuits. And in cases where the lamps are distributed throughout a building with a number of floors, it is clear that a separate distributing board on each floor, if not in each room, will be advantageous. In many cases, also, it is necessary to control the lighting of sections, and this can best be done with the distributing-board system, for then each section is independent of all others. The ring method of arranging the leads is particularly adapted to this system of wiring, which will be readily understood from Fig. 27. The following advantage of the distributing-board system over that of the tree are apparent.

1. The junctions with the main cables are more accessible.
2. The insulation is vastly superior.
3. The distribution of electrical energy is more under control.
4. The fall of pressure is more readily equalised, since the distances from the distributing centres are reduced.
5. The ease with which each group may be tested is much greater.
6. There is less possibility of increase of temperature at the junction of the branches, and therefore less danger of fire.
- (7) And although more wire is required and the first cost is greater, the convenience, control, and independence of each group which are secured, more than repay the additional outlay.

Whilst we are dealing with house or interior wiring it will be well to refer to a special arrangement for turning a lamp on and off at two places. Fig. 28 II, for instance, gives an ingenious and simple arrangement of wires and switches that would enable a staircase lamp to be turned on or turned off from either the foot of the stairs or from the head of the stairs. The principle employed will be understood from Fig. 28 I, and the following description:—F and H are two-way switches placed at the foot and head of the stairs, *a*, *b*, *c*, and *d* are contact studs; *a* and *c* being joined by the cable *e*, *b* and *d* by the cable *f*. If the two lever arms are on *a* and *c*, the circuit is closed and the lamp will be lit. On moving the switch arm from *a* to *b* the circuit is broken. It may, however, be closed again from either side by moving one or other of the switch arms, so that the lamp may be turned off or on either at the foot or head of the stairs.

STABLE CONSTRUCTION.*

THE sanitary construction of stables is a question that should receive greater attention than it has done. We are often astonished at the condition of many London stables where omnibuses and other horses are housed. Local authorities have done something to remove the reproach of some of the disgraceful structures that once served the purpose of stables and cowhouses. Any dilapidated shed once sufficed, and as for the sanitary stall, the less said the better for our humanity. Mr. T. E. Coleman, F.S.I., M.S.A., whose series of articles on this subject recently appeared in the *BUILDING NEWS*, has published them in a book form, with necessary modifications. Those of our readers who have read the articles as they have appeared will be glad to have them in a compact form for handy reference, while others who have not read them, or have only casually glanced at them, will highly appreciate the author's work. Mr. Coleman has studied this particular branch of his profession. His work on "Sanitary House Drainage" is well known, and he here describes and illustrates the most approved types of stable plans and fittings. Considerable space is given to the subject of ventilation, natural and artificial. The volume of air required by a horse when at rest is put at 2½ c.ft. per hour, and the author gives Dr. de Chaumont's

formula to find the necessary amount of fresh air to be supplied per hour for each horse, and he observes that for general purposes an allowance of 10,000c.ft. of fresh air per horse per hour will be sufficient as a minimum quantity for healthy horses. We should like to know how many stables provide even this minimum in our towns. This allowance, divided by six, the required number of changes of air per hour, gives 1,666c.ft. as the minimum cubic space per horse. Those interested in stables and stable construction will find many examples of plans of stalls and loose boxes, sections, details of inlet and outlet ventilators, stable fittings, paving, and drainage, and we highly recommend Mr. Coleman's treatise to architects, estate agents, and others.

"THE HOUSE COMFORTABLE AND THE HOUSE BEAUTIFUL."

WE have received a new album of photographs under the above title from Messrs. Graham and Banks, of 445, Oxford-street, W., in which the architectural fittings and furniture of the house have been illustrated by the aid of pen and camera. Messrs. Graham and Banks are designers and manufacturers of high-class furniture and interior fittings, and their photographic illustrations show a superior kind of treatment to that we often see. As specialists they cater for houses of the simplest as well as the most costly kind, and the system they work upon ought to be productive of the best results. One of the interiors shows a room in the François I. style, which is on view at the firm's Oxford-street premises. We notice a certain refinement in the detail and furniture. The drawing-rooms, in the Louis Seize style, have also this quality, and a pleasing breadth and quietness. Following is an oak-panelled room with tapestry frieze; also a bedroom with white furniture, inexpensive and quiet. The French furniture, of which the manufacturers have a large stock, comprise old and modern examples from Louis XIV. to Louis XVI. These include many choice and elegant specimens of tables and chairs, cabinets, writing-tables, all designed upon good models in satinwood, mahogany, &c., inlaid and carved furniture designed after Sheraton, Chippendale, and others. Some very simple and inexpensive designs are shown for sideboards, hall-tables, and stands in oak or walnut, also in chairs, bedroom suites, wood chimney-pieces, parquet floors, wall and ceiling panellings in joinery. These moulded rib panellings for ceilings and walls can be fixed on existing ceilings at from 1s. to 2s. 3d. per foot super. The system adopted by this firm of inspecting the house before furnishing designs or estimates, is the only right one. Messrs. Graham and Banks will be pleased to send a copy of their album to any readers of the *BUILDING NEWS* who may apply for one, and they are prepared to carry out architects' designs. Every design illustrated is marked with the price—a consideration of moment to many.

BRICKWORK TESTS.

THE report of the third series of experiments on brickwork conducted by the Science Standing Committee of the R.I.B.A. is published in the *Transactions* of that body. The experiments were made on twenty short lengths of brick walls, each about 6ft. high, 27in. long, and 18in. thick. The tables, illustrated by photo-blocks of the different samples, have been prepared by Mr. William C. Street, F.R.I.B.A., and Mr. Max Clarke, A.R.I.B.A., and the appendices by Professor Unwin, F.R.S. A careful analysis of these tests would be of value. Till some rules are formulated from a generalisation of the results, the practical architect will have to exercise his own judgment as to safe limits of pressure. From a general study of the tables it would appear that the crushing resistance of piers of brick in lime mortar varies from one-sixth to one-eighth of the resistance of the brick itself; in cement mortar the resistance varies from one-half to one-fifth of the brick strength. From this it is concluded that "while cement mortar must very materially aid the weaker bricks in their combined strength, it cannot materially affect the ultimate power of resistance in brickwork made of a harder variety." The diagram showing compression of walls shows how the mortar is compressed. The bricks averaged in thickness 2½in., and the total thickness of mortar beds was 6in. The compression

* Stable Sanitation and Construction. By T. E. COLEMAN, F.S.I., M.S.A., &c. With illustrations. London: E. and F. N. Spon, Ltd.

of lime mortar beds averaged lin., that of the cement mortar beds about $\frac{1}{2}$ in.; thus it is concluded the mortar was well crushed and disintegrated long before the final collapse. The photographs taken show the mortar flowing out at the moment of collapse. It is noticed also, as to the working load that may be calculated upon, at one-fifth of the crushing load the compression in lime mortar averaged $\frac{1}{4}$ in. in 6 ft. of brickwork, in cement mortar it averaged $\frac{1}{8}$ in. The report further states: "If we take a safe load, or one that would not materially damage the structure, as one-fifth of the crushing load, it may be assumed from the results that in lime mortar 1 to 2, stock brickwork is equal to about $3\frac{1}{2}$ tons, Gault 6 tons, Fletton 6 tons, Leicester red 9 tons, and Staffordshire blue 23 tons per square foot. In Portland cement mortar 1 to 4, stocks would be equal to about 8 tons; gaults, 10 tons; Flettons, 11 tons; Leicester red, 17 tons; and Staffordshire blue, 24 tons per square foot. This is only a general assumption." The influence of form upon strength appears to be slight, the height in practice being divided by each floor. The effect of age is also not very marked. The tables show that the piers built three months gave similar results to those of five months old. The tables are interesting as studies, and the photographic illustrations give some idea of the behaviour. To take a few general results. A wall 6 ft. $1\frac{1}{2}$ in. high, 28 in. by 18 in., built 23rd Oct., 1896, crushed 30th March, 1897, split badly and face flaked at 142 lb. per sq. in., or 63.19 tons total pressure with a compression in inches of $\frac{3}{32}$. A wall of same height and size, of stock bricks from Sittingbourne in lime mortar, cracked at 162 lb. per sq. in., the compression $\frac{1}{16}$ in. Another example of gaults in mortar failed at 235 lb. per square inch. A wall of Leicester reds in mortar failed at 320 lb., another of the same bricks failed at 330 lb. A Fletton brick wall in mortar failed at 230 lb. One Portland cement mortar (1 to 4) example of stock bricks (Sittingbourne) failed by shearing at 310 lb., another at 315 lb. It cracked near centre. Another of Ellistown red bricks collapsed at 600 lb.

CHIPS.

Sir William Richmond delivered a lecture on "The Mosaics of St. Paul's Cathedral" at the Hammersmith Town-hall on Thursday in last week. There was a large attendance, Prebendary Snowden presiding. In the course of his address, the lecturer traced the history of St. Paul's from its inception, dealing in detail with its associations, artistic and other. He dealt at length with his works of art in St. Paul's, giving explanations of the various subjects depicted.

The Earl of Rosebery, with a deputation of the subscribers, attended at the Court of Common Council in the Guildhall on Thursday night, to present to the Corporation a portrait of the late Rev. Prebendary William Rogers, rector of St. Botolph, Bishopsgate, to be hung in the art gallery of the hall. The artist was Mr. A. S. Cope.

At the village of Norwood Green on Saturday the opening took place of the Ellis clock tower that has been erected in the village. The tower has been raised by members of the Ellis family to serve the double purpose of a Queen's Diamond Jubilee memorial and also to perpetuate the name of the late Mr. Ephraim Ellis. The tower rises to a height of 55 ft., and contains a valuable four-dial clock.

At the Municipal Art Gallery, Oldham, on Friday night, the Right Hon. Sir J. T. Hibbert, K.C.B., was presented with his portrait. The painting has been provided by public subscription to commemorate the services rendered by Sir John to the town, of which he is a native, and which he represented in Parliament for many years. The work was intrusted to Mr. J. J. Shannon, and Sir Hibbert is in official uniform.

The engagement is announced of Mr. Leonard Stokes, F.R.I.B.A., President of the Architectural Association 1889-90-91, third surviving son of the late Mr. Scott Nasmith Stokes, for many years one of her Majesty's Chief Inspectors of Schools, to Miss Edith Gaine, elder daughter of Mr. W. E. F. Gaine, of 100, St. George's-square, S.W.

Mr. Joseph Howard, M.P., opened the Tottenham Polytechnic at Grove House, High-road, Tottenham, on Friday night. The building, which has been acquired at a cost of about £6,000, is the joint property of the Technical Education Committee of the Middlesex County Council and the committee of magistrates, and will serve as a polytechnic and a magistrates' court-house. The polytechnic will accommodate at least 1,200 students. The whole cost has been provided out of the money derived from the Customs and Excise Act of 1890.

Building Intelligence.

BARRY.—A block of buildings, situate near Court-road, Barry Dock, was opened on Monday as public abattoirs. It supersedes an old wooden building, erected in 1889, in order to obviate the necessity of the Barry and Cadogton local board granting licenses for private slaughter-houses. The surveyor to the urban district council (Mr. J. C. Pardoe) visited nearly two years ago the most important towns in the kingdom, and ultimately recommended the erection of public abattoirs on the slaughter-hall principle. The surveyor prepared plans of the present buildings, which have cost about £6,500. The buildings comprise slaughter-hall, cooling-room, and lairs for cattle, sheep, and calves in one block, and similar buildings for pigs, together with caretaker's office, drying-room, gut-cleaning room, latrine and urinal, and also a caretaker's house. Rails are provided through the building with travelling pulleys, so that carcasses can be conveyed from one building to the other, and thence to a weighing machine. The contractor for the building was Mr. George Rutter, Barry; the ironwork was provided by Messrs. W. A. Baker and Co., Newport, Mon.; and asphaltic roadways were constructed by the Val de Travers Asphaltic Company. The slaughter-halls and cooling-rooms have dadoes 4 ft. or 5 ft. high of white glazed bricks.

BRAMPTON, CUMBERLAND.—Considerable additions and improvements have been made to the Presbyterian Church at Brampton, under the supervision of Mr. T. Taylor Scott, F.R.I.B.A., architect, of Carlisle, and on Sunday in last week reopening services took place. The exterior has been restored and new sanitary arrangements executed. A large number of internal improvements have been made, the most conspicuous being an oak pulpit of Gothic design with oak stairs and balustrade at either side, continued to form the rails at the sides of the Communion table on the raised floor above the church. The Communion table and minister's seat are also of moulded and carved oakwork. The choir-seats have been constructed in front of the pulpit slightly raised above the congregation. The internal decoration has been carried out in light warm tints to harmonise with the surroundings. New floors have been laid and the seats renovated and varnished, also new gas-fittings provided and the lighting improved.

CARDIFF.—The completion of the work of restoring the tower of St. John's Church was celebrated on Wednesday in last week. In 1473 the foundation-stone of this fine tower was laid. It was designed by one Hart, the architect who designed the towers of Wrexham and St. Stephen's, Bristol. These three towers are all of the Perpendicular style, but St. John's is not so rich as the other two, possibly owing to a lack of funds. However, Hart placed his ornamental and expensive work where it can be seen from most parts of the town. The embattled parapet with its pinnacles has since been a landmark in Cardiff. The S.W. angle turret was struck by lightning in 1860, and was rebuilt by Mr. Shepton's father. The tower before the recent restoration was in a bad condition, the top portion being dangerous. The restoration included the taking down of about half of the embattled parapets and rebuilding the same, and also the taking down of about 25 ft. from the top of the north-west and south-west buttresses, which had broken away from the walls entirely. While these buttresses were being rebuilt the lofty angle pinnacle was held up with chains from the opposite angles. The windows were all restored where perished, and the whole of the tower from top to bottom was pointed down. The walling was made good, a new lead flat was laid, copper stays being fixed in place of iron; the floors over entrance and under ringing-loft were groined in stone on the old corbels, which were built in when the tower was erected, the tower floor was carried down to the original level, inside and out, and an area formed in the street inclosed with a wrought-iron railing to show the original level. The walls which blocked up the north and south archways have been removed and the arches restored, with gates inserted, and new swing-doors have been constructed in the entrance to the nave, and so arranged as to exclude draught. The west window has also been restored and reglazed. The work has been carried out by Mr. Shepton under the

superintendence of Mr. C. B. Fowler, F.R.I.B.A., of Cardiff. The glass was supplied by Messrs. Savell and Co., of London; the wrought-iron gates and railings by Messrs. Letheren and Son, of Cheltenham (who are also making the whole of the gates and railings for inclosing the graveyard); and the carving was executed by Mr. W. Clark, of Llandaff. The tower has been lit by electricity throughout by Messrs. Lewis and Fletcher, Cardiff.

CHARING CROSS ROAD, W.—Mr. W. G. R. Sprague has planned the new theatre which is to be erected for Mr. Charles Wyndham in Charing Cross-road. It will have a frontage on the thoroughfare of 85 ft., and the decorations will be of Italian Renaissance character. On the pit level there will be nine rows of stalls, numbering altogether 220, and 160 dress-circle seats will be provided. The holding capacity of the building is estimated at over 1,200 persons, and the width of the auditorium will be 54 ft., and the depth the same. There will be eight private boxes, and a special retiring-room will be provided for royalty, with a private entrance leading direct from Charing Cross-road. The vestibule will lead into a crush-room, in size 30 ft. by 20 ft., and saloons will be provided throughout the building, and a lounge on the balcony level. On the second tier is arranged a balcony, and slightly set up over this, but forming part of the same tier, will be the gallery. The stage is over 30 ft. deep and 60 ft. in width. The main entrance will be at the topmost corner of Charing Cross-road. The new theatre will be opened next autumn. The total cost is estimated at £30,000.

DEPTFORD.—The new Broadway Theatre at Deptford will be opened by Miss Cissy Grahame on Boxing Day afternoon. The building is Classic in type, and is executed entirely in white Portland stone. The main corner is treated in the form of a tower, and is surmounted by a copper dome. Above this rises a miniature cupola, in which revolves a search-light. The heads of Shakespeare, Mozart, and Beethoven are carved in medallions above the doors leading from the grand saloon to the first gallery level. A carved frieze, 4 ft. 6 in. deep, is carried right round the building, on the second floor level. The entrances to the better parts of the theatre are from the main corner into a semicircular vestibule, and thence direct into a crush-room, the walls of which are partly lined with marble. From the crush-room the private boxes, stalls, dress-circle, and balcony are reached direct by short flights of steps. The auditorium has a depth of 30 ft. on the pit level from the curtain line to the back wall, with a clear width of 60 ft. The stage is 80 ft. wide, with a depth of 40 ft. The dressing-rooms are a separate block, about eighteen in number, and they are fitted with hot and cold water, bath-rooms, &c. Saloons and retiring rooms are provided for each section of the audience, the grand saloon being specially treated. Its size is 30 ft. by 30 ft., with circular ends. From this saloon visitors will have access to a balcony projecting over the main entrance. The decorations are throughout in the Italian Renaissance style, and in lieu of the usual gold, different tints of bronze and silver are used. The electric light has been made a special feature in the decorations, extra lighting power being so arranged that many novel effects can be obtained in the case of pantomime and other spectacular productions. The electric apparatus is in a separate building in the rear of the theatre. The furnishing and draperies throughout are of old rose gold. An asbestos fireproof curtain has been provided, and hydrants are fixed throughout the building, which is heated by a low-pressure hot-water apparatus. The building has been designed by Mr. William G. R. Sprague, and erected under his personal superintendence. The site has frontages on New Cross-road and Tanner's-hill, directly facing the Broadway. The erection of the theatre has cost £35,000, and its holding capacity is over 3,000 persons. The act-drop is from the well-known picture by Seymour Lucas, A.R.A., of Peter the Great working out his apprenticeship in the dockyard at Deptford.

EDINBURGH.—East Preston Street Public School was formally opened last week. It occupies a site at the corner of East Preston-street and Dalkeith-road. Designed with Flemish features, the building is devoid of external ornamentation, but is constructed of red stone with grey horizontal bands at different levels, and showing gables, dormers, and a central belfry on the edge of the roof. It is three stories in height,

and will accommodate 900 children—488 juveniles and 412 infants. Internally it is divided into two equal halves by a central corridor. On the street floor are five infant classrooms, accommodating from 63 to 75 children each. The site cost £3,538, and the expense of building and furnishing the school is put down at about £12,000; total £15,538, which works out at £15 per child accommodated. Mr. R. Wilson was the architect.

LEEDS.—The south avenue, the first completed section of the Grand Arcade, was opened on Saturday last, and the other sections will be finished in about a month. The grand arcade unites New Briggate and North-street. Lower Merriion-street forms the boundary on the north, and on the south the arcade is separated from the Grand Theatre by a cartway. There are two main avenues, and a transverse avenue entered from Lower Merriion-street. Of the two parallel avenues, one is 286ft. and the other 263ft., and both are 18ft. wide. The cross-arcade is 105ft. long by 15ft. wide. The façades to New Briggate and North-street are carried on wrought-iron boxed girders resting on polished red granite piers placed between the shop windows. Over the shop windows are mullioned bay windows. The upper portion of each façade is divided into three gables, which are broken up by moulded strings and cornices, and surmounted by pediments. There are two entrances from New Briggate and North-street under semicircular arches, each being 16ft. span and 24ft. high. These arches, together with the arcades, are faced with faience of varied tints. The bay windows over the shops, the gables, and the general walling of the Briggate and North-street front are faced with red and buff terracotta. The front walls over the shops are set back 1ft. 9in. on either side, thus making the span of the glazed iron roof 21ft. 6in., which is 3ft. 6in. wider than the floor of the arcade. The floors of the arcades are laid with marble mosaics of light tints, with bold border lines. The roofs over the shops are covered with sea-green Westmoreland slates. The entrances will be closed at night by wrought-iron gates, which can be lowered into the basement or raised up into the arcades themselves to form grills therein. Altogether, there are 56 shops, 24 of which are in the arcade opened on Saturday. Electricity is the illuminant. Messrs. Smith and Tweedale, South-parade, Leeds, are the architects.

LONDON.—The new Metropolitan Music-Hall, which has been built on the site of the old hall, and designed by Mr. Frank Matcham, was opened on Monday last. The exterior is imposing, from the granite plinth to the lofty minarets. For the front elevation, Mansfield stone has been chiefly employed. The principal entrance leads into a marble vestibule, paved with ceramic mosaic, with a lofty dome-shaped Moresque ceiling, with Moorish decorations. The decoration of the interior, which includes that of the fireproof curtain, has been carried out in the Flemish Renaissance style, the painting being almost entirely in various tints of ivory liberally embellished with gold, the most striking feature being a quartette of pictures in the four coves of the ceiling containing between 50 and 60 life-size figures, and illustrative of "Old English Merry-making," "An Italian Festival," "French Carnival," and "Spanish Revelry."

METROPOLITAN ASYLUMS BOARD.—At Saturday's meeting of this authority Mr. Elliott moved the adoption of a report of the children's committee recommending the purchase of a site comprising 49 acres at Swanley, for the erection thereon of a school for children suffering from ophthalmia, at a cost of £5,050. The land had, he said, been valued by a competent surveyor, who had endorsed the opinion of a sub-committee that it was the best of the sites which had been offered in response to the committee's advertisement. The recommendation was agreed to. The works committee presented plans prepared by Mr. Edwin T. Hall, F.R.I.B.A., of the chief office buildings to be erected on the Embankment site, and the architect's descriptive report. The architect's rough estimate of the cost of the new chief office buildings, including foundations and detached ventilating tower for the railway tunnel opposite, was £49,543. The committee recommended that the plans be approved and adopted, and forwarded to the Local Government Board for their formal sanction under seal. Mr. Purchase remarked that the original estimate for the buildings was £30,000. In the

case of the Brook Hospital the original estimate was exceeded by £50,000. He trusted that there would not be a similar excess in this case. The Chairman said the increase had been brought about by the fact that since the original estimate was given other important work had been entrusted to the board. The recommendation was agreed to, and it was resolved to apply to the Local Government Board for a provisional order authorising the expenditure of £40,000 in respect of the erection of the new chief office buildings, and empowering the managers to raise the amount on loan.

CHIPS.

The urban district council of Rugeley have adopted plans by Mr. E. Pritchard, C.E., of Birmingham, for sewerage the town, at an estimated cost of £12,000.

Mr. Forest A. Coburn, senior member of the firm of Coburn and Barnum, architects, of Cleveland, Ohio, died in that city on December 1. He was a native of Lowell, Mass., but removed to Cleveland in infancy. He studied his profession in Cleveland offices and in New York City with the late Richard M. Hunt. He had been secretary of the Civil Engineers' Club of Cleveland for the past three years.

On Thursday, the 16th inst., in the Tunbridge Wells County-court, before his honour Judge Emden, was heard the case of "Hannah Worrell v. The Mayor and Corporation of Tunbridge Wells," a claim for £210 damages in respect to the death of the husband of the plaintiff, a labourer in the employ of the Tunbridge Wells Corporation, who met his death by the sudden collapse of a trench on the Southern Sewage Farm. A verdict was given for the plaintiff with costs, on the ground that the work was proceeding in made ground, and should have been protected by timber shoring.

It is a curious coincidence, says the *City Press*, that on the walls of the old Council Chamber, where the inquiry in the great fire in Cripplegate has been held, are displayed the portraits of many of the judges who carried out the irksome duty of deciding claims to lands devastated by the historic Fire of London in 1666. The likenesses, it will be remembered, were painted at the expense of the corporation to mark the City's appreciation of the services rendered to the one square mile by these legal luminaries.

At a public meeting, held at Cardiff, on Saturday, under the Presidency of Lord Windsor, it was resolved to place a memorial of the late Dean Vaughan in Llandaff Cathedral, and that it should take the form of a recumbent effigy of the late Dean.

At the town-hall, Barnsley, on Friday, Mr. R. Deane Sweeting, an inspector of the Local Government Board, held an inquiry into an application of the Barnsley Town Council to borrow £6,416 for the purchase of a site and the erection of a small-pox hospital. Five acres of land at Lund-lane, Monk Bretton, have been bought from Colonel Wombwell's trustees for £1,000; the remainder of the money is required for the building, which will contain 14 beds.

An appliance invented by Mr. W. Freer, superintendent of the Glasgow Corporation Public Halls, for the automatic locking of doors of public halls and theatres, was shown at the City Hall, Glasgow, on Friday, to a number of people interested. The invention can be fitted on to any door, and while it prevents entrance from the outside, it opens with a slight pressure from the inside.

By the will of the late Rev. Charles Sale, rector of Holt, Worcestershire, his collection of water-colour drawings of the English school, one of the finest of the kind in the kingdom, is bequeathed to the British Museum, subject to Mrs. Sale's life interest. The will also empowers the executors to offer any portion of the collection not required for the national institution to the corporation of the city of Worcester. The Sale collection is particularly rich in examples of David Cox, Samuel Prout, and Cattermole, while it also contains two or three valuable Turners and several De Wints.

Mr. Walter A. Ducat, on behalf of the Local Government Board, held an inquiry at Llandudno Junction, on Friday, touching an application by this authority for powers to negotiate a loan of £750 for the constitution of an outfall sewer at Llangystennyn. Evidence was given by Mr. T. B. Farrington, C.E., the engineer in charge of the scheme.

Mr. Shires Will, Q.C., the umpire in the recent arbitration to fix the price to be paid by the Cowes Urban District Council for the compulsory acquisition of the undertaking of the Cowes Gas Company has just issued his award, the amount being £52,150. The profits of the company for the year 1896 were £1,951. The price claimed by the company was £62,000, while the value as calculated by the council's representatives was only £32,000.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

EDINBURGH ARCHITECTURAL ASSOCIATION.—A meeting of this association was held on Wednesday in last week in the Royal Institution, Princes-street, Mr. Thomas Ross, the president, in the chair, at which Mr. Leslie Ower, president of the Dundee Institute of Architecture, read a paper on "The Evolution of Style in Architecture." The thought had been expressed by many, Why was there no new style of architecture invented? And they lamented the inartistic spirit of our time, which seemed to them to fall behind past ages in this respect. These people forgot that no architectural style had ever been invented, but had been the slow growth of centuries, and a little reflection would show that it was not to be expected even in an age like ours, unsurpassed for progress in science and invention, that either new materials or inventions would quickly work such a radical change in building design and construction, as to create anything that could be called by the honoured name of a style. The world moved slowly in such matters, and it might even be that, all unknown to ourselves, as it had always been to those who were the busy agents in producing it, a style might be developing under our hands and eyes which, in the estimation of following generations, would be fit to take rank alongside the great architectural styles of the world. The lecture was illustrated by lantern views of ancient and modern buildings.

GLASGOW CATHEDRAL LOWER CHURCH.—Mr. T. L. Watson, F.R.I.B.A., read a paper on Friday evening to the members of the Glasgow Archæological Society, in their rooms, 207, Bath-street, on "Glasgow Cathedral: the Vaulting of the Lower Church." Mr. Watson submitted that the design of the lower vaulting of the cathedral was not of one period; but of several, and in particular he contended that the middle compartment was later than the aisles. There was evidence that this part was delayed in order to facilitate the operations of building the cathedral; and that when it came to be carried out, as the cathedral approached completion, the original design was abandoned, and a modified or new plan adopted. The evidence of these facts was to be found in the mouldings, which indicated a considerable advance in the style of architecture. It was also to be found in the general design of the vaulting, which was decidedly later than the aisles; and the last evidence of it was in the springer stones of the vaulting, where it could be distinctly seen that the old plan was abandoned and a new design engrafted on the old pillars. He assigned the different portions and the periods of their construction as follows:—South-west compartment, 1190 to 1220: lower aisles, 1230 to 1240; upper aisles, 1240 to 1250; middle compartment, 1250 to 1260; and the vaulting over the stairs and the east end, 1260 to 1300.

Mr. Bakewell, architect, has formally stated to the Leeds Corporate Property Committee that the City-square will be thrown open early in February. The statues, however, are not expected to be in their position for a couple of years.

An inquiry was held on Friday by Mr. W. O. E. Meade King, Local Government Board inspector, at the Public Offices, Old Hill, with respect to an application made by the Rowley Urban District Council for sanction to a loan of £15,000 for the purpose of connecting the 6,211 houses in the district with the sewers. There was also present Messrs. E. B. Martin and W. Fiddian, joint engineers to the Upper Stour Valley Main Drainage Board; W. H. Brettell, surveyor to the urban district council; and J. Whitworth, assistant engineer.

A stained-glass window, replacing the remaining plain-glass window in the Trafford aisle of Byfield parish church, has just been put in. The window is the gift of the Farebrother family, and consists of three lights. The left-hand light contains the figure of the Apostle St. Thomas; the centre light represents St. Ann, attended by the Virgin Mary; the right-hand light is a figure of St. George and the Dragon; while the small figure filling the top portion of the window is emblematic of the Lord in Glory. The work has been executed by Mr. C. E. Kempe.

The Wellingborough Urban District Council having applied to the Local Government Board for sanction to a further loan of £3,000 for works of sewage disposal, Colonel Durnford, R.E., one of the inspectors of the Local Government Board, attended at the old board-room on Friday morning to hold a public inquiry.

NATIONAL SILVER MEDAL DRAWINGS FOR BOOK
ILLUSTRATION.

THESE spirited designs from "Jack the Giant Killer," by Mr. Sunderland Rollinson, obtained a national Silver Medal in the Science and Art Department students' competitions this year. The drawings are thoroughly decorative in their treatment, and display a freshness of idea in the handling of a well-worn history, to which a distinct addition is made by their introduction as illustrations of the story. The third picture, designed as a frontispiece to "Reaping," by George Thorne, is here reproduced to complete the proportions of our plate. The design is by the same hand, and the subject is certainly very prettily managed, with breadth, as well as a charming sense of the harvest-field, the scene being conventionally suggested.

ROSEBERRY STREET SCHOOLS, LOUGHBOROUGH.

THIS building has just been completed for the Loughborough School Board, and designed upon the central hall system, with accommodation for 66 children, to which is shortly to be added an infants' department for a further 350 children. The building is heated throughout with hot water by Messrs. Messenger and Co., of Loughborough. The walls are tiled to the height of 4ft., except central hall, which has a pitch-pine dado, and the floors are in wood block. The total cost of the scheme, when completed, and including land, will be £10,000. Mr. George H. Barrowcliff, of Loughborough, is the architect, and the builder is Mr. W. F. Harding, of the same town.

"THE CEDARS," FARNHAM.

ADVANTAGE was taken by the architect of this house, Mr. Alfred Burr, F.R.I.B.A., to adapt his design to the sloping character of the site, and a feature is made of the external stairway leading from the drawing-room and library into the garden. The kitchen and offices are located on the other side of the building. The plan accompanying the view herewith illustrated shows the arrangement of the house on the principal floor.

STABLES AND KENNELS, "WOODLANDS," NEAR
LEATHERHEAD.

THESE buildings have just been completed on Mr. Martin D. Rucker's estate. The elevations are of red brick and tile. The interior of the stables is finished with pitch-pine open roofs, with lead light windows; there is accommodation for 33 horses, one wing being used for steeple-chasers and the other for hunters. The kennels contain accommodation for about 60 couples of hounds. The whole is lighted by electricity, and

large underground tanks are provided for collecting rain-water, which is forced by pumps to convenient positions. The necessary rooms are provided for the men engaged. Messrs. Colls and Sons, of London and Dorking, are the contractors, and the whole of the stable fittings were supplied by the St. Pancras Ironwork Co. The designs were prepared and the works carried out under the supervision of Mr. E. Keynes Purchase, architect, 11, Queen Victoria-street, E.C.

HOUSE AT COLWYN BAY, N. WALES.

THIS seaside home is situated on the West Promenade at Colwyn Bay, on a site which commands extensive views of marine and woodland scenery. The proprietor is Mr. R. Stanley. The outside walls are built of buff brick with red brick and terracotta string-courses. The main feature of the interior is a large staircase hall with gallery and balustrade on the first floor, lighted by means of a top light glazed with stained and decorated glass. The architects are Messrs. Booth, Chadwick, and Porter, of Manchester and Colwyn Bay.

RESIDENCE AT SURBITON.

THIS detached residence has been built upon a large plot of ground situate in the Lovelace-gardens. It is faced generally with red bricks, with St. Aldhelm's Bath stone dressings and cement rough-cast in parts. All windows except to offices are casements opening outwards, and chiefly glazed with clear lead glazing with wide lead bars. The roof is covered throughout with "Sovereign" tiles. Internally the house contains, on the top floor, two half-attics 14ft. by 11ft. and 18ft. 6in. by 13ft. respectively, boxes and cistern space, and laundry. On the first floor, bedroom No. 1, 17ft. 9in. by 14ft. 6in., with dressing-room therefrom 9ft. 6in. by 7ft.; bedroom No. 2, 14ft. by 12ft. 6in.; bedroom No. 3, 13ft. 6ft. by 12ft.; boudoir, 15ft. 6in. by 9ft.; bathroom and lavatory (hot and cold), w.c., and linen cupboard. On the ground floor, dining-room, 17ft. by 14ft., with serving hatch; drawing-room, 17ft. by 13ft. 6in., with two bays and ingle-nook fireplace in addition; morning-room, 14ft. by 13ft. 6in.; inner hall, 13ft. 3in. by 10ft.; outer hall, 14ft. by 5ft. 6in.; kitchen and offices, with cellar in basement. The contractor is Mr. George Burrage, of Sutton, Surrey. The cost of the house, without decorations, was £1,192. The architect is Mr. R. Lano Pearce, M.S.A., &c., of Queen Victoria-street, E.C., and Surbiton, Surrey.

UNITED METHODIST FREE CHURCH, CARDIFF.

THE church and buildings herewith illustrated are being erected at the junction of Newport-road and Pearcefield-place, Roath, for the United Methodist Free Church. The church is approached from an entrance in the centre, fronting to Newport-road, and also from a tower entrance to Pearcefield-place. The porch and inner lobbies will be paved with Ruabon red tiles. The church is so planned that from the nave and transepts all the worshippers will have a good view of preacher, the floor of the nave being laid at an incline from the front entrance to the pulpit. The choir is arranged in an apsed end, which has an organ chamber on one side and choir vestry opening out from the other. The minister's vestry is also placed with convenient access to the church and rostrum. The schoolrooms, while being a distinct block of buildings with classrooms, infants' room, lavatories, &c., are connected by a wide corridor to the front porch of church, and by another corridor to one transept. The lecture-room or schoolroom is 50ft. by 30ft., with a gallery over front end, and is lighted by clerestory windows over the flat roofs of classrooms. Between the lecture-room and church, a church parlour on ladies' room, with separate lavatory and a kitchen, are also provided. The arrangement of the school-room has been such that either the assembly room, the infants' room, or church parlour can be used independently, or in conjunction with each other. The windows are fitted with plain geometrical lead-lights, which are being supplied by Messrs. Swaine Bourne and Sons, of Birmingham, who are also executing three stained-glass memorial windows, which are to be fixed in the apse at back of choir. The entire block of buildings is being warmed on the low-pressure system, from a boiler placed in vault, in a central position. The buildings are lighted throughout by electricity, the church and schoolroom being fitted with pendants from the ends of the hammer-beams to principals, and the class-rooms, vestries, &c., having brackets in suitable places. The

buildings are carried out in a free treatment of Gothic architecture, the external work all being faced with hammer-dressed blue Pontypridd stone, with Bath freestone dressings. The stone carving work has been executed by Mr. W. Clarke, of Llandaff. The contractors, Messrs. W. Thomas and Co., of Cardiff, are erecting the buildings from designs by, and under the superintendence of, Messrs. Ingall and Sons, architects, 3, Temple-row West, Birmingham.

THE CLOISTERS, LINCOLN.

THIS drawing was made by Mr. Chas. H. Holden. The north wall of the cloisters, having been built without foundations (at least, so the story goes), fell in consequence, and Sir Christopher Wren was commissioned to rebuild the same. This he did, fortunately in his happiest style, without endeavouring in the least to Gothiciise the design. The new building took the form of a Doric colonnade, with a library over. The comparison, as seen through the tracery window, is decidedly interesting, and it was this that suggested the sketch.

THE GRAND HOTEL, SHERINGHAM, NORFOLK.

FOR the purpose of accommodating the ever-increasing number of visitors to this popular seaside resort, the erection of this hotel is now being rapidly proceeded with, and is intended to be fully completed by the opening of the ensuing season. It consists of basement and five upper floors. The elevations are in red brick, with Bath stone and white brick dressings. Slates will be used for the roofs, and the turrets covered with copper. A sheltered garden, with verandahs and terraces, is also provided for use during the winter months and inclement weather. The building will be lighted throughout by electricity. The estimated cost of the work is about £30,000. Mr. Herbert J. Green, of Norwich and King's Lynn, is the architect, the contractors being Messrs. J. Youngs and Son, of Norwich.

CHIPS.

Plans of new buildings to the value of £14,000 were sanctioned by the plans committee of the town council of Aberdeen on Friday.

Colonel A. G. Darnford, R.E., one of the inspectors of the Local Government Board, sat at the Council House, Birmingham, on Friday, for the purpose of inquiring into several applications made by the city council for loans to carry out works of public improvement. There were five loans applied for, making in the aggregate £63,105. The town clerk (Mr. E. O. Smith) presented the case for the corporation.

At a vestry meeting held at St. George's, Red-ditch, on Saturday, it was decided to enlarge the church by adding an aisle, at an estimated cost of £500. Mr. Herbert R. Lloyd, of Birmingham, was appointed architect.

On Wednesday week a new mission church at Marland, near Rochdale, was formally dedicated. The new church is situated a short distance from the main road. It is cruciform in shape, of brick on a stone base, and it has a short lantern tower. The nave has an open-timbered roof. Seating accommodation is provided for about 120 worshippers. About £500 has been expended on the new building itself. Mr. Edgar Wood, of Manchester, was the architect. The contracts for the building work were divided amongst local tradesmen.

The Torquay Town Council have decided to purchase the whole of the 2,000 acres of land on Dartmoor from which it draws its water supply. All the habitations are to be removed, and the land restricted to pasturage. The cost is estimated at £40,000.

At Monday's meeting of the Croydon Town Council the sanitary committee recommended the extension of the borough isolation hospital at a cost of £12,000. A memorial was received from the Surrey Archaeological Society protesting against the demolition of the Whitgift Hospital in North-end, Croydon, a splendid example of Elizabethan domestic architecture, for local improvements.

Wrottesley Hall, the seat of the Wrottesley family for the past two centuries, has been entirely destroyed by fire. The entire mansion was burned out. Its valuable contents of furniture, family heirlooms, pictures, and an extensive library of choice books were almost wholly destroyed. All that now remains of the noble mansion built in 1698 by Walter Wrottesley, are the blackened ruins of the outer walls. The most irreparable loss is that of the family title-deeds and other documents, which practically embraced the history of the district from the twelfth century. These were stored in the muniment room adjoining the library.

Elevation facing the Garden

Elevation facing St. Peter's Boulevard.

Engineering Notes.

PROPOSED IMPROVEMENTS OF THE METROPOLITAN RAILWAY.—The Metropolitan Railway Company have duly deposited their Bill for next session in the Private Bill Office of the House of Commons. The Bill is divided into six parts. By Part 2 the company seek powers to alter the levels of their existing railway for a distance of over $1\frac{1}{2}$ miles between Kingsbury - Neasden Station and Kilburn-Brondesbury Station, and also to acquire additional lands adjoining their stations at Northwood, Willesden-green, Wendon, Quanton-road, and Chorley-wood. Under Part 3 powers are sought to acquire properties in Marylebone-road, Finchley-road, and Easton-road for the purpose of maintaining openings for the ventilation of their railway. By Part 4 power is taken by the company to work by electricity the whole of the traffic on their railway or on any part of their system, including the lines owned jointly by them and the Metropolitan District Railway Company. For this purpose it is sought to erect a generating-station on land adjoining their Edgware-road Station, and power is also sought to enter into agreements with the Metropolitan District Railway Company with reference to the working of both systems by electrical power. Under Parts 5 and 6 of the Bill additional powers are proposed to be conferred on their Surplus Lands Committee for dealing with lands between Pinner Station and Verney Junction Station and between Chalfont-road and Chesham Stations. Power is also sought by the Metropolitan and District Joint Committee to accept a lease from the South-Eastern Railway Company of all the lands above the Joint Committee's Cannon-street Station.

In the case of John Gleves, Wolfington-road, West Norwood, builder, the order of discharge from bankruptcy has been suspended for three years, ending Nov. 11, 1900.

During last week the tone of the estate market for both East and West End properties was good, and in some instances prices were realised which were beyond the expectation of many experts who frequent the Mart. The sales were chiefly of brick and mortar investments, and these, together with the Mitre Hotel, Hampton Court, which sold for £20,050, and a few reversions and life policies, brought the total for the week to £116,137, as compared with £80,453 for the corresponding week in last year. At Leeds, a freehold site containing 817 square yards, with an hotel and several other premises upon it, was sold at auction for £30,000.

The foundation-stone laying ceremony connected with the new Masonic Hall which is to be constructed by the Blagdon Lodge of Freemasons in Beaconsfield-street, Blyth, Northumberland, took place on Friday. The exterior of the building will be of special pressed bricks, with terracotta ornamentation. The news-room, smoke-room, club-room, and caretakers' apartments will occupy the space on the basement, and a large lodge-room, with ante-rooms and offices will be located on the first floor. The total cost is estimated at £1,100, and it is being built by Messrs. Goulding and Sons, of Blyth, from plans prepared by Mr. J. Goulding, jun.

The sewage works for Heywood were formally opened on Saturday. The cost of the works, exclusive of the land and the culverting of a brook to provide a tip for the health committee, has been, up to date, £34,182 17s. 10. Mr. James Diggle, C.E., of Bury, Lancs, is the engineer, and the contractors were Messrs. Townsend, Watson, and Yates, of Sheffield. The corporation purchased two farms in 1882, and secured $15\frac{1}{2}$ statute acres for £3,020. In addition to the sewage works, it has been found possible to secure a site for an isolation hospital.

The parish church of St. Mary, Scawton, was reopened on Wednesday-week by the Archbishop of York, after having been restored at an outlay of over £600. Until now it has been the oldest un-restored church in Yorkshire. At the time the present work was undertaken it was unfit for worship, with its decayed roof, its cracked walls, and tottering porch; while its wooden bell-cot, which rose a yard above the roof, had some time ago become so unsafe that it had to be removed. The porch has been rebuilt, also part of the west end, and the original window restored. The outer walls have been repaired where required, and the whole repointed. The roofs have been renewed, the heavy stone slates replaced by red tiles, the chancel roof brought to its original pitch, a new bell-cot provided, all dressed stonework stripped of its plaster and whitewash, and the floors replaced with cement concrete.

COMPETITIONS.

CARDIFF MUNICIPAL BUILDINGS.—Mr. W. Harpur, the borough engineer of Cardiff, writes us that Mr. Huon A. Matear, of Liverpool, is the author of design No. 23, and not Messrs. Hurrell and Taylor, of Manchester, as stated in our issue of last week, p. 859. The names of the authors of design No. 30, in the same list, should have been given as Messrs. William A. Pite and R. Shekelson Balfour, of 3, Upper Montague-street, Russell-square, W.C.

SHEFFIELD.—The report of the assessor, Mr. E. M. Gibbs, F.R.I.B.A., of Sheffield, on the designs submitted by local architects in the twofold competition for the proposed George Wolfenden Almshouses at Brocco Bank, and the George Wolfenden Convalescent Home at Whiteley Wood, is of an unprecedented character, for in each competition all the designs submitted had to be excluded, on account of breaches of the printed conditions which it had been stipulated were imperative. Under the circumstances it was agreed to divide the premiums equally, and to pay an equal proportion to each competitor, and the sealed envelopes remaining unopened, to place the sets of drawings in order of merit, with the result that they were eventually placed as follows:—For the almshouses: first, Mr. W. R. Bryden, architect, Buxton; second, Messrs. Hemsoll and Paterson, architects, Sheffield; third, Messrs. W. H. Lancashire and Son, architects, Sheffield; fourth, Messrs. George Sampson and Son, architects, Sheffield; and fifth, Mr. Frank Wilson, architect, Sheffield. For the convalescent home: first, Messrs. Hemsoll and Paterson; second, Mr. H. W. Lockwood, architect, Sheffield; third, Messrs. Holmes and Watson, architects, Sheffield; fourth, Mr. W. R. Bryden, Buxton; and fifth, Messrs. George Sampson and Son, Sheffield.

CHIPS.

The death is announced of Mr. William Wood, gas engineer to the corporation of Bradford, West Riding.

The London County Council decided at their last meeting to employ Mr. Fitzmaurice at a salary of £800 a year in connection with the construction of the Greenwich tunnel.

The Works Committee of West Hartlepool Town Council have decided to recommend that the engineer at once proceed with a portion of the new drainage scheme to cost about £20,000.

The litigation between the Bowness District Council and the Furness Railway Company in reference to the proposed extension of the company's pier in Lake Windermere came before the Court of Appeal last week. In the hearing at the Westmoreland Assizes, the jury had made certain findings which the judge considered amount to a verdict for the local authority. There was no finding, however, as to whether the extension would be an obstruction, and the Court of Appeal, holding that this point should have been settled, now ordered a new trial.

Mr. Alfred Bevan has made up the collection at the Masonic Commemoration Service at St. Paul's Cathedral for the Freemasons' section of Sir William Richmond's Decoration to £1,100, so as to leave £1,000 or more clear for the mosaics.

At the meeting of the Edinburgh Architectural Society held on Wednesday in last week, Mr. A. R. Scott, ex-president, in the chair, Mr. T. Kershaw Bonnar read a paper entitled "Mosaics," in which he first treated of the art from a historical point of view, tracing it from its earliest times in Egypt down to the present day, and then described the several methods, ancient and modern, of carrying out the work.

The Duke of Norfolk will open early in the New Year the Victoria Institute at Arundel, the permanent local memorial of the Queen's Diamond Jubilee.

A guarantee fund of £500 having been now promised, it is intended by the Shropshire Archaeological and Natural History Society to hold an exhibition of Shropshire antiquities in the month of May next year, opening on Tuesday, May 10, and closing about Friday, May 20. It is proposed to arrange for the delivery during the exhibition of a series of popular lectures on subjects connected with archaeology by experts in different branches of the subject.

Mr. A. Winstanley, deputy engineer of the Newcastle-under-Lyme Corporation Gasworks, has received the appointment of manager of the Rotherham Corporation Gasworks at a commencing salary of £200, rising to £300 per annum.

WATER SUPPLY AND SANITARY MATTERS.

LOANHEAD, N.B.—The new sewage purification works of the burgh of Loanhead were opened on Thursday in last week. The company met at the Haverall Wood, where the sewage from the southern section of the burgh is to be conveyed to the precipitation tanks which have there been erected. Mr. A. W. Belfrage, C.E., Edinburgh, gave an explanation of the undertaking, of which he is the engineer. He stated that formerly the drainage from Loanhead flowed into the May and Wadding burns, but objections were raised, and proceedings threatened by riparian proprietors. The international system of purification by precipitation and filtration had now been carried out. Owing to the situation of Loanhead, it was necessary to have two different outlets, and this necessitated duplicate systems, each complete in itself. New pipe sewers have been laid throughout the whole of the burgh, the old sewers being retained for road and surface water, which is not taken into the new system, but is discharged into the burns, as formerly. The sewage from the southern and larger section of the burgh is conveyed to the precipitation tanks, &c., constructed in Haverall Wood. The effluent from the precipitation tanks flows in an open channel on to four polarite filter beds, and, passing through the filtering material, is discharged into the stream purified. The works have been carried out at a cost of about £4,000. Messrs. Macdonald were the contractors.

HINTS ON WATER SUPPLY.—The Local Government Board has issued to town councils, urban district councils, and rural district councils, a circular letter directing attention to the subject of water supply. Outbreaks of typhoid at Maidstone, Lynn, and Clifton have obviously led to the issue of the communication, for the Board point out that the council are the body responsible for securing to the inhabitants of their district a proper and sufficient supply of water, and the council are specially asked to take the matter into serious consideration, "with the object of guarding their district against dangers, the gravity of which has been sufficiently shown by recent examples." Not only are the council under a responsibility for the wholesomeness of the water which they themselves supply, but they are reminded that they should, by careful inquiry, make themselves acquainted with the sources, nature, and quality of the various supplies in all parts of their district, and in every case in which the result of their inquiries is unsatisfactory should take such steps as may be within their powers with the view of supplementing or improving the supplies. The board observe generally that accurate information should be procured, if not already available, in such matters as the following:—(1) Where water is derived from gathering grounds or from springs, whether drainage from human habitations, from yards, and the like, finds its way directly or indirectly into the reservoir, or to any part of the water service; and whether risk of access to the water of excreta and similar refuse is likely to arise; (2) where water is derived from deep wells, whether surface or other water, liable to be contaminated by drains, sewers, cesspools, and the like, reaches or is liable to reach the wells.

The plans for the proposed clock-tower on the Eastgate at Chester, in ornamental ironwork, by Mr. Douglas, architect of that city, have been approved by the Duke of Westminster.

The new meat market in Bradford-street, Birmingham, erected from designs by Messrs. Essex, Nicol, and Goodman, of that city, will be formally opened for business purposes on Monday next.

On Tuesday week the Bishop of Shrewsbury (the Right Rev. Sir Lovelace Stamer) formally dedicated the new stained-glass window which has been placed by public subscription in Ellesmere Parish Church to perpetuate the memory of the late Rev. J. Peake, for 47 years curate and vicar of the parish. The window has three lights, and portrays scenes in the life of St. Paul. A representation of the Apostle is placed in the centre, while on the left-hand side his conversion is depicted; on the right-hand is a delineation of St. Paul's trial before Felix. Messrs. A. O. Hemming and Co., of London, were the artists.

In the original plans by Mr. W. Hamilton Beattie, of Edinburgh, of the new building in course of erection at the corner of North Bridge-street and Princes-street in that city, it was intended that offices for the North British Railway administrative staff should be provided in the part next the Bridge. At a meeting of the directors, held on Thursday in last week, it was resolved that the whole building should be devoted to hotel purposes. We illustrated Mr. Hamilton Beattie's design for the hotel, selected in competition, in our issues of May 3 and 31, 1895. The Directors of the North British Railway Company have purchased the Waterloo Hotel, in Waterloo-place, which will be converted into offices for their administrative staff.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 382, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 3fr. 90c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLII., XLIII., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., LI., LII., LIII., LIV., LV., LVI., LVII., LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

J. W. BROUGHTON. (Duplicates of letters sent to other journals are not desired.)

Correspondence.

WALTHAMSTOW BATHS COMPETITION.

To the Editor of the BUILDING NEWS.

SIR,—Let me inform Messrs. Spalding and Cross that the account referred to by them which I gave of their introduction as "unfortunately inaccurate," was merely an abridgement of the following dialogue which took place at a meeting of the council:—

Mr. French: He said he wrote to Spalding and Cross. The Chairman: He said he received a letter from them. Mr. McSheedy now said he had no letter from them, but Mr. Spalding called upon him, and wanted to show him some plans. He advised him to see the council, and subsequently told the committee he was outside, and that if they desired to see plans they could invite him in. Mr. French: That was better still. Instead of writing, he had an interview with one of the firm who came down a total stranger.

Mr. French said if he had had Mr. Dunford at his house with plans to discuss them and had brought him to the committee to explain them, insinuations would quickly have been made. He did not suggest anything of the kind; but if the same thing had happened in his case someone would be saying he was making something out of it.

Mr. McSheedy: I can't prevent a man calling and asking for me, and I don't know what he wants until I hear what he says.—*Walthamstow Guardian* report, Nov. 19.

I can quite understand Messrs. Spalding and Cross disclaiming the accuracy of this amazing story; but why is it unnecessary for these gentlemen to favour your readers with the truth?

I note that the statement made in reference to Mr. Rowland Plumbe is denied. Messrs. Spalding and Cross say they have never mentioned Mr. Plumbe's name in connection with a "cocked

hat," nor have they ever competed against Mr. Plumbe.

My remark was based on the report of a speech made by the gentleman who received a political telegram from Mr. Spalding (not denied), and who says Mr. Spalding called at his house with plans. This is the passage:—

"With reference to the submittance of the rival plans to Mr. Plumbe, he said Messrs. Spalding and Cross had been in competition with him and had knocked him into a cocked hat, and then he was appointed to arbitrate upon plans drawn by these gentlemen and Mr. Dunford. They had been successful competitors against him, and he knew their plans.—*Walthamstow Guardian* report, Nov. 19.

Messrs. Spalding and Cross must settle the matter with their special pleader, whose veracity they have already called into question.

Messrs. Spalding and Cross say that Mr. Dunford's name was not mentioned to them in connection with the competition, and "we were therefore surprised to find, subsequently, that Mr. Dunford had submitted a design," and, they might have added, "and won the competition."

The official minutes of the Council state "that Mr. R. Plumbe (he did not compete), Messrs. Spalding and Cross, and Mr. J. W. Dunford be invited to send in plans for public baths."

The conclusion to be drawn is clear. If an architect has not hitherto established a reputation for the erection of public baths, chiefly through lack of age (this will soon be remedied), time, and opportunity, he ought not to be allowed, no matter how much private study he may have given to the subject, to compete with men who have erected several such structures. Mr. Spalding should be invited to develop this dictum before the Architectural Association. I shall thank Mr. Spalding to keep out of my office in future when in search of information bearing upon subjects in which he has before now recognised in me an expert.

I have been informed on two occasions through your columns by Messrs. Spalding and Cross that "Mr. Plumbe considered our design superior to his own." I have never denied the fact. Referring to my design under motto "Hygiene," Mr. Plumbe said:—*This building is distinctly well designed and thought out, the whole seems to have been designed with a desire to carry it out for the estimated amount, and in this respect it must be more economically planned than the other design.* Although I think there will be the greatest difficulty in carrying out this building for the estimated amount; yet there is much more likelihood of its being carried out than the other; in fact, as I have roughly measured the building, there are nearly 130,000ft. cube less of building than in the other design." After a comparison of the two designs, Mr. Plumbe proceeds:—"I consider both the internal and external design of 'Experience' better than design 'Hygiene,' and, generally, I consider 'Experience' the better of the two. On the other hand, 'Hygiene' is in many respects an admirable design, and no doubt it is by far the more economical of the two. If, as I understand it, I am to give the greatest weight to this consideration, I should place 'Hygiene' first, although even in the case of that design, I do not think it can be built for the money." (£7,000, I stated in my report, subject to 10 per cent.) Mr. Plumbe said it could be done for £8,000, after allowing for a sudden increase in the price of materials. When you consider that Messrs. Spalding and Cross require 130,000ft. cube more building to provide practically the same accommodation (seven slipper-baths extra, but no fitted laundry), which means an extra expenditure of about £3,000, I can only say that if the superiority is not in existence, then it ought to be.

I note that these gentlemen studiously refrain from discussing the cost. Well, perhaps they are wise. It certainly would be rather difficult to justify their estimate of £7,000.

In conclusion, permit me to say that after Mr. Plumbe's report was received, the plans were under consideration four months, and then I was appointed architect. An election shortly afterwards took place, the personnel of the council was slightly changed, and eight months after, without the slightest intimation being given me that the new council would not go on with my scheme, beyond a statement that they thought the site was too cramped for baths, my appointment was rescinded, and Messrs. Spalding and Cross appointed, with power to spend an extra £1,500 on a "site too cramped for baths."

To properly appreciate the situation, your

readers must understand that the gentleman who introduced Mr. Spalding, as detailed above, is now the leader of the dominant majority of one vote.—I am, &c., J. WILLIAMS DUNFORD.

100c, Queen Victoria-street, E.C.

P.S.—I think it only fair to the section of the council that instituted the competition, instructed Mr. Plumbe to report, and appointed me their architect, to say that they have never failed to give me their undivided support.

A PARALLEL TO WALTHAMSTOW.

SIR,—The assertions and insinuations contained in the letter from Mr. James Cubitt, published in your last issue, are, so far as they concern ourselves, quite untrue, as we took no part in the competition for the East Finchley Sunday-schools, and we knew nothing whatever about the matter until we were asked by the committee to prepare working drawings and to obtain tenders from builders in open competition for the erection of the new school buildings.

Before we undertook the work we were distinctly told that it was *definitely* decided, for reasons it is unnecessary to state, not to intrust the work to Mr. Cubitt, whose charges for professional services had been settled.

Under the circumstances it does not appear to us that we should have advanced Mr. Cubitt's interests in any way had we refused the work.

The statement that we were introduced by a firm of builders who "happened to hear that the committee wanted a low tender" is ludicrous in the extreme, inasmuch as, in the first instance, the work was publicly tendered for by eleven builders, the lowest tender, amounting to £3,852, being ultimately rejected by the committee, on the ground that the amount was more than they were justified in expending on the building.

Eventually the committee intrusted the work to Mr. Wallis, a builder who was personally quite unknown to us, whose contract amounted to £3,688.

After Mr. Cubitt has satisfied himself of the truth of these statements, we shall expect him either to give us the name of his informant, or to send us an ample apology for his disgraceful insinuations.

Our plans, unfortunately, are not at present in our possession, so we could not, even if we were so inclined, discuss the question as to their authorship; but with regard to the School Hall and Gallery, we may say that they are almost identical in their arrangement and design with those we had previously carried out at Poplar, Cricklewood, and High Barnet.

However, until Mr. Cubitt has put forward a truthful statement of the general facts of the case so far as they concern ourselves, we shall treat his last insinuation with the contempt it deserves, as emanating from one who does not hesitate to publish untrue statements in his attempt to injure other architects.—We are, &c.,

SPALDING AND CROSS.

15, Queen-street, Cheapside, E.C.

Dec. 21, 1897.

TIMBER.

SIR,—I have endeavoured to answer some of the questions in Mr. D. Forbes Smith's letter in your issue of the 10th inst. as to the names fir, pine, deal, each further distinguished by the colours red and yellow, all applying to the wood of *Pinus sylvestris* or Scotch fir, which wood we do not, by the bye, get from Scotland, although it grows there in some quantity of inferior quality. Although I have tried to reply, the subject does not lend itself to explanation sufficiently succinct for your pages. Although the colour of the wood is yellow, of a somewhat reddish tinge, may not the term red have originated with the forester and timber exporter, who would so name it from its red bark? Some workers of the wood in England might follow this name, whilst others would naturally call it by the colour of the wood, not by the colour of the tree, which they never see.

Mr. D. Forbes Smith will find a wealth of information in the following books, viz., "Timber and Timber Trees," by Laslett, 1875 (late Government surveyor of timber at Woolwich Dockyard), not quite up to date; "Trees of Commerce," by W. Stevenson (Rider and Sons, 1888); "Wood," by the same author (Batsford, 1894), the last two are by a timber merchant, a

* The black spruce of N. America (*Abies nigra*) is a tree with a black bark.

frequent and interesting contributor to your columns. The last, "Wood," is particularly full of information on the points touched upon by your correspondent. The nomenclature of timber and wood is, however, in a state of confusion quite hopeless.—I am, &c., A. H.

Intercommunication.

QUESTIONS.

[11873].—**Safe Load on Solid Column.**—As there is a little mistake in this question, allow me to repeat it in another form. The load on a solid cast-iron column 12ft. high will be $\frac{1}{2}$ tons. What ought its diameter to be to prevent any tendency to yield by bending?—T. H.

[11874].—**Quantity of Mortar.**—Is there any way of finding how much mortar is required for each thousand of bricks? As the quality and fineness of the work is a material point, I should like to know how much mortar is necessary in fine work with small joints, and how much in coarse brickwork?—LEARNER.

[11875].—**Tracing Paper Preparation.**—I have heard that if the surface of tracing-paper is rubbed over with chalk, it will take the ink much better. Will any draughtsman inform me of his experience, and if there is not a better preparation than chalk?—G. T. S.

REPLIES.

[11852].—**Slate Roofs.**—Countess slates are 20in. by 10in., and are generally used for roofs of a quarter pitch, and the steeper the pitch, the smaller the slate, is the general rule. For half-pitch, "ladies" or "doubles," 13in. by 7in., may be used. Slates are nailed near the head or near the middle. The gauge is the distance the battens are placed from centre to centre, and it is necessary to determine the gauge before the battens are fixed. It is calculated thus:—An inch is deducted from total length of slate, as the position of nail-hole from upper edge; deduct lap, and divide by two, which gives the gauge. For a Countess slate the gauge is—

$$\frac{20 - 1 - 3}{2} = \frac{16}{2} = 8 \text{ in.}$$

For a "lady" it would be 6in. If the slate is fixed near the middle, the gauge is a little more, about $\frac{1}{2}$ in. The head nailing takes more slates, but is more secure, as there is always two thicknesses of slate over the nail-hole. A thousand Countess slates is estimated to cover $5\frac{1}{2}$ squares. The hips and ridges can be of slate. Valley tiles are made; but lead valleys are preferable.—G. G.

[11861].—**Roof Stresses: Graphics.**—The lines of action of three forces in equilibrium must either meet all at a point, or be parallel. Hence, the direction of one resistance being given, the direction of the other may be determined by drawing through its point of application to the point in which the first meets the resultant of the given forces. The triangle of the forces can then be drawn. The funicular polygon is very conveniently used for working such problems, especially when there are many forces to deal with; but a full description of the methods would be too long for insertion here.—J. C. PALMER.

[11862].—**Strength of Cast Iron.**—The sketch given shows a manifestly inadequate base for the upper column. The column ought to rest directly on the lower column, for which purpose the latter ought to be continued to take the bearing of the base-plate, and the beam ought to be made to rest on an iron bracket or projection of the lower support. As drawn the construction is not safe. Of course, the upper plate D would have to bear compressive stress if used as shown, and the weight (100 tons) would be carried on the sides of the beam-box.—G. G.

[11863].—**Strength of Cast Iron.**—On no account should the upper iron pillar be placed as shown on the beam-box or girder, by bolting the base of the upper column to the box or to the upper flange of girder. The girders carrying the floor should be carried independently of the column—that is, the whole section and column should go through, the lower column supporting directly the upper one. The ends of girder ought to rest on the cap of column or bracket cast on and secured to a core-box or continuation of the shaft of lower column by angle-irons riveted to the web and held by bolt. No vertical weight comes on the girder in this case; the core or stiling of lower column supports the whole weight. The upper column rests on a flanged cap of the core which passes through, so that the vertical support is in fact continuous; the girders simply rest on the projections or capital of lower stanchion or column.—G. H. G.

[11863].—**Waterworks.**—The most complete work on this subject is undoubtedly "The Water Supply of Cities and Towns," by W. Humber, A.M.I.C.E. (Lockwood and Son). The cost is £6 6s.; but the work gives plans and details of wells, reservoirs, tanks, pumping machinery, conduits, &c. For the engineer entrusted with any waterworks, the volume is worth its weight in gold. It is illustrated by 50 large plates and hundreds of woodcuts. Send for particulars to publishers. "Student" will find it a most exhaustive treatise on the water supply of towns. Another useful hydraulic manual is Slagg's "Water Engineering." The latter is a useful treatise of moderate price, and published by the same firm.—BIRMINGHAM.

[11863].—**Waterworks.**—Get "The Water Supply of Towns and Construction of Waterworks," by W. K. Burton, M.Inst.C.E. (Lockwood and Son).—G. H. G.

[11864].—**Textbooks.**—Mitchell's "Advanced Building Construction" and Walker's "Brickwork" are good authorities. One of the best textbooks is "Building Construction" (Longmans). With these books "Kiln" ought to be able to coach himself up for the Honours Exam. I believe Prof. H. Adams has also published a handbook.—G. H. G.

[11865].—**Sea-Walls.**—Upright walls, or with a

slight battered face, of 1in. to 2in. to the foot. A slightly hollowed profile to the sea is preferable. If of earth the front or slopes may be pitched with chalk or local stone. Kentish ragstone has been used for this purpose, as at Canvey Island, where the walls are of considerable height, with a long slope 3 to 1 to the sea. This slope is pitched. Concrete is the best material, with a good slope to the sea of $\frac{1}{2}$ or 2 to 1. Groynes are necessary to prevent the foundation being undermined in many cases.—H. S.

[11867].—**Safe Load on Solid Column.**—In reply to "T. H.," the question is vaguely put. If the load per square inch is known, the diameter of column must be known also. "T. H." no doubt wishes to know what the ratio of the length to diameter should be to be safe at the load he gives. He may take this as 25 to 1. If the column is 6in. in diameter, its length must not exceed 12ft. Referring to some tables, I find that a safe load for a solid cast iron column 20 diameters long is 2 tons per square inch, so that a column, say, 25 diameters will carry about $\frac{1}{2}$ ton per square inch. For a column longer than this, wrought iron is rather stronger than cast iron; when shorter, the greater crushing resistance of cast iron comes into play.—PRACTICAL.

CHIPS.

The parishioners of Threlkeld, near Penrith, have this week decided to undertake the restoration of their ancient church at a cost of £1,500. The offer of a stained-glass window from the mother-church of Crosthwaite cannot be accepted.

The parish council of St. Agnes, Cornwall, have adopted plans by Mr. R. H. Worth, C.E., of Plymouth, for the supply of water to the town and Mount Hawke district. The estimated outlay is £5,000.

The Royal Academy's customary winter exhibition, which will open for private view on New Year's Day, is to consist of a collection of the works of Sir John Everett Millais, the late president. It will be an unprecedentedly complete representation of the work of the greatest English painter of the century.

Taunton's Endowed School at Southampton is about to be enlarged at a cost of £2,300. Mr. Gutteridge, of Southampton, is the architect, and Messrs. Brinton and Bone, of the same town, are the builders.

A movement is on foot for the restoration of the tower and spire of the well-known "round church" of St. Sepulchre, Northampton. The architect is Mr. Matthew H. Holding, A.R.I.B.A., of Northampton, and the estimated outlay about £1,000.

Mr. Robert John Hinton (eldest son of Mr. John Hinton, one of the district councillors and the chairman of the Woolston parish council), the senior partner in the firm of Hinton Brothers, builders, Woolston, Southampton, died last week at the early age of 27 years.

Mr. Richard Park, architect, Newton-Stewart, has been instructed to prepare plans for the Jubilee Cottage Hospital to be erected at Castle Douglas at a cost of about £1,200.

A three-quarter length life-sized painting of Mr. George Lord Beaufort, an ex-Mayor of Scarborough, and the founder of the Doré Gallery in London, was last evening presented to the Scarborough Corporation by Mr. Ernest Normand on behalf of his wife, née Henrietta Rae.

Sheriff Crawford, oversman in the reference between the commissioners of the river Tweed and the Edinburgh and District Water Trustees as to whether the salmon fishings of the Tweed will be injuriously affected by the construction of the Talla reservoir and the consequent abstraction of water from the Talla, has now issued his award. He finds that the Tweed salmon fishings will be injuriously affected, and fixes the compensation at £2,250. Alternatively he assesses the damages at £300 and £550.

Nearly two years ago Mr. Goodwin, a builder, employed a firm of solicitors to obtain a loan of £21,000 upon two blocks of flats in Westminster. Before the loan was effected the builder procured the money from a building society, and the solicitors claimed to be entitled to commission, as if, in fact, the loan had been secured by them. The late Mr. Justice Cave decided against the claim for commission, but held that the solicitors had a right to be paid for services rendered, judgment being given for £245. The Court of Appeal considered, on Tuesday, that the £100 paid into court by the defendant was sufficient, and they directed the plaintiffs to pay the costs of the appeal and of the trial.

At Tuesday's meeting of the London County Council it was resolved, after debate, to intrust to the Works Department the execution of certain buildings for housing the working class on the Millbank site at an estimated cost of £14,018. On a recommendation by the Parks Committee that the Council contribute £2,500 towards the acquisition of Churchyard Bottom Wood, Highgate, for purposes of public recreation, Mr. Shaw Lefevre moved that the recommendation be referred back to the committee with instructions to consider the desirability of increasing the contribution. The amendment was carried by a large majority.

LEGAL INTELLIGENCE.

WORKING-CLASS DWELLINGS AND THE LONDON BUILDING ACT.—THE LONDON COUNTY COUNCIL v. DAVIS.—SAME v. ROWTON HOUSES (LIMITED).—In these cases, in which judgment was given by Justices Hawkins and Channell on the 9th inst., the County Council appealed against the decision of two Metropolitan Police Magistrates, one at Lambeth, and one at Worship-street, dismissing summonses taken out by that body against the two respondents, in order to compel them to set back new buildings occupying the sites of old buildings which had been erected prior to the Building Act of 1894. The proceedings were taken under this Act, which reserved the rights of the owners of houses built prior to its passing to rebuild under certain conditions houses upon the old sites, without reference to the distance from the centre of the road and the height prescribed by the Act. There was a proviso, however, to the effect that no dwelling-house to be inhabited or adapted to be inhabited by persons of the working class should, without the consent of the County Council, be erected within the prescribed distance to a height exceeding the distance of the front or nearest external wall of such building from the opposite side of the street. This was the enactment upon which the County Council relied, and they contended that the structures now in question were inhabited by and were adapted to be inhabited by persons of the working class, and as they were erected without their consent should be set back so as to comply with the general terms of the Statute. In the second case—that of the Rowton House company—it appeared that the County Council had requested the respondents to apply for their consent to the erection of buildings, which it was not denied would have been granted, as the structure faced disused churchyard, and no question of air space or overcrowding could arise; but the company declined to do so, contending that in law the Council's consent was not necessary. The facts of the first case were briefly as follows. The respondent, Mr. Davis, was the owner of a plot of land fronting Brick-lane, upon which originally ten shops and living-rooms behind stood. In the place of these ten shops, &c., and occupying precisely the same site, Mr. Davis built eleven shops, with rooms over them. In the case of one of these, however, No. 105, the space formerly used as an open yard was utilised for living-rooms, there being also rooms over the shop. It was in regard to these latter rooms that the question in this case arose. The premises were let to a Mr. Cohen, who sublet the two or three stories over the shop to people who earn their livelihood by manual labour, and were working people, and occupied the rooms at the back of the shop himself. This, it was said, brought the premises within the proviso. In the second case, the Rowton Houses (Limited), of which company Lord Rowton was chairman, had demolished thirteen old dwelling-houses, and erected on the same site a building capable of accommodating some 800 persons. The building, which was in Churchyard-row, Newington Butts, and was opposite a disused churchyard, now used as an open space, was erected for the use of single men, who were received for the night, or by the week, and had, in addition to the use of the place in which they slept, the use of recreation-rooms and facilities for obtaining food. It was described as a poor man's hotel, or club, by the respondents; but the County Council contended that it came within the proviso in regard to any dwelling-house to be inhabited, or adapted to be inhabited, by people of the working classes. For the respondents, in both cases it was submitted that the proviso referred to flats and artisans, and model dwellings, tenement houses, &c., which were being erected for the purpose of housing of the working classes, and not to buildings where it happened that, after erection, working men, as in the first case, lived, or, as in the second case, working men, mixed with clerks and other people, resided, as in an hotel or club. The Court adopted the contention of the respondents, and dismissed both appeals with costs.

A PARTY-WALL DISPUTE.—Before his Honour Judge Edge at Stonehouse County-court, on Dec. 14th, an adjourned action remitted from the High Court was heard. John Mullis, a builder, sued Thomas Jeffery Monk, builder, for £26 16s. 9d., the price of a party-wall between 49 and 50, Grenville-road North, on the Seymour Building Estate, Plymouth. Plaintiff alleged that he built the wall on his site, and the conditions of the estate under which the defendant bought his land adjoining stated that the person using a party-wall should pay the adjoining owner and builder the amount ascertained by the architect of the estate. The architect of the estate had been called upon to make the valuation; but as he had not done so, an outside architect had been called in, who assessed the party-wall at the amount sought for. It was submitted for the defence that the architect of the estate had not refused to make the valuation, and, even if he had, it did not affect the defendant, who, according to the conditions, had only to pay within one month after the architect for the estate had given his certificate; and as he had received no

such certificate and had done nothing to impede it being given, it was submitted he was not liable. Verdict for the defendant, with costs.

DAVIES-STREET STATION ARBITRATION.—THE VALUE OF A CORPORATION LEASE.—Mr. Under-sheriff Burchell and a special jury, at Red Lion-square, Holborn, on Monday, heard the case of "Major Robson v. the Central London Railway Company." It was a claim for £13,653 and 10 per cent. for compulsory sale, in respect of the premises Nos. 29 and 30, South Molton-street, and 82 and 84, Davies-street, Oxford-street, held of the Corporation of London, on lease, renewable in perpetuity, at a ground-rent of £20 8s. 6d. per annum. The property was underleased at rents amounting to £430 per annum. Alderman Sir J. Whittaker Ellis (Messrs. Farebrother, Ellis, and Co.) said he took the rental of £430 less the ground-rent, £20 8s. 6d., £409 11s. 6d., on the 4 per cent. table for the term of the underlease, giving £6,143, to which he added the present value of the reversion, £5,995, making £12,138, to which the customary 10 per cent. for compulsory sale should be added. He expressed the opinion that corporation leases were quite equal to freehold, and stated that the covenants meant no more than that the lessee should use the property in a prudent and judicious manner. Mr. Bridgewater (Messrs. Debenham, Tewson, Farmer, and Bridgewater) said his total estimate was £11,266, plus 10 per cent. Mr. Frederick Warman gave a valuation amounting to £13,368. On behalf of the railway company, Mr. Freeman, Q.C., contended that a lease, however good, could not be regarded as equal in value to a freehold. Mr. Daniel Watney stated that, as far as title was concerned, a corporation lease was indefeasible, but it was not equivalent to freehold, as the lessee could not do as he liked with the property. He was of opinion that 20 years' purchase of the existing rent, £430, less the ground-rent, represented the fair compensation. His estimate was £8,020, plus 10 per cent. for compulsory sale. Mr. Samuel Walker (Walker and Son) estimated the value of the property, until the expiration of the underleases, at £5,637, and the reversionary value of the site at £2,836, a total of £8,473, to which the customary 10 per cent. should be added for compulsory sale. Mr. Walter Rushworth gave an estimate of £8,200, plus 10 per cent. The jury awarded the claimant the sum of £11,800, including the 10 per cent. for compulsory sale.

DOES A BUILDING AGREEMENT REQUIRE REGISTRATION?—At the Liverpool Assizes, on Friday, before Mr. Justice Bruce, the case of Callow v. Galt, Edmunds, and Co. was tried. This case raised the question as to whether a building agreement between an owner of land and a builder constituted a bill of sale and required registration. William Orry Callow, the plaintiff, who was the owner of certain land, had entered into a contract with a builder to sell the land for building purposes on a building agreement which vested the materials brought on the land in the owner of the land, and gave him a right to take possession of and sell the land and materials upon default by the builder in fulfilling his part of the agreement. The plaintiff having taken possession under the agreement, the defendants, a firm of timber merchants, with the consent of a partner of the builder, went on to the land and removed certain timber and materials which they had supplied to the builder, and for which they had not been paid. The plaintiff thereupon brought this action for trespass to the land, and for conversion of the timber removed by the defendants. After considerable argument, Mr. Justice Bruce decided that the building agreement came within the decisions of "Brown v. Bateman" and "Reeves v. Barlow," and was not a bill of sale. He gave judgment for the plaintiff for £60, the agreed value of the timber removed, in addition to £1 paid into Court in satisfaction of the trespass.

CLAIM FOR COMMISSION.—In the Queen's Bench Division, last week, Mr. Justice Bigham gave judgment in the case of Walton v. Lord Churchill. The action was brought by Messrs. Walton and Lee, estate agents, London, to recover from Lord Churchill, a lord-in-waiting to Her Majesty, the sum of £1,550 commission on the sale to Mr. Du Crois of the defendant's Cornbury estate in Oxfordshire, which, it was alleged, had been bought by the action of the plaintiffs. The defendant denied liability. The estate was sold for £115,000. His Lordship reviewed the facts of the case in a written judgment. He said he had come to the conclusion that the sale of the estate could not be attributed to the action of the plaintiffs, either direct or indirect, and he gave judgment for the defendant with costs.

LIABILITY FOR REPAIRS TO DRAINS.—At North London Police-court last week, before Mr. d'Eyncourt, William Jennings, of Bayston-road, Stoke Newington, sought to recover a proportion of £31 7s. 6d. which had been paid by him for making good some drainage defects. In 1878 five houses in Bayston-road were erected, with combined drainage at the rear, the flow to the main sewer coming under Mr. Jennings's house, which was in the centre of the five. In September last there was

a stoppage in the drains, and the Hackney Vestry served a notice on Mr. Jennings to unstop, make good, and provide an inspection-chamber. Mr. Ware, a local builder, was called in and did the work, and had been paid his bill by Mr. Jennings. Two of the adjoining four tenants had paid their proportions, and the two owners now summoned were Mr. J. G. Padden and Mr. J. Astins. Complainant called the sanitary inspector to prove the cause of the complaint, and the builder to say he had done the work; and the latter, in cross-examination, said he should think the accumulation in the sewer had been going on for some years, and there were articles in the drains which might have come from any of the houses. Complainant's counsel said the 11th section of the Public Health Act gave him power to come to a court of summary jurisdiction; but Mr. Avory said the provision was only for local authorities to recoup themselves, and not for private individuals. In fact, there was a covenant in all the leases on the Tyssen-Amherst estate that, in the event of such a dispute, the surveyor to the estate should arbitrate, because one house might be liable to pay £6, and another £4, and another £3. Mr. d'Eyncourt said a good deal would depend upon whether or not these drains were laid according to plans approved by the vestry, proof of which was not now present, and head-journed his decision.

ARCHITECTS AND THEIR DIFFERENCES.—At the Cardiff County-court, on Thursday in last week, the case of William Lewis, architect, of Newport v. David Morgan, architect, of Cardiff, was heard, in which plaintiff claimed £57 8s. 9d. In 1894 the two architects were employed by the Bedwelty School Board to prepare plans for three new schools. They were to receive commission at the rate of 7½ per cent. on the cost of the buildings. Only one had been originally appointed architect to the school board; but it was afterwards arranged with the board that they should act together, and an arrangement was made between the men as to the division of the commission. Under that arrangement one was to take the plans of schools in the Tredegar Valley, and the other those of schools in the Rhymney Valley, this to prevent competition between them. One set of plans had been rejected because they were drawn up according to wrong instructions. A new set were prepared. The division of commission had been taken upon the plans accepted, but there was a sum of £150 paid in respect of the plans that were rejected, and plaintiff argued that that sum was not commission within the agreement made between the two professional men. Defendant had received the payment for the plans that he prepared; plaintiff claimed that he had not received enough from defendant in the division; and defendant urged that the £150 should have been brought into the account for division. The amount of commission on the plans accepted from defendant was £312 15s., and on the plans accepted from plaintiff was £188 8s. 11d., besides the £150. His Honour (Judge Owen) ruled that the sum in dispute did not come within the terms of the agreement made between the two men, and gave judgment for the amount claimed, with costs.

IS A WALL A BUILDING?—PARK V. RAWCLIFFE.—In this case, recently heard at Manchester by the Vice-Chancellor of the Duchy, the plaintiff, who is the owner of a building estate at Fulwood, Preston, asked for a mandatory injunction to compel the defendant to pull down a wall erected by him on a plot of land forming part of the estate, on which the defendant had built two semi-detached villas. The plaintiff fixed his building line at 15ft. from the road; but the defendant, who erected his houses in 1887, set them 62ft. back. Subsequently the plaintiff conveyed a plot of land adjoining the defendant's to a person named Livesey, who set his house up to the 15ft. building line. There was litigation in the High Court with respect to Livesey's building, an attempt being made to compel him to adopt the 62ft. building line, but the Court declined to interfere, and Livesey thereupon christened his house "The Victory." The effect of the erection of his house was to make the defendant's windows overlook Livesey's back premises, and Livesey's side windows to overlook defendant's front garden. In May of this year the defendant erected in his garden a wall 24ft. high and over 40ft. long, the effect being to shut out the sight of Livesey's house from the defendant's house, and to block several of Livesey's windows. The plaintiff, as the owner of the building estate, said he was damaged by an unsightly erection, and in behalf of his claim that it should be pulled down it was contended that the defendant had contravened a covenant in the conveyance of his land, by which he undertook to erect no buildings the plans of which had not been submitted to the plaintiff. After hearing legal arguments as to whether the wall was a building within the meaning of the covenant, the Vice-Chancellor held that, although the erection in question was undoubtedly a building, it was not a building within the scope of the covenant, which clearly contemplated certain buildings mentioned in the conveyance such as could be entered. The action was, therefore, dismissed with costs.—Mr. Mansfield said

that he was afraid Mr. Livesey's stone bearing the words "The Victory" would now have to be taken down from his house and transferred to the wall.

CHIPS.

A new Wesleyan mission chapel is about to be built in Hill-street, Bingley, from plans by Mr. R. Nunn, of that town.

The Local Government Board have given formal sanction for the borrowing, by the district council of Farsley, of the sum of £15,700 for purposes of sewerage and sewage disposal.

Mr. Sheldermine, the city surveyor of Liverpool, who is lying ill from typhoid fever at his residence, Blundellsands, has passed the crucial point, and is now progressing satisfactorily.

An inquest was held at Lichfield, on Monday, concerning the death of John Elsworth, a foreman bricklayer, of 215, Bracebridge-street, Birmingham, whose body was found shockingly mutilated on the London and North-Western Railway, on Saturday morning. The evidence showed that the deceased had folded his arms, and placed his head, face downwards, on the line, in front of a passing train. He had been somewhat troubled about losing his situation and over making up the accounts of a society to which he was secretary. The jury returned a verdict of "Suicide while in a state of temporary insanity."

The plans prepared by Mr. W. C. Williams, architect, Halifax, of the new board school to be erected at Sunnyside, Halesy Hill, have been accepted by the Halifax School Board.

The foundations of SS. Simon and Jude's Church, in the parish of North Meols, Southport, have for some time past been in such a defective condition that the fabric has sunk appreciably in different parts. In such circumstances the rector has deemed it dangerous to hold services in the edifice, and on Sunday it was closed. A meeting of the congregation has been convened to consider what steps should be taken in the matter. The church was erected only five years ago.

The death is announced of Mr. H. Fenner, of Bristol, one of the vice-presidents of the Bristol Cabinet Manufacturers' Federation. The members of that body were represented at the funeral at Brunswick Burial Ground, near that city, on Wednesday, by the President (Mr. C. Newth) and other officers.

The building trade in Dundee, which for the past few years has been attended with steady briskness, has enjoyed during the past twelve months another period of unbroken prosperity. Opening the year with abundance of work on hand, contractors have been fully employed, with the result that many large blocks of property have been added to the assessable rental of the city.

At a meeting held in the Shire Hall, Shrewsbury, on Monday, under the presidency of the Lord Bishop of Lichfield, it was resolved, on the proposition of Lord Harlech, to form a society for the purpose of preserving and publishing the parish registers of the county of Salop. It was agreed that copies of the registers as published from time to time by the society should be deposited with the original register in the parish chest, in the diocesan registry, in the British Museum, and in the library of the New England Historic Genealogical Society in Boston.

The inquest on the body of Joseph Webster, 18 years of age, of Parr, St. Helen's, who was killed, while two other young men, named Jones and Johnson, were seriously injured, by a fall of clay at the Ramford Brick and Tile Works, on the 22nd ult., was held before Mr. S. Brighouse, county coroner, at Parr, on Monday. Mr. H. Hall, her Majesty's inspector of mines, was present, as well as Mr. Peter Tickle, owner of the works, and Mr. John Gaskell, manager, was called into the room. After hearing the evidence, the jury returned a verdict of "Accidental death," arising from the negligence of the management in employing inefficient men to get clay, and they recommended that the clay should be got in 5ft. benches, instead of 10ft., and that the labour of more experienced men should be engaged in future.

The Diamond Jubilee hall in Higher Bebbington village, Cheshire, was formally opened on Monday. The accommodation provided consists of two classrooms for technical instruction, entrance hall, and the large hall, which latter contains 350 seats and stage. The walls internally are finished in red duresco, with a frieze of buff laid direct on the brick lining. The building has been carried out at a cost of about £1,400, and is so planned that a future extension may be added. The contractors' work has been carried out by Messrs. Lee and Son, of Higher Bebbington, under the direction and from the designs of Mr. Charles E. Deacon, architect.

The workhouse at Richmond, North Riding, is about to be enlarged in accordance with plans prepared by Messrs. Moscrop and Sons.

Our Office Table.

EIGHT additional portraits have recently been acquired by the trustees of the National Portrait Gallery. A large family group of Adam Walker (1731-1821), natural and experimental philosopher, with his wife, his daughter, afterwards Mrs. Gibson, and his three sons—William and Deane F. Walker, lecturers on experimental philosophy, and Adam Walker, afterwards Prebendary of Hereford; painted by his friend, George Romney. This was bequeathed by the late Miss Ellen Elizabeth Gibson, of Durham, grand-daughter of Adam Walker. Another work, presented by Major Harrel, portrays Sir George Hayter (1792-1871); a sheet of sketches by himself, representing himself in the act of painting the large picture of the House of Commons in 1833, now in the National Portrait Gallery. A third picture represents Mungo Park (1771-1806), the African traveller and explorer of the river Niger; a miniature painting after H. Edridge, A.R.A. The other works, all of which were purchased, are Thomas Gainsborough, R.A. (1727-1788); a drawing by F. Bartolozzi, R.A., taken from the original portrait of Gainsborough by himself for the purpose of engraving. Jane Porter (1776-1850) and Anna Maria Porter (1780-1832), novelists; companion drawings by G. H. Harlow, which were engraved for Jordan's "National Portrait Gallery," Vol. V. Tobias George Smollett, M.D. (1721-1771), the eminent novelist; painted at Pisa, probably by an Italian artist, and formerly in the novelist's own possession at Leghorn. General James Wolfe (1726-1759); a full-face portrait, seen to the knees, in the uniform of the Marines; painter uncertain. A full-length portrait of Henry, Prince of Wales (1594-1612), painted by Paul Van Somer, and formerly at Blenheim Palace, has been purchased from a fund presented by the committee of the Stuart Exhibition in 1890.

The trustees of the British Museum have decided to discontinue the opening of the exhibition galleries on week-day evenings from eight to 10 p.m. after the close of this year, and, instead, to keep them open until 6 p.m. all the year round. The evening opening commenced in February, 1890, on the installation of the electric light, the galleries, however, being opened only in sections, as the electric plant is not powerful enough to light up the whole building. At first the eastern and the western portions of the Museum were opened on alternate week-day evenings; but the number of visitors so rapidly declined that the galleries were afterwards further sub-divided into three sections. The numbers, however, have still continued to decline. The experiment of evening opening will now be abandoned, and a lengthened exhibition by day will be substituted, during the months when the Museum has hitherto been closed at 4 p.m. or 5 p.m., according to the season. On and after Monday, the 3rd January next, the Exhibition Galleries will be kept open throughout the year from 10 a.m. to 6 p.m., with this reservation, however, that when the electric light has to be employed, only half of the Museum (the eastern and the western galleries alternately) can be opened to the public. The present arrangements for opening on Sunday afternoons will not be altered, visitors being admitted at hours varying between two p.m. and 7 p.m., according to the season of the year.

At a meeting of the Socratic Society of Birmingham held on Friday afternoon, Mr. F. A. C. Morrison, the newly-appointed Classical lecturer at Mason College, read a paper on the application of colour to sculpture among the Greeks. The President (Professor Sonnenschein), in introducing Mr. Morrison, expressed his hope that Mason College would play its part in the new revival of classical learning which is going on all around us, and his confidence that the appointment of Mr. Morrison would reinforce the teaching of classics in Birmingham on its archaeological and artistic side. The lecturer then gave an account of the practice of colouring both buildings and statuary in all periods of Greek art, and said that the modern aversion to coloured marble was due to some extent to a misconception. In the early stage, no doubt, the Greeks used colour to conceal the deficiencies of the chisel; but in the fifth century the effect of colour was to heighten the beauty and to bring out the characteristic features of works of art. The lecture was illustrated by lantern slides,

exhibiting some of the chief works of art in which traces of colour have been found.

"THE UNITY OF THE ARTS" was the subject of a Glasgow Corporation art lecture given by Mr. Edward Pinnington on Saturday evening. Mr. Pinnington adduced the intellectual torpor of the craftsman, resulting from mechanical production, as one of the obstacles to the modern restoration of the ancient unity of the arts. Presiding over a machine dulled his invention. If the people insisted upon having household utensils which were individual works of art, and not manufactured in sets and dozens, the genius of the artificer would be stimulated, and machines instead of men be left to rust. This was simply to restore the condition of things existing in ancient Greece and at the Renaissance. Some interesting instances were given of the carrying of the skill of a craftsman into painting. The ancient supremacy in technique and manual cleverness was admitted, and the old conditions of life were not to be overlooked; but there was nothing in the former to induce despair. The painter could learn much by studying decoration as exemplified in the old objects of industrial art, and the artificer could learn much by going to the old masters for instruction in design. But both would be wrong if, instead of inspiration, they only found hints for imitation.

At the quarterly meeting on Friday of the Devonshire County Council, the Main Roads Committee re-submitted a scheme for maintaining the rural main roads after 31st March next, the consideration of which was postponed from the last meeting of the council until the present. The scheme provided for taking the rural main roads out of the hands of the rural councils and replacing them under the direct control of the county council; for the division of the county into three districts, for each of which a county surveyor, three assistant surveyors, and five foremen should be appointed, each surveyor to receive a salary of £400 a year, with £80 besides office and clerical assistance; also an allowance for necessary travelling expenses, and 10s. a night when from home; each assistant-surveyor £140 a year; each foreman 25s. per week. After a long discussion the scheme was adopted.

The annual dinner of the Cardiff Master Builders' Association was held at the Royal Hotel on Thursday evening in last week. Mr. J. E. Turner, the president, occupied the chair. "The Army, Navy, and Reserve Forces" was proposed by Mr. A. J. Howell, and responded to by Major E. M. Bruce Vaughan, F.R.I.B.A. Mr. David Davies submitted the toast of "The Architects and Engineers." Mr. Edwin Seward, F.R.I.B.A., in responding, referred to the recent architectural competition for the designs of the new municipal buildings. According to some people, the question of the successful design was already settled; but there were opinions to the contrary, and if the advisers of the corporation in the matter had not yet spoken, he believed it to be most judicious and discreet to withhold criticism until after the pronouncement had been made. The architects of Cardiff had taken a very creditable part in the competition, and he hoped their work would not be utterly thrown away. Mr. Fawcner (Messrs. Habershon and Fawcner) also replied. Mr. W. Symonds gave "The Cardiff County Council." Councillors F. J. Veall and J. W. Courts also responded. Mr. E. W. M. Corbett, in submitting "The Cardiff Master Builders' Association," said the speculative building trade of Cardiff could not have built much less than 29,000 houses at a cost of £6,000,000 or more, while they were annually adding to the town something like 1,500 houses at between £300,000 and £400,000. The president (Mr. J. E. Turner), Mr. J. Seymour Chubb, and Mr. George Couzens acknowledged the toast. "The Visitors" was proposed by Mr. John Gibson, and responded to by Mr. A. Krauss, Bristol, and Mr. T. W. David.

The new fever hospital, Llandudno, is being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Both branches of the Manx Legislature met in Tynwald on Thursday in last week, at Douglas, Lord Henniker presiding, when authority was given to the Douglas Corporation to borrow £17,600 for the new municipal buildings and public library, £5,750 for the erection of a block of artisans' dwellings, and about £7,000 to acquire property for the improvement of the North Quay.

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2243.

FRIDAY, DECEMBER 31, 1897.

PROSPECTS.

IN making a forecast of any subject—weather, rainfall, business, or the crops—it is customary to take a few averages of the previous years on which to base it; and in the same manner, if we try to make a forecast of the architectural profession, it is necessary to see what has been accomplished. We may consider the profession as influenced by the three great movements: Educational, the Commercial or Utilitarian, and the Artistic. An attempt has been made of late years to place architecture upon a better footing as a profession—to give its members a higher social status—to improve the education of those who enter the business. How far this endeavour has been rewarded remains to be seen. So far as these efforts are directed to bring about an exclusive professional clique, associated with any one professional body—a favoured “ring”—there can be little doubt of the result; success only will be attained by guarding all the approaches to the profession, so that those who enter, irrespective of being a member of this or that society, will be guaranteed to be qualified in the essentials of the profession. There is a coterie who wish the test to be applied only to those who enter their charmed circle. So one-sided a view of architects’ training will never do. Every man who enters the profession and practises must be examined, or the really able and artistic will be left outside. Already we see a reaction against what appears to be a professional monopoly. We mean the school of artist-craftsmen, who base architecture on workmanship and personal skill. What has been truly called the “scholarship theory of architecture” has failed, and in its place has grown up a belief that the art rightly practised is an association of the several building trades. Architecture is the “built word” as “literature is the written word,” so says one of the leaders of this view, and he is right. Then we live in the days of trade-unions and free trade, and these principles have begun to operate upon the profession of building. No man under this régime minds his own business. Division of labour has brought this result, that no man can be his own master. Individuality is getting more lost in this division of the trades. What has become individually impossible is now tried to be gained collectively. And it is this reaction of one trade or craft on another that is leading to confusion. The architect finds it equally with every trade; he finds that the engineer, the manufacturer, the specialist in art have each to be reckoned with, limiting his own function. Irresistible facts, scientific and otherwise, condition his design at every step. But out of present conflict harmony will be restored by-and-by.

The connection of the architectural profession with many important movements of the day is one of some concern. It has fallen to the lot of the modern architect to develop and express some of the most recent activities of the age—hygienic, sanitary, social, and ameliorative—and the vast produce of the markets of the world, the importation of cattle, live and dead stock, vegetables, and fruit and manufactures of all kinds have to be provided for. Depots and markets, abattoirs, and refrigerating requirements, far beyond our forefathers could have dreamt of, have been demanded, in which the builder’s art, if not the architect’s resources, are taxed. For these buildings, the architect has been called

upon to master numberless details. Economical construction of walls, floors, and roofs, doors and windows, with cavities for non-conducting materials in the case of cold-meat stores; overhead travellers and mechanical appliances for moving carcasses and heavy loads, refrigerating apparatus, machinery of lifts, hoists, and other things have not only to be mastered before an architect can draw a line of his plan, but he is called upon to consider these several arrangements and appliances so as to incorporate them in his design—to make them, in fact, features of the architecture. The time has gone by when these things were passing through the tentative stage, when such a thing as an iron crane was stuck outside a building anywhere; when overhead travellers were fitted up after the builder had done his work; when a market building was built like a railway station, or a factory was nothing more than a shed with openings evenly spaced, divided by pilasters. Now each kind of structure, however commonplace or however sordid and repulsive in its use—like an abattoir—must have a shape and form of its own, and the architect who has not mustered this elementary condition of his art has yet a great deal to learn. Why it should be that the engineer who contracts for an engine or apparatus should also devise the scheme of building—that the railway engineer should be intrusted with railway stations and bridges and even hotels, and that many manufacturers find it to their advantage to design their own buildings, is a question that is not flattering to the architect, and only indicates the desire of our commercial companies and manufacturers that their buildings should be designed by men who know the *raison d’être* of the trade or commercial requirements.

The man who knows architecture simply as a matter of orders or styles; who thinks he has discharged his professional duty if he designs a factory simply as a brick shell with floors and staircases, relying upon the engineer to fit up the necessary machinery, gearing, and overhead pulleys and apparatus, is not the man the manufacturer or commercial company wants. It is like employing two architects where one should be sufficient. The engineer and boiler-fitter have probably to take down partitions, or to make larger entrances and alter floors—in fact, to pull down and reconstruct what the architect has done, and, therefore, the cost is increased. We know of many instances in which the architect’s work has had to be done over again. Solidly-built structures have had to be knocked about to enable the boilers to be introduced. Again, the arrangement of belting and pulleys in workshops often requires alteration; belt-holes in the floors are necessary to be made, and other details which might have been all provided for if the architect had been acquainted with the mechanical wants.

Since the introduction of electric power in workshops an important question has arisen as to the design of buildings of this sort: the walls and roofs may be lighter, and less room is necessary in the ground floor. The motors are small. In great clothing factories, as we see in the Yorkshire towns, hundreds of sewing-machines, hand knife-saws, and other tools are driven by electric motors and shafting, these being placed under the floors; the machinery is nearly all out of sight. The result is that much lighter factories are required than those originally erected, as the loads are smaller, and the same thick walls and heavy pillars are not wanted. The question for the architect here is simple shafting and belting *versus* electric driving. A small building may be more profitably fitted with the former; but in the erection of new large factories or workshops the electric power is more economical, and the working expenses are reduced proportionately. Also in the old

buildings vibration had to be provided against which was set up by the belting; but an electric cable is not only lighter, it does not cause tremor. We mention these details as bearing on the design. In workshops where heavy weights are lifted and carried, the electric overhead traveller, now used largely in America, is rapidly supplanting the old rope-driven crane, and is working a revolution in the mode of construction of foundries and workshops. Who knows but that in a few years we shall see electric motors employed in various trades and manufactures, altering entirely the construction and equipment of buildings?

Taking the class of buildings which minister to health and cleanliness, like work-houses, hospitals, and baths, &c., the advance made has been rapid. Clinical medicine and the healing art have entirely revolutionised the old ideas of hospital plan and construction. Compare, for example, the older buildings erected in the early part of the century with those of recent construction, such as the large fever hospitals at Hither Green, near Lewisham, and Tooting. In these buildings hygienic construction has been developed to a degree exceeding the architect’s expectations. Science and nursing requirements have outstripped him, and we cannot yet boast of the architecture of our hospitals as an artistic expression. Before long we may see a group of pavilions even on the *échelon* plan treated architecturally, and in a few of the latest buildings there are evidences of a better understanding between medical requirements and art. A new departure seems to be taken in providing buildings on the large hotel system for the working classes. Lord Rowton’s liberal schemes for providing accommodation on this plan, both near King’s Cross, and just lately at Newington, are steps in the solution of a great social problem. The promoters of these schemes have been endeavouring to provide for a large mass of our great city toilers the comfort of a club or hotel life. Provision for buying and cooking their own food, large dining-room accommodation, amusements and recreation, and cubicles for single men are provided. This problem is a new one in architecture. Our great “metropolises” or hotels, where luxurious accommodation and living are to be found, stand on a different level. They are erected by rich landowners on seaside sites or by companies in our large cities, and they are easily put into palatial form. Architectural embellishment and luxurious fitting-up are not spared, and ample means are forthcoming; but in a huge working man’s “metropole” the difficulty is to make the simple structure and plan tell or express itself agreeably. These are a few instances in which utilitarian and commercial objects have come before the architect. That he has been fully prepared to make the most of his new materials we cannot admit; but there seems a desire to grapple with these problems in a more honest and true art spirit.

The late terrible destruction of a densely-built part of the Metropolis by fire is a warning that in structural science we have something yet to learn from the past. What we have done in this direction has been too much in piecemeal. We have excellent fire-resisting materials, but have not used them to the best advantage. It is clear, also, that while we have been improving and patenting inventions, we have left unguarded the openings and channels through which the enemy advances. But we have so recently dealt with the subject, we say no more here. One other enemy almost as insidious and destructive of our buildings is the advertising hoarding. It is a product of our commercial and competitive age which the architect will probably have to deal with in the future: how to restrain it or to make less offensive and obtrusive to our sight. The illuminated advertisements of beef products, pills, and

soap are now threatening the façades and sky-lines of our finest squares and thoroughfares; even the Athens of the North has only just averted the infliction of these commercial *entrepreneurs* by the opposition of the Lord Provost and municipal authorities.

Scientific classification and administration are other facts which the architect is called upon to learn. A large proportion of his buildings are intended to accommodate a number of rooms and persons having different functions. A municipal building, for instance, has to provide for various officials, and these have to be classified in the place. The hospital has also to be arranged on an administrative basis for different classes of patients, and the offices are arranged to afford economical administration. In short, the principle of classification enters very largely into various kinds of modern buildings like schools and libraries, and the architect who is ignorant of the functions and requirements of those he has to provide for is hopelessly at sea, and cannot possibly design his buildings to meet the wants of our age. We have pointed to a few of the more important of the new conditions and movements which affect the architect. Whether or not he will grasp them and turn them to account is a question of time. At present there is a great deal of friction, if not inertia, to be overcome. Society likes to move in old or new grooves; architects are wedded to particular schools and styles;—so there is also a strong personal equation to be reckoned with the crafts contending for collective arrangements—a power which shall recoup them for the loss of their individual position. It is rather hard to see how the future will be cast; but these are all agencies in the outlook of the next few years.

THE BATTERSEA PUBLIC BATHS AND WASHHOUSES COMPETITION.

THE three premiated designs for these baths are on view at the Municipal Buildings, Lavender Hill. These have been awarded the premiums of £100, £50, and £25; the first to Mr. F. J. Smith, of Great George-street, the second to Mr. J. Hatchard Smith, F.R.I.B.A., and the third to Mr. A. Hessel Tiltman, F.R.I.B.A. We hardly understand on what principle the assessor in this case has made his selection, if the terms of the instructions are adhered to. Both the second and third have unquestionable merits of plan and design which appear to us to have been underrated, as we shall point out after describing the main features of the plans.

The first premiated plan, as in all the three others, places the large swimming-bath along Cringle-street facing north. It is 150ft. by 50ft., with an official corridor on the south side. The reading-room, of the size prescribed, occupies the acute angle between Cringle-street and Battersea Park-road, and runs to a point—an unsatisfactory mode of returning the two fronts, and contrary to the conditions, which say the public reading-room should be on the first floor with the committee and club rooms, &c. The main entrance to the swimming-bath is on the Cringle street front, near this angle. Close to it is a small entrance to the reading-room. The slipper-baths for women, first and second classes, adjoin the reading-room on the Battersea Park-road front, with entrance, and one ticket office is placed between it and the men's entrance to their slipper-baths, which are located on the south side. Adjoining these entrances are the superintendent's office and stairs to offices at the south-east corner. There is also a stair entrance to gallery, adjoining the women's entrance in Battersea Park-road. The slipper-bath entrances give access also to the swimming-bath at one corner. The washhouse, with 67 drying horses and laundry, are placed at the other

end on south side, a space intervening between the washhouse block and the men's slipper-baths. A separate entrance at the end of main front in Cringle-street is provided to washhouse, and the artists' rooms and separate artists' corridor abut on the end of swimming-bath. On the first floor over the men's slipper-baths is the establishment laundry and towel-room, and the superintendent's apartments and committee-room face Battersea Park-road. The lighting to slipper-baths and waiting-rooms is by skylight. The section shows an iron rib roof over large swimming-bath. We certainly object to the position and shape of the reading-room on ground floor; the windows on both sides come too close to the acute corner, and would be seen through; the club room, too, at end of large bath and behind entrance hall, is small, and it would have been better placed above. The walls of main fronts are built to the outer limit of the boundaries, and thereby lose the effect that would be gained by setting back a little. The Battersea Park-road front is unrelieved and flat, and the squareness of the reading-room is sacrificed. The elevations have ornamental gables, and are treated in a Renaissance style. The plans are neatly drawn and coloured, and the details have been fairly worked out. A correspondent writes expressing doubts whether this design can be carried out as planned, as it infringes the L.C.C. regulations requiring the entrances and exits to be in different streets.

The design by Mr. J. Hatchard Smith places the main elevation towards Battersea Park-road, and the author has avoided the acute and unpleasant sharpness of a straight wall by breaking up his front with the various entrances to the baths and in preserving right angles. This has been done at a little sacrifice of breadth, but the result is more architectural. The entrances from this front give access to the swimming-bath, men and women's slipper-baths, reading and club-room. One of the main features of the plan is a large entrance-hall to the swimming-bath at this end of it, the men's cloak or swimming club-room, lavatories, &c., being put at the corner of the site. The entrance to men and women's slipper-baths are separated by the ticket office, and have separate vestibules and halls, each with its own waiting-room at end; and the superintendent's office is placed centrally, so as to allow of one supervision—a very desirable point. The women's first and second-class baths are on south side, and the men's adjoin with a small light area between. The closets are well ventilated into open areas. The author has considered also the use of the large bath for entertainments. The large vestibule at the main front before mentioned, and the staircase at the extreme and alternate corners, together with lavatory accommodation, &c., enable a large assembly to disperse without danger, in addition to the exits on ground floor. The public laundry and washhouse is placed, as in the last, at the west end approached from Cringle-street. This part of the plan has been well considered; the entrance corridors are so planned as to prevent confusion and crossing, the women entering by one entrance and leaving by another. The author here introduces a crèche and waiting-room near entrance, with closet and lavatory accommodation. The establishment laundry is below the entrance to slipper-baths; a towel lift from the laundry in basement to superintendent's office on ground floor is a good point of some value which other plans do not show. Subways communicate with them. One omission on this plan is an official corridor connecting the baths and washhouses. Again, we notice that the committee and superintendent's rooms are well situated on the first floor, approached by a staircase as required leading from entrance-hall, and the w.c. and lavatory accommodation for the

committee are well placed and ventilated. The library and club-room are on the first floor also. These rooms are of the required size. The plans show all square rooms—an advantage we have pointed out. The style adopted in the elevations and perspective, despite good drawing, is of a too Domestic character.

The design marked "M," by Mr. A. Hessel Tiltman, is characterised by ability. The corner between the two fronts is rounded, and the swimming-bath is pushed far enough to the east to give space for the women's slipper-baths, with an entrance from Cringle-street, an entrance to the establishment-hall as well as a stair approach to gallery, thus enabling the assembly to divide itself easily. The public washhouse for 60 washers, 65ft. by 40ft., is at the south-west corner, with a separate corridor access and ironing-room in front on one side. On the south side at the other end of site are the men's slipper-baths, well arranged with their own entrance from Battersea Park-road, also to the swimming-bath through an entrance hall. At the extreme south, and on this front, is the stair approach to reading-room, and there is also a good stair access to gallery of large swimming-bath. These form a recessed part of the elevation on this side, and are treated externally in a distinct manner. The end of large bath or hall is ingeniously canted, and at the corner between the main fronts is a male performers' club-room and conveniences, with distinct entrance for artists in the Battersea Park-road front. Another entrance to hall is obtained between the canted end of hall and the artists' club-room. The swimming-bath or entertainment hall, of the specified size of pond, has 114 movable dressing-boxes. The ticket office serves for the large bath and the men's slipper-baths. A gallery surrounds the larger bath on three sides, and approached by two entrances at each alternative end—one in the Battersea-road and the other in Cringle-street. The swimming-bath or hall is lighted on both sides and at end. The iron roof comprises a wide centre span over main bath with two small spans over the side galleries with iron columns supporting the trusses, which is more pleasing than a single-span roof over the whole. The public reading-room is in the first floor over entrance-hall and offices, and has a separate entrance, as before stated. There is also a committee-room. At the other end, a crèche 35ft. by 18ft. is shown over the washhouse waiting-hall—perhaps a less desirable place than the ground floor. The entrance to washhouse and ticket-office and matron's room are well placed, and the ticket office serves also for entrance to women's slipper-baths. The establishment laundry is in the basement. There are subways for pipes below the dressing-boxes, and the whole of the engineering details are well studied. The plan has a working corridor on the south side of swimming-bath, returning at the end between the women's slipper-baths and washhouse. Each washing compartment includes two troughs for washing and rinsing, the other for boiling, and two drying horses. The exterior is appropriate, and handled with much breadth; the corner to main fronts assumes a circular shape above, and is roofed by a flat cupola. The main gable of hall to Battersea Park-road is well broken, and the drawings are effectively tinted in sepia.

CONSTRUCTION OF ARCHES IN CONCRETE.—XV.

It has been pointed out that, so far as general dimensions, proportions, and form or profile of the experimental arches may be regarded, the only difference between them was that the wrought-steel structure was given a polygonal, instead of a circular, shape. The skeleton elevation of the half-arch in Fig. 1 illustrates this

very clearly, and also the braced trussed staging which was erected to support the platform P I, upon which the testing loads were accumulated in successive tiers. There is a disadvantage connected with the employment of the polygonal form instead of the parabolic, and even the circular, which should be noticed, as it tends to counterbalance to some extent the greater facility afforded by it for the building up and erection of the work. The flange-plates and angle-steels bend to a more or less degree as the loads increase, and ultimately secondary stresses, and, consequently, additional deflections, take place. In determining the sectional area of the ribs, the unit stress was made equal to five tons per square inch for a working load of 1.12 tons per lineal foot. A detail of the elevation of a part of the rib to an enlarged scale is shown in Fig. 2. Notwithstanding the comparatively small depth of the rib, small angle steel stiffeners, SS, measuring 2½ in. by 2½ in. by ½ in. are riveted to the web at intervals of 4 ft. 6 in. The stiffeners are double, one upon each side of the web of the rib, and were not shown on the cross-sections of the arch given in our last article, to avoid confusing the figures.

The steel rib was articulated or hinged at both springings, but continuous at the crown, and the arrangement for effecting the pivoting so as to allow of the slight degree of motion required is shown in Fig. 3. A pair of similar castings, *a* and *b*, bear one upon the upper and the other against the lower half of a steel pin 3 in. in diameter. The rib is bolted to the upper casting *a*, and the lower *b* is connected in a similar manner to the solid stonework of the abutment, and the line A B represents the axis of the arch. In this manner the rib, under the influence of increasing loads, can move a little round its pivot as a common centre, and thus, so to speak, accommodate itself to the varying conditions of the loading. As the whole subject of hinged arches is rather complicated, and presents many difficulties to the beginner, a few words of practical information and advice will not be superfluous. In the first place, arches may be divided into four classes:—

(1) Arches without pivots, (2) arches with one pivot, (3) arches with two pivots, and (4) arches with three pivots. Taking each of these in progressive order, let A E B in Fig. 4 represent the axis or centre line of an arched rib solidly fixed at the ends, and P a load at any point above the arch. If, as occurs with two of the other classes which will be investigated, the reactions meeting at the point P passed through the points A and B—that is, through the terminations of the neutral axis of the rib—the problem would be much simpler of solution. But they do not, but really take the direction of lines which may be situated either above or below those terminal points. The intersection of the reactions with the loads placed at different points of the arch will occur along a certain curve or locus, which can be found by an intricate and tedious mathematical investigation, which is too elaborate to be entered into at present. Suffice it to say, that for all practical purposes this curve, under certain conditions which prevail with sufficient accuracy in properly designed and constructed metal arches, assumes the form of a straight line, which is represented in Fig. 4 by the line C D. To find the exact position of locus C D, put *r* = rise of the arch and *x* the distance of the line C D above the axis at the crown E. Then we have—

$$x = \frac{r}{5}$$

This is the equation of a straight line parallel to A B. If, then, we knew the vertical distances to A B. If, then, we knew the vertical distances or ordinates above or below the points A and B, the direction of the resultants of the load P could be found, and the resulting stresses throughout the arch calculated by moments or by diagram. Let *x*₁ and *x*₂ equal these distances, which will not be the same; put *s* for the half-span of the arch, and *d* for the distance of the load from the centre of the rib, then the value of *x*₁ is given by the equation—

$$x_1 = \frac{2}{15} \left(\frac{s + 5d}{s + d} \right) r$$

and that of *x*₂ becomes—

$$x_2 = \frac{2}{15} \left(\frac{s - 5d}{s - d} \right) r$$

It must be borne in mind that, although one point in the reaction lines is at the intersection of the vertical load line and the straight line or locus already determined, and is thus found for any

position of any or of all the loads, yet the values of *x*₁ and *x*₂ must be found separately for all the loads. Since the reactions do not pass through the ends of the axis A and B, there is, therefore, in addition to the vertical and horizontal com-

FIG. 1.

FIG. 2.

FIG. 3.

ponents of the reaction, a bending moment which varies as the position of the load changes, and must each be sufficient to maintain the direction of the ends of the arch constant and invariable. This is equivalent to stating that the bending moment must be of a magnitude sufficiently great

FIG. 4.

FIG. 5.

FIG. 6.

to insure that the tangents at the ends of the arched ribs shall have a constant direction. According to the position of the load, *x*₁ may be positive, and *x*₂ negative—that is, one may be above one of the points A or B, and the other below it, or both above or both below. Type (2), or the arch with only one hinge, is so rarely used, that it may be passed over, and we may take up number (3), which is the most used of all of them.

Referring to Fig. 5, in which the arch is pivoted at the supports A and B, it will be at once seen that we have more data at our command for calculation than in the former case. For any position of a given load, P, the resultant pressure must, in order to insure equilibrium, pass through the pivots at A and B; and thus we have one point in each of the two resultant reactions determined *a priori*. If we know the exact position of the load P upon the locus or line C D, which, in this instance, is a curved, and not a straight line, as in type (1), our difficulties would be speedily at an end. As it is, the different points in this curve are best obtained analytically by the aid of the calculus; but it will be sufficient for our purpose to give the result in such a simple form as will enable our younger readers to make the necessary calculations themselves. Employing the same notation as before, and taking *x* as the ordinate, measured as shown in Fig. 5, we have—

$$x = \frac{32 s^2 \times r}{25 s^2 - 5 d^2}$$

It is obvious that by shifting the position of the load P—that is, taking as many values for *d* as may be desired—we can obtain as many points as we please in the line or locus C D, and it can be located and drawn in to any wished-for degree of accuracy and minuteness. Having located the curve C D, suppose it were required to determine the resultant pressures and vertical reactions due to the action of another load P₁. Draw a vertical line through the point where the weight is situated on the arch to meet the locus on the point P₁. From P₁ plot off to any convenient scale P₁ T equal to the weight, and, from the same point draw the lines P₁ A and P₁ B, which will give the directions, but the directions only, of the resultant pressures. From the point T draw T V parallel to P₁ B, then the lines T V and P₁ V will give the amounts of the resultant pressures at B and A. Draw V N parallel to A B, and P₁ N and N T are the vertical reactions at A and B.*

There remains now only type (4) to be considered, which is the simplest of all. It is represented in Fig. 6, and is closely analogous in principle to a pair of straight rafters, one of which has one end at A, the other one at B, and both have a joint intersection at E, while the thrust at the abutments is substituted for the rod in the roof. In Fig. 6 it will be seen that we have another point through which one of the resultant reactions must pass. That point is the third pivot placed at the crown of the arch. Let P represent any weight situated at any point of the rib, and let a vertical line, P W, be drawn through the point. Through the pivots A and E draw a line, and prolong it to meet the vertical, and from the pivot B draw B P, or from P draw P B. If P W be made equal to the load P, and the same lines drawn as in the left half of Fig. 5, then P R and R W are the resultant pressures at A and B, P V and V W the corresponding vertical reactions, and R Y the horizontal thrust.

We may now consider, having rejected the arches belonging to the (2) class, which of the remaining three possesses the best claim to practical consideration, and is the best adapted for practical use. It is not possible to lay down too hard and fast a line upon this question. For bridges of comparatively limited spans, and in which the live or moving load bears a large proportion to the dead load or insistent weight of the structure, the arch with three pivots (4) one at the crown and one at each springing, is not so well adapted for use as the first and third types. The introduction of the additional pivot at the crown diminishes the rigidity of the rib, and, in fact, causes the whole structure to become somewhat rickety. But should the conditions become reversed, that is, should there be no moving load, or should it bear but a small proportion to the dead load, then the fourth type will answer very well, both as regards economy and other features. The arch hinged only at the springings, and continued over the crown, appears to be the one most employed by engineers at present, and deservedly so. At the same time, class (1), which may be termed the primitive type, has always given complete satisfaction, whether as a roadway or a railway bridge, and for large spans, is quite as economical, and a great deal stiffer than any other. It is, nevertheless, unquestionably out of date, and in future the selection will lie between the third and fourth

* Those who wish to study this subject further should read the works of W. M. Patton, A. Jay, Du Bois, Malverd, A. Howe, W. H. Warren, W. Ritter, W. Burr, H. Greene, and other writers.

class. It may be remarked that the function performed by the web of the rib is common to all, and therefore, it does not enter into competition in making a choice of one type or the other. A word or two about stresses caused by variation of temperature. In the three-pivoted arch, these are equal to zero, since, as already explained, each semi-arch can rotate slightly, but at the same time freely, about its pivots and thus nullify all changes of form due to alterations in temperature. But stresses of temperature are set up in the arch with two pivots, whether the temperature rise or fall, the only difference consisting in the fact that if a rise occasions positive stresses in the flanges, a corresponding fall will induce equal ones of the same amount, but opposite in sense or character. It must be remembered that temperature stresses must be added to those already found for the two descriptions of loading to obtain the total stresses on different parts of the arch. The weak point in the unpivoted arch (class 1) is that the temperature stresses are excessive when compared with those of the pivoted type, and there is no doubt that this feature is the principal cause of its use being discontinued. These stresses, similarly to those due to the action of the dead and live loads, will not pass through the ends of the axis of the rib.

During the testing of the steel arch experimented upon, observations were made to ascertain and record the vertical and horizontal deflections at certain fixed points previously selected along the longitudinal axis, and also the angular displacements at the same points, due to the different rates of loading. From these observations, formulæ were deduced, and tables calculated which enabled certain constants to be computed, which would serve for other examples, and effect a consequently large saving in time and labour. The results of these tests will be briefly described, and some remarks and comments made thereon in our next and concluding article. T. C.

NOTES FROM EDINBURGH.

A RETROSPECT of the closing year shows it to have been one of the busiest in building operations of many tabulated, whilst there is every prospect of 1898 being another record year. The standard or minimum wage for masons has not advanced; but the maximum is 10½d., and other trades share in the general advance. The works which have made progress during the year are still far from completion, being of unusual magnitude. The new North Bridge has been completed so far as it can be, pending the completion of the new work at its extremities. The reconstruction of the railway buildings has also made good progress, and the various platforms have been made. The whole range will be under glass, and the sheds will extend far to east and west of the bridge. The external appearance will be much the same as formerly. The extensive series of roofs is carried on lattice girders and strong iron pillars about 30ft. apart, and the glazing (which is the Penicuik patent) is interrupted only by gutters of no great breadth. The height is not such as to obstruct a view of the arches of the bridge, and, provided some better arrangement than formerly is made to keep the surface clean, the great field of glass will not be so much of an eyesore as it has been. The building, at the north end, now makes some appearance at street level, and what may be styled the basement is complete on the railway side. The company, it appears, having purchased the Waterloo Hotel, intend to fit up their offices there, thus giving the whole of the building at the north end of the bridge to the purposes of the hotel. This arrangement will make an important addition to the work of the coming year, as much alteration will be required. The past year is memorable for the opening of the McEwan Hall, begun seven years ago, and which has been well illustrated in the BUILDING NEWS. Although the ground plan appears simple enough, the interior is unique in its proportions and probably unequalled in the splendid design of its decorative detail. The foundations of the new fever hospital have been laid, and work of a similar kind has been carried on during the year in connection with the extension of the Municipal Offices.

Another important addition to the architecture of the city has been made during the year in the new Prudential Insurance Buildings at the south-east corner of St. Andrew's-square. The edifice

is now completed in the mason-work, and is notable for the contrast in its style as compared with any of the buildings in the square. Its most characteristic features are the large, wide openings of the ground floor, partly fitted for shops, and the many vertical pilaster divisions over this floor, which terminate above a very heavy cornice in arcading ornamented with vigorous sculptured panels. These at some distance appear to be intended for tongues of flame, but closer inspection shows them to be sculptured foliage of Gothic character—in either case appropriate emblems for the decoration of a fire and life insurance institution. The whole is an interesting combination of Gothic proportions and Classical details. The base, or ground floor, is polished red granite, which, in strong light, is hardly distinguishable from the polished red sandstone above. The best feature is the angle turret, and its treatment of the corner, which is very happily designed. The lower portion of the octagon is not, as usual, carried up throughout, but is transformed into a similar octagon—with the angle over the centre of the face beneath—with ingenious devices, which make the top lively with balconies, gables, &c.

The building of the Equitable Insurance at the north corner of the square is now well above foundations, and will also make a notable addition. It is being carried out in the red freestone, from one or other of the Dumfriesshire quarries. The demand for this stone is very great, and new quarries are being opened.

The Standard Insurance Company, it is said, will reconstruct their premises at the north-west corner of the square. The Scottish Provident Society are enlarging their premises, which adjoins the remaining corner. This corner house is the one occupied by David Hume when he left the Old Town for the New. It is much disfigured on both frontages by the shop and shop floors above, which leave little but the upper floor and gable visible, and the sooner the reconstruction of this remaining corner is in hand the better.

The conversion of the old tramways into the cabled system has been proceeding, and is well forward with the engine stations. The number of tenements of middle-class and workmen's houses erected during the past year is very large, but houses of the highest class have not been many. The U.P. Church, having sold their church in Infirmary-street, the building is now fitted up for the Working Men's Club. The new church is built in Fountain Hall-road, in Early English Gothic, with wide nave and narrow passage aisles, a hall, and other accessories. The Free Tron congregation has left the church in Chambers-street, disposed of for business premises, and is building a new church on the Dalkeith-road. One new school has been added during the year in Preston-street, to accommodate about 1,000 pupils, at a cost of £15,000, and the end of school-building is not yet.

The Gas Trust are in terms for the purchase of part of the Grantham estate as site for new gasworks, which means another large outlay for the advantage of the building trades. It is said by those who ought to know, that this great scheme can be carried out without adding to the rates. Nothing has surprised the public more than the great increase in consumption of gas within the city, despite the increasing demand for the electric light, the increase on last quarter alone having been upwards of 2,000,000c.ft. It is accounted for by the increasing number of gas-engines and cooking ranges. The present electric plant is inadequate to supply the demand for the light, and a new station in another quarter of the town is to be provided. The new hospital for the Castle barracks is far advanced, but not finished sufficiently to say how it may affect the appearance of this interesting feature. Its altitude, in any case, will be an advantage, and will make the large block of street-like buildings on the west less conspicuous. So far the new building is of the plainest possible description. The Royal Engineers, or whoever is architect for this military post, are not happy in their architecture as a rule, and the Cockburn Association have been instrumental in preventing an addition being made to the barracks on the south side of the Castle-road, where the married soldiers reside.

No progress, seemingly, has been made during the year, in solution of the difficulty of finding a site for the Usher Hall. The difficulty lies in finding a desirable site which will not cost as much or more than the hall itself. The site at the

canal basin cannot be had from the N. B. Ry. Co. The most economical and central site is the one in Chambers-street, where the hall would be a fitting companion to the Industrial Museum and University buildings, and within easy distance of the Council Chamber. Another site, less costly than others, is spoken of in George-street, where St. Andrew's Church now stands. It is said that the congregation are not indisposed to migrate to a more accessible neighbourhood farther west, and that £14,000 would be required for it, and probably as much more for premises behind the church.

The new North Bridge-street buildings cannot be much longer delayed; but in this matter also no decision has been come to, and it seems likely that nothing will be gained by rejecting the offer of Mr. Moss for purchasing the site for £200,000.

THE ECCLESIASTICAL ARCHITECTURE OF SCOTLAND*.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

MESSRS. DAVID MACGIBBON AND THOMAS ROSS have just produced the third volume of their replete history of what remains of the Church buildings of Scotland from the Earliest Christian times to the 17th century. The present book, in concluding the work, opens with the Late Pointed Gothic Period, and "from the series of examples given in this volume there can scarcely be any question as to the gradual deterioration of ecclesiastical architecture which occurred generally throughout Scotland during the latter half of the fifteenth and the first half of the sixteenth centuries, and it is certainly surprising to find some exceptionally good work in a few structures of that period." French influence rightly accounts for much of this excellence, and "latterly the office of King's French master-mason became a regular Court appointment, and the position was held by several Frenchmen." James IV. and James V. both employed master-masons from France, and the Merlions, a family distinguished in this connection, are found still at Linlithgow, Dunbar, Ravenscraig, Perth, and other places.

No new churches of great scale were undertaken during the Late Gothic period. Some of the older buildings were either reconstructed or restored. The largest new church of this time is that of Trinity College in Edinburgh, founded by the widowed Queen of James II. The ecclesiastical edifices north of the Border, generally speaking, are usually much smaller than English churches, and often consist of a nave without aisles, or transepts and choir minus the nave. Many, no doubt, were intended by their designers to have been cruciform, but, for various reasons, have never been completed. The French fancy for the apse is often realised in Scotland, and this feature is distinctly characteristic of the Late Pointed period in Scotland. Another and more distinguishing mark of this Scottish style is the vaulting, the pointed barrel vault being almost universally employed. Domestic features of an architectural kind were freely imported into ecclesiastical buildings, such as the barrel vault carrying a stone roof, a very notable and common arrangement. The windows had to be kept low down to permit of the main vault springers starting clear of their heads. The intersection of vaulting gave way to superficial surface ribs of an ornamental kind, but which structurally serve no purpose. A roof of carefully-wrought flagstones arranged in courses was the common mode, and sometimes the stones were hollowed in the centre to carry the water away from the joints. At Rosslyn the same stone which forms the interior vault is made also to form the outside roof, the exterior pitch of the roof being curved like the interior. This, however, is quoted as an exceptional instance. Generally speaking, there is little connection in matters of detail between the contemporary church work in England and France with the Late work in Scotland, though examples of Flamboyant tracery may be described as not very uncommon.

The present series of buildings illustrated are Paisley Abbey, which it will be remembered, has a very remarkable triforium, with semicircular openings filled with pointed arches and cusps, in design not unlike the plainer triforium at

ST. SALVATOR'S CHAPEL, ST. ANDREW'S.

Dunkeld Cathedral in Perthshire. This church is a ruin only now, but it is possessed of the greatest interest, as mainly representing the Third Pointed period. Passing Iona Cathedral and St. Machais Cathedral, Old Aberdeen, St. John's, Perth, and the famous Dundee Church Tower, we arrive in the book at the celebrated Collegiate Church of Rosslyn, from which the authors have lent us two of their sketches, reproduced among our lithographs to-day. In some respects this is the most remarkable piece of architecture in Scotland, and had the church been finished in the same spirit as that in which it was so far carried out, it would have gone a long way towards realising a poet's dream in stone. Much of its detail is, however, crude, and in construction the principles of Gothic work are not adhered to; indeed the authors of this book tell us that Mediaeval method is ignored. For all that, the exuberant fancy of the designer manifests itself so abundantly in the profusion of his conceptions that the work as a whole stands alone. It was built by Sir William St. Clare, third Earl of Orkney, in the middle of the 15th century, and when he died, in 1484, he seems to have left the building very much in the condition in which we now find it. Both inside and out the choir is remarkably symmetrical in its parts, the bays are all of the same dimensions and correspond very closely in general detail. The pinnacles are ornamented with rosettes on the angles and crochets on their roofs. The richness of the design is well illustrated by the accompanying drawings, which only form a small part of the

sketches with which the church is represented both inside as well as out.

The Church of St. Salvator is the only portion of the college buildings which still survives. It is attached now to the united Colleges of St. Leonard and St. Salvator, which form the existing University of St. Andrew's. There are no windows on the north side of the church, which is an oblong building, 107ft. long by 28ft. wide, with a three-sided apse at the east end. The arched porchway is illustrated by the sketch, which also shows the base of the tower—an unbuttressed form common at this period in Scotland. On the ground level this tower formed the gateway to the College. King's College Chapel, with its exceedingly picturesque tower, is represented by the accompanying sketch. It is located at the north-west corner of the college quad.

Like the chapel of St. Salvator at St. Andrew's, it is long and narrow on plan, measuring inside the walls 122ft. long by some 28ft. wide. It is divided into six bays by big projecting buttresses with large traceried windows between on the north side and to the apse. Over the west door, which is mean in its proportions, there is a four-light window divided by a massive straight pier and loop-like tracery, as seen in the picture. James IV. began this chapel in 1500. The finishing of the tower forms one of the three crown steeples of Scotland, the two others still standing, from among the many of a like kind of which the Scotch could once boast, being St. Giles', Edinburgh, and the Tolbooth, Glasgow.

SACRAMENT HOUSE, DESK FORD.

King's College tower is about 63ft. high to the top of the battlements. From that point to the base of the lantern pillars is about 16ft.; from thence to the top of the cross is some 20ft. Mr. J. C. Watt, of Aberdeen, gives the total height as 99ft. The upper part was rebuilt about 1640 by Master Mason George Thomson, after a severe storm which greatly damaged the original some few years before. The tower, with most of the chapel, is built of sandstone.

Stirling parish church is one of the best-preserved ecclesiastical buildings in Scotland. The plan which we print shows the scale of the church, measuring, as it does, including the apse and tower, some 200ft. long. The interior sketch illustrates the choir, and Messrs. MacGibbon and Ross publish a good many drawings from the same building. There is an Easter sepulchre in the north aisle. From Deskford Church we have reproduced a drawing of the sacrament house as representative of many similar structures. It is uncommonly large, measuring 8ft. high by 3ft. 6in. wide. Two angels above the ambry are shown supporting a monstrance with a quasi-buttress on either side, and several inscriptions and enrichments. The vine is quaintly introduced in the remaining carving. The work was done, according to the inscription, in 1551, a date which would lead one to expect very debased Gothic detail, and here we note the influence of the approaching Renaissance. Our next example shows this style in its developed dress nearly one hundred years later: the Kinnoull monument from Kinnoull Church aisle.

The design is pompous in the extreme, and inspires none of those feelings of reverence suggested by the monuments of the Middle Ages. It occupies the entire end wall of the aisle, and is marked by a Roccoco feeling untrammelled by the limitations of a purer style. The work is eminently debased; but it is picturesque and queer, while suggesting that George, first Earl of Kinnoull and Chancellor of Scotland, is represented impersonating a professor of legerdmain, introducing a show about to commence. Morham Church, Haddingtonshire, carries the student to a remote village to see one of the latest examples which Messrs. MacGibbon and Ross have to show us of church building. The unusual work to which they refer is really confined to the elevation of the north aisle, dating about 1724. It is uncommon in Scotland to find work of this type in church building, and there is in this example a degree of originality and quaintness which in a way becomes suggestive, while at least it is refined and not vulgar, like the Weem Church Monument, the last full page picture-subject in this book, and which we mention only to condemn.

We close the volume with a sense of due indebtedness to its authors for all their painstaking endeavour to build up and illustrate so much interesting material from out-of-the-way places, and although possibly, and as a matter of necessity, perhaps, much which they have so carefully garnered must have mainly a local interest, there is so much more of wider scope and of larger importance. These three handsome books undoubtedly will command readers among all who really seek to know all about the ecclesiastical architecture of Scotland. The printing is excellent, and the blue buckram binding is strong and suitable.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—XIV.

By AN ASSOC. INST. ELECT. ENGS.

DISTRIBUTION.—(Continued.)

THREE-WIRE SYSTEM.—From what has already been said it is clear (1) that smaller conductors may be employed for distributing electrical energy, and, consequently, considerable economy may thus be effected by using high voltages for distributing purposes; (2) that independence of the individual lamps is secured by means of parallelism; and (3) that the difficulty encountered by the electrical engineer for lighting large buildings or institutions and extensive areas, is that of increasing the range of distribution—i.e., the permissible distance between the generator and the lamps without undue loss or variation of pressure, or violating the laws of economy of conductors. One of the solutions of the problem of economical distribution of electrical energy consists of an extension of the simple parallel system and a modification of the multiple series system, forming what is known as the *three-wire system*. This system was invented simultaneously by Dr. Hopkinson in this country, and by Edison in America, and, as proved by the numerous cases in which it has been adopted, and as we shall presently see, it is an economical method of distributing electricity for lighting purposes. As may be inferred from its name, there are in this system three conducting mains, the centre one of which is a neutral or balancing wire, and, unlike its fellow in the multiple-series system, it is connected to an intermediate point between the two dynamos so as to be in connection with the positive terminal of one machine and the negative pole of the other. The arrangement is represented in Fig. 29, in which P and N are the positive and negative mains respectively, and M is the neutral or balancing wire. The source of electricity consists of two exactly similar dynamos connected in series, each giving the voltage required by an individual lamp, so that twice the pressure of the simple parallel system is used in the three-wire system. These dynamos, D₁ and D₂, in the figure, are shunt or compound machines, and it will be observed that the lamps are connected in groups of two in series, one on each side of M.

The essential feature of this system is that double the lamp voltage is maintained between the positive and negative mains, whilst the usual pressure is used for the service or house mains, which are connected between the middle wire and either the positive or negative mains, as shown in the figure. It is thus clear that the system is

equivalent to two distinct parallel systems, the middle wire of the three-wire system playing the same function as the return of the first of the two parallel systems, and at the same time forming the lead of the second of the two systems. In other words, the part of the middle wire between the source and the first lamp is traversed by a current equal to the difference between the currents required by the lamps on the two sides of

FIG. 29.

the middle wire. A representation of a complete installation is shown in Fig. 30.

As we have already stated, one of the advantages of using the three-wire system is the economy in the copper which results, and to decide what the gain really is, it is usual to compare the weights of the copper required for the conductors for a simple parallel system and a three-wire system supplying the same number of lamps. And as the statements made with reference to what the exact saving in copper is, vary considerably, it is necessary to point out that two factors may enter into our calculation—i.e., (1) the density of the current decided upon, and (2) the permissible drop in volts. Then, again, the middle wire may, or may not, be of the same section as the outside wires; and for lighting purposes it is obvious that the supply mains should be so arranged that the number of active lamps in use at any time on one side of the neutral wire is approximately equal to the number of lamps lit simultaneously on the other side.

By paying proper attention to this matter when designing the system, a considerable saving in the weight of copper may be effected with

FIG. 30.

respect to the middle wire, for in practice it is found possible to distribute the supply mains so that not more than half the maximum current, passing along the positive or negative distributor at any time, traverses the neutral conductor. Very often it will be considerably less than half; consequently the area of the cross-section of the middle wire may, and often is, reduced to half that of the outside wires. Obviously the most care is required when the district lighted consists

partly of business premises and partly of residences. For large installations, where the number of lamps working at any time are liable to vary, it has been found convenient and possible to introduce switching arrangements for transferring a portion of the load from one side of the middle wire to the other. By this means any installation may be subdivided into two halves at any time, and balance between the two loads readily secured, so that the middle wire never carries much current.

The section of the middle wire, however, should not be less than that of the outside wires when two motors are connected in series, and are supplied by means of three wires with energy from two dynamos, also connected in series. When both motors are working, the middle wire—connected between the common junction of the generators and that of the motors—plays the part of a balancing wire, as in lighting circuits. Should, however, only one motor be at work, then one of the outer wires is passive, and the middle wire has to carry the same current as the active outside wire. In cases where several motors are grouped together, after the manner of lamps, then, of course, the same considerations apply as we have already mentioned in connection with lighting circuits.

Whilst considering the middle wire, we may, in passing, refer to the magnitude and direction of the current passing along it. Let C_p , C_n , and C_m be respectively the currents traversing the conductors, P, N, and M of Fig. 29 at any particular time; then, if the same number of lamps are in use on both sides of the middle wire,

FIG. 31.

no current passes along the neutral wire M, either from or to the dynamo, since—

$$C_p = C_n \text{ and } C_m = 0.$$

It is for this reason that the middle wire is termed the *neutral wire*. If more lamps are in use between P and M than between M and N—

$$C_p \text{ is greater than } C_n, \text{ and } C_m = C_p - C_n$$

—that is, a current equal to C_m passes along the middle wire from the lamps to the dynamo D₁. On the contrary, if—

$$C_n \text{ is greater than } C_p, \text{ then } C_m = C_n - C_p$$

and a current equal to C_m passes along the middle wire from the dynamo D₂ to the lamps. If $C_n = 0$, then $C_m = C_p$, and so on. It thus follows that each dynamo supplies the energy required individually for the corresponding groups of lamps. It is thus evident why the middle wire is also termed the *balancing wire*, and that the middle wire plays the part of a positive, neutral, or negative main at different times according to the equality or inequality of the two loads on the two sides of the middle wire. In fact, the third wire was introduced and connected to the generators because of the difficulty of maintaining an exact balance between the number of lamps on the two sides of the middle wire, without introducing special arrangements.

In Fig. 31, a special case is represented, from which it will be observed that we have an interesting arrangement indicating an equal number of active lamps on the two sides of M, and that although no current passes from or to the dynamos along the neutral wire, there are currents of different intensity and direction traversing different parts of that conductor, as indicated by the arrow-heads. By assuming that each lamp takes one ampere, we are able to give the magnitudes of the currents along with the directions for each conductor.

In dealing with the question of economy of conductors forming any system, it is evident that the calculations must be based upon some law or rule relating to the minimum cost of working. Such a rule, as Kelvin's law of economy of conductors for instance, enables us to decide upon the cross-sectional area, and the proper current density for a minimum cost of working. In what follows, it will be assumed that from the consideration of such a law, the current density employed for the simple parallel system satisfies

FIG. 32.

the conditions of the problem. Since the essential feature of the three-wire system is to employ double the pressure of the corresponding simple parallel system, it follows that only half the current will be required for the same number of lamps. In comparing the two systems—i.e., the two-wire and three-wire systems, the following cases may be considered.

Let C_2 and C_3 , W_2 and W_3 denote the currents and weights of copper respectively used in the two systems.

I.—Same Gauge and Length of Wire in the Distributing Mains.

(1) Middle wire same gauge as outer ones.

$$W_3 : W_2 :: 3 : 2.$$

(2) Middle wire half the section of the outer ones.

$$W_3 : W_2 :: 5 : 4.$$

In this case, however, it will be noticed that the drop in pressure with the three wires is only half that with the two wires. Also, when the two sets of lamps are balanced and no current

FIG. 33.

passes along the middle wire, the energy wasted in the distributing mains is as follows:—

Watts lost in three-wire system : Watts lost in two-wire system :: 1 : 4.

Since— $C_3 : C_2 :: 1 : 2.$

II.—Same Gauge of Distributing Mains with the same Fall in Pressure.

Since in I. the drop in pressure with the three wires is only half that with the two wires, it follows that with equal conductors, giving the same fall in pressure, the distributing mains will

be twice as long as for the simple parallel system. Also—

$$W_3 : W_2 :: 5 : 2,$$

if the middle wire is half the section of the outer ones, and four times the number of lamps may be used for the same fall of pressure.

III.—Equal Lengths of Distributing Mains and same Current Density.—In this case the outer distributing mains will have half the area of the wires in the corresponding simple parallel system.

(1) Middle wire same size as the outer ones.

$$W_3 : W_2 :: 3 : 4$$

(2) Middle wire half the area of the outer ones.

$$W_3 : W_2 :: 5 : 8$$

Therefore, there is a saving of three-eighths or 37.5 per cent. by using the three wires. Again, if the middle wire is passive—

Watts lost in three-wire system : watts lost in two-wire system :: 1 : 2

Also—

Percentage fall of pressure three-wire system : percentage fall of pressure two-wire system :: 1 : 2,

although the drop in volts per yard in the distributing mains is the same in the two systems, since the pressure at the generators in the three-wire system is twice that for the two-wire system. Therefore, in the three-wire system the lengths of the distributors may be twice as great as in the two-wire system if the same percentage fall of pressure is allowed in the two systems.

IV.—Equal Lengths of Distributing Mains and Same Percentage Fall of Pressure.

Since fall of pressure = ampère × resistance,

FIG. 34.

we have the same percentage fall of pressure if the middle wire is passive, when—

$$\frac{C_2 R_2}{E_2} = \frac{C_3 R_3}{E_3} = \left(\frac{1}{2} C_2 \right) \frac{R_3}{E_2},$$

that is when $R_2 = 4 R_3$; that is, the area of the cross-section of the outer wires for the three wires will be one-quarter that for the two wires. E_2 and E_3 are the impressed E.M.F.'s respectively, and R_2 and R_3 are the resistances of the distributing mains in the two systems.

(1) Middle wire same size as the outer wire.

$$W_3 : W_2 :: 3 : 8.$$

Therefore, there is a saving of five-eighths, or 62.5 per cent., in favour of the three-wire system, while the watts wasted by heating the conductors is the same in each system.

(2) Middle wire half the size of the outer ones.

$$W_3 : W_2 :: 5 : 16.$$

Another point in connection with the three-wire system which requires notice is the fact that the far end of the middle wire may be earthed. When we remember that the pressure used in the three-wire system is double that used in the simple parallel system, it is clear that the chances of leakage to earth and of accident are twice as great with the former as with the latter system, and also that the insulation should be carefully attended to. At the same time, it is evident that the potential of the middle wire is approximately that of the earth, and if the two divisions of the consumers may be assumed to have an approximately equal consumption at all times, the middle wire need not be insulated; it may, therefore, be replaced by the lead, iron, or other metallic covering often used to protect the copper, and thus permanently earthed. It, however, must be remembered that only the middle wire must be earthed. The result of earthing the middle wire is to reduce the strain on the insulation to one-half. With the middle wire not earthed, the insulation has to withstand a pressure of 200 volts, whilst with earthing the insulation has only to withstand a pressure of 100 volts. That this must be so is clear from the fact that by earthing the middle wire its potential is zero, so that the potential of the

positive main, P, is + 100 volts, and that of N, the negative main, - 100 volts.

The three-wire system is used considerably for distributing purposes and for large installations, because it offers the following advantages over the simple parallel or two-wire system.

(a) It enables the E.M.F. to be maintained in a system of conductors for electrical supply at a fixed and constant potential.

(b) It combines the advantages of higher pressures for distribution in the distributing mains, and the easy manipulation of the simple parallel system by adopting lower and safe pressures in the service mains. It is clear that more energy may be delivered because of the higher pressure used, and that larger areas may be served without increasing the losses in the mains.

(c) It permits of the independence of each lamp. Although the lamps are connected two in series on a parallel system, the failure of lamps on one side of the neutral wire does not affect the lamps on the other side; consequently, any lamp may be turned out independently of all the others.

(d) It secures a considerable reduction in the cost of the copper in the distributors consistently with efficiency and safety.

Although we have so far only considered this system as a distributing system, it is clear that it is adapted for house-wiring, and specially so for large buildings. The usual methods of adapting the three-wire system for house-wiring are shown in Figs. 32 and 33, and from the former it will be seen that small circuits are led to a main distributing board, whilst in large buildings the three wires are led in as the supply mains, from which the house circuits are divided equally between the two pairs of mains, so that the separate circuits are kept distinct from each other, and more under control.

It may also be mentioned here that not more than 10 volts are ever allowed for the loss in pressure in the mains, so that if 100-volt lamps are used the generators should give 110 volts each. It is, of course, important that the drop in volts in the mains should be determined, so that it is certain the lamps are supplied at the proper pressure, and we give here equations which are useful for determining the pressures between the two sets of mains.

Let R_p , R_m , and R_n , C_p and C_n denote the resistances of P, M, and N (see Fig. 34), and the currents for the two sets of lamps respectively. Also, let e_1 and e_2 be the differences of potential between p and m, and between m and n respectively. Then, if the generators give 110 volts between P and M, and between M and N, we have—

$$e_1 = 110 - C_p R_p - C_p R_m + C_n R_m$$

$$e_2 = 110 - C_n R_n - C_n R_m + C_p R_m$$

If $C_n = 0$ and C_p be of constant value, we have—

$$e_1 = 110 - C_p R_p - C_p R_m$$

$$e_2 = 110 + C_p R_m$$

In this extreme case the second dynamo, D_2 , is doing no useful work, and may be cut out of action.

Another point to which we must draw attention is the difference between mains used to carry

FIG. 35.

currents to distributing centres, and those used for distributing electricity. In the former case the general method is to decide upon a certain number of centres of distribution at comparatively short distances apart—as, for instance, at the junctions of main streets, and by connecting

these nodes or centres together so as to enclose a certain area, we have a representation of a net or mesh, more or less regular. The whole of such a system of mains, together with the service-mains (supplying the consumers) connected with them, forms a distributing network. To feed such a network, the centres of distribution are connected to the generators by a series of special feeding mains which divide the current supplied, and are of sufficient section to carry the current required at the distributing centres. These feeding mains are termed "feeders," and by some French writers "artères" (arteries), which is a very significant and suggestive term. A simple network supplied by feeders is shown in Fig. 35, in which G S is the generating station, F the feeders, C the centres of distribution, D the distributing mains or distributors, and S M the service mains.

The function of a feeder is that of a carrier, and it is evident that they may be long or short to suit the circumstances, and as they are only used for the transmission of electrical energy, they are never tapped by distributors. It is also obvious that if the feeders for a network have been properly designed so that the drop in pressure in them shall be the same, then the centres of distribution will all be at the same potential. These points may thus be looked upon as secondary sources or centres of feeding maintained at a constant potential, distributing the current into the network. The pressure at these centres is maintained constant by regulating appliances at the generators. The section of the feeders is determined by considering the maximum current which traverse them and their length, so that the permissible drop in pressure is not exceeded.

The distributors distribute the current received from the feeders to the service mains, and are therefore tapped at all points where current is required. They vary in size and length according to circumstances, and in some cases do not form a network, but a series of radiating mains. Unlike feeders, the current carried by the distributors is not the same at all points.

(To be continued.)

WROUGHT-IRON AND STEEL IN CONSTRUCTIONAL WORK.—XXXII.

CONTINUING examples of the building up of elements:—Two illustrations of the use of gussets as broad supports are shown in Figs. 207 and 208. In each of these, A A are portions of

Fig. 209.

long lattice girders which rest at their ends upon columns. The principal arched ribs of a roof rest upon the same columns; but the intermediate ribs rest on these girders, A—three intermediate ribs on each girder. The bases or springings of

Fig. 210.

these girders are shown at B in these figures, starting in the direction of adjacent spans. The gussets C C are inserted underneath the springings, and their dimensions are proportional to the ribs B B.

Fig. 207.

Fig. 208.

Fig. 211.

Fig. 212.

Figs. 209, 210 show how cross girders and rail-girders in the roadway of a railway-bridge may be united to the main girders. A is one of the main longitudinal girders, B one of the cross girders, and C C rail-girders running parallel and intermediate with the main girders A. The rail-girders are short, placed directly under the rails longitudinally, to take the rolling load

FIG. 213.

FIG. 215

FIG. 214

between the cross girders. They are of various forms—single webbed and of the trough type—and are united to the cross girders by similar methods to those by which other girders are united at right angles. Trough girders are used instead of the type shown in the figures when the depth available is but small. To keep the bottom of a railway girder bridge dry, and to prevent leakage, floor-plates are laid over the girders and filled in with asphalt and ballast. Leakage at the sides is prevented by means of vertical fender-plates D, riveted along the edge by means of angle-irons.

One of a series of radial girders is shown in

girders, A, with deep girders, B, either at right angles or askew. A is supported by means of gusset-brackets, C, riveted to B. Girders A are bevelled off at top to clear the top flange and flange-angles of B. One of the flange-plates is made wider than the rest, to receive the wrought-iron buckle-plates which support the concrete floor.

A curious method of securing girders is shown in Fig. 213. It is one of the cross girders of the Loa Viaduct. These, instead of being riveted to the main girders, were carried on turned steel pins in holes drilled through web and packing-plates at A A. The pins were carried by steel

FIG. 216.

Fig. 211 attached to an annular girder, the whole ring running on live rollers for a swing-bridge. The small ends of the radial girders are riveted with straps to the centre pivot casting. In work of this kind every part is proportioned as nearly as practicable to the work it has to do. Thus, the radial girder is not only tapered, but it is jointed at *a*, the plate to the left being $\frac{1}{2}$ in., that to the right only $\frac{1}{4}$ in. thick. The circular girder is formed of three plates, as shown at the parts where the load is imposed, but dies away to two and one in intermediate positions.

Fig. 212 shows the union of shallow built-up

castings on saddles, which bridged the top booms of the main girders. The longitudinal rail-girders were riveted at one end, but were received in cast-iron supports at the other, to permit of expansion. The recesses B B receive the expansion ends, the rails going in C C above. The small figure to the right shows a fast and an expansion end.

Figs. 214, 215 illustrate a portion of a bridge which embodies several departures from usual practice, the principal being the building up of the main girders by means of twin girders and the carrying the cross girders through the main

girders, instead of carrying them upon the inside bottom flanges of the latter in the usual way. The twin girders A A which form a single main girder are composed of top and bottom booms, vertical struts, and diagonal ties. The ribs or webs *a a*, *b b* form portions of the vertical struts, and the inner ones, *b b*, are made one of the bonds of union between the twin girders by the wrapper-plates *c* riveted to both. The other connection

FIG. 217.

is that of the web *d* of the cross girder B, which is carried through the main girders A A, as indicated by the dotted line, the vertical webs *a a*, *b b* stopping short at the edge *e* of the cross girder to permit the web *d* to pass through; wrappers or covering plates *f* unite the webs of struts and cross girders. The girder also rests upon a plate, *g*, riveted to the bottom flange of the main girder. The vertical angle irons of the struts are also riveted through these webs. The method of bending of these angles irons over the longitudinal angles of the booms is also a variation from illustrations previously

FIG. 218.

given, in which the angles have been bent sharply, and is preferable in some cases, avoiding the making of an overlap and weld in the abrupt angle. Another detail relates to the union of the small longitudinal girders or stringers between the cross girders. These are shown at C. They are built of plate and angle, and the web-plate comes up above the main girder A to receive,

the flanges of the buckle-plates which carry the concrete roadway, and the covering asphalt. Earth-plates, D, of cast iron confine these materials sideways.

Fig. 216 illustrates the combination of several parts in a road-bridge with footways. It is a part section through the Clarence Bridge at Cardiff, already alluded to as having been built on the American pin-connected system, and is believed to be the largest swing-bridge erected in this country. The centre swinging span is 190ft. 8in. long by 40ft. wide, and is supported entirely on the central pin, both when closed and

open. The figure shows a section through the roadway and one footway, with the method of the connection between their girders and the main girders. The shape of the roadway main or cross girders is indicated by A, which represents one of these girders broken off at the centre of the bridge. One of the footway cantilever girders is shown at B, and a portion of one of the main or longitudinal girders at C. The bottom booms of C are above the level of the floor girders; but the side plates of the vertical struts *aa* are continued below the booms to receive the end flanges of the girders A and cantilevers B, and the riveting is carried through angles on a central diaphragm, *b*. A principal advantage of this mode of construction is that the open web bracings of the pin-connected trusses leave clear ways between roadway and footways, so that passengers may cross from one side to the other. There are five rows of longitudinal girders, D, connecting the cross girders, and these are stiffened with diagonal bracings, *c*, as seen to the right of the figure. These girders are covered with buckle-plates, concrete, and timber. They are supported at the ends by stools and riveted to the cross girders A, the diagonal bracings occupying intermediate positions. The buckle-plates E are riveted over girders, as shown in Figs. 216—218. The cantilevers B support the parapet and flooring.

A slight camber upwards is imparted to the trusses of bridges, in order to prevent the trusses from bending below the horizontal under heavy loading. A rule for the amount of camber is: Divide the span in feet by 50, though a less amount than this is often given. A bridge should not deflect more than half this amount under its heaviest load.

J. H.

PAINTS AND THEIR VAGARIES.

EVERY paint user knows that for a painted surface to be successfully accomplished, great care and attention have to be exercised in the selection of one of the materials used. It is pretty generally acknowledged that when a man has failed at any other trade he can wield the brush as a painter. This wielding of the brush is a very simple matter of manual labour only—one which requires but little skill, and capable of being performed by any one of average ability. But it is not everybody who wields a brush that can or does understand the nature and vagaries of the paint he is using. The conditions of use are so diverse that it is only the skilled craftsman—the man who has been a painter by trade all his life—who can give a rational explanation of any defects in a painted surface. What causes blisters in paint? What causes the colours to sink in? What causes paint to remain soft underneath while the exterior surface is bone-dry and fairly hard? What, in fact, causes any and all of the “deviltree” a painted surface exhibits six months after the paint has been laid on? The jobbing hand, the nondescript sort of fellow, who has tried every trade and failed at all, cannot tell his employer why the paint he has laid on exhibits the above mentioned, or any other defect. It is only the “old hand,” the skilled workman, who can offer an explanation. But even with him the explanation offered is not always the correct one. It requires the aid of the chemist as well as the craftsman to interpret all the reactive changes that a coat of paint undergoes. It is the writer's purpose, therefore, to explain the nature, qualities, reactive changes that occur in the paint-pot and the coat of paint laid on the surface of any material. In the present paper the question of the

SINKING-IN OF COLOURS

will be considered. Before doing so, however, it will be best to explain the actual composition of this compound called “paint.”

Essentially a paint is composed of linseed-oil, pigment, driers, and turps. The oil used is generally boiled-oil—that is, the raw linseed-oil has been subjected to a particular treatment whereby it loses its raw or native qualities, and becomes converted into a different body in many of its characteristics. The boiling process consists in heating the raw oil to a temperature of over 500° Fahr., whereby a lot of water that is inherently present in the oil is expelled. The oil is then either oxidised by passing steam or air through it, or it is boiled with some sort of a mineral such as litharge (an oxide of lead), borate of manganese, calcium sulphate of zinc, or some other body which will

react on the fatty acids of the oil to oxidise them and thereby change the fluid from a limpid oil to a viscous varnish. (To illustrate the difference between an oil and varnish, drop a drop of each fluid on a piece of glass or porcelain, and note the difference in the drying power: the oil, if in the raw state, will remain fluid a very long time before it shows any signs of drying or hardening, and then it is only on its exterior surface that the drying occurs, forming a skin thereon; whereas, with the spot of varnish, that begins to dry and harden immediately it is exposed to the air.) Now, the object of boiling the oil has been to render the oil of a more drying nature—raw oil takes three months to dry when exposed to the air, but boiled oil does not take as many weeks. The pigment of a paint consists of a dry powder colour which imparts the tint to the paint; this is ground up in the oil vehicle, whereby each dry particle of paint becomes coated with a layer of drying oil, whence such mixtures, when spread out thinly on a surface, will dry to form a thin layer or coat of paint. If the mixture of pigment and oil is not sufficiently siccativ, the painter mixes in some “driers,” which enables the compound to dry at a quicker rate. The addition of turpentine to a paint is made so as to render the paint of a thinner or more fluid consistence, whereby the paint can be easily spread by means of a brush. These details are of necessity known to most painters; but this explanation is needed here, so as to render perfectly comprehensible what is to follow.

Now, apart from the chemical nature of the pigment used—whether it be a sulphide, oxide, chromate, silicate, carbonate, &c., of a metal—it will be noted, from the above, that the nature of the “driers” mixed with the paint has also to be reckoned with, and, lastly, the mixture of the turpentine. Consequently a “pot of paint,” or “coat” of ditto, is not a simple compound. Quite the opposite, in fact; for, although the oil of turpentine used is always of the same nature, putting out of consideration for the moment the idea of adulteration or substitutes, the chemical composition of the pigment is not always the same; neither is the drier always the same. We shall have occasion to consider these points in other articles. At present we will confine attention to the loss of brightness, or “sinking in,” as it is called, of colours.

Let us consider the nature of a coat of paint. It consists of pigment, an oil-varnish (i.e., the boiled oil), drier, and turps. When this layer is exposed to the air (that is, when the painter has ceased spreading it with his brush) the oil vehicle begins to become decomposed, whereby it is separated with its components, oleic, palmitic, &c., acids, and at the same time the base of glycerine, to which these components are attached in the undecomposed oil, is eliminated. As these chemical changes occur, the atmospheric oxygen seizes on the olein, and converts it into linolein, which is a solid, tough, elastic transparent body. The other fatty parts of the oil are more or less absorbed by the pigments, or else they are pushed to the surface of the coat of paint (as will be explained *infra*). The glycerine, however, does not become absorbed.

As the exterior surface of the coat of paint becomes oxidised as above explained, the particles of solid linolein sink to the undermost parts of the coat of paint, and thus a fresh layer of the oil vehicle is pushed up to the exterior surface of the coat of paint, to be similarly converted by the atmospheric oxygen into solid linolein. When all the oil has become thus converted, we can conceive that as each particle of solid linolein sank down, the particle of pigment was left denuded of a pellicle, or covering of oil. Also, we can conceive that the interstices between the particles of solid linolein and those of the pigment become filled with air, and also with the glycerine that has been eliminated from the oil by the decomposition it has undergone.

Now, glycerine is a greedy absorber of moisture, and, as a consequence, side by side with the transparent shining particles of solid linolein there are particles of water or moisture. We can now conceive the coat of paint to be in this condition. First, there is most of the oil next to the surface on which the paint is laid; above this we can conceive its pigmentary particles almost uncovered with oil, and side by side, or permeating the mass, is a quantity of aqueous particles. Now, the colour of the pigment is, of course, dull or bereft of sparkling brilliancy, and it is the object, or should be, of the oil vehicles to clothe each particle of pigment with a layer of shining oil.

This, however, is not the case for the conception above foreshadowed. Now, when all the oil has become converted into solid transparent linolein, this linolein will rise to the surface if it has not become too hard and solid (that is, if it has been quickly formed); but as it rises above the pigment particles they sink down, and becoming mixed with the glycerine and the water it has imbibed, we have a layer of transparent linolein above a layer of pigment, glycerine, and water. Now, the oxidation of this linolein still proceeds, and will proceed until it is of a uniform tough skin. To enable it to do so its absorption of oxygen proceeds, and as this oxygen unites the layer of glycerine and water that is imprisoned by the superimposed skin of linolein, the glycerine becomes oxidised to a glyceride, and which more or less permeates the skin of linolein, and thereby causes the latter to lose its transparency and become opaque; consequently the surface of the coat of paint is bereft of brilliancy, and exhibits a dull appearance.

It will naturally occur to the thoughtful reader that what is wanted to prevent this sinking in of the pigment is either the incorporation of some solid transparent body that will not allow the solid pigment to sink through the oil, or else some process or material that will quickly convert the oil vehicle into solid transparent linolein, for if the oil be converted into this substance before the pigment has had time to settle away from it, the linolein as it dries will inclose the particles of pigment in it, and slowly form a transparent layer of linolein round each particle of pigment (the glycerine that has been eliminated would in this case be driven to beneath the pigment and linolein, with what effect we shall see in a future article). Now, if a resin be incorporated with the oil, or a varnish be used as the binding vehicle for grinding up the pigment in, then the colours will not sink in, because side by side with each particle of solid opaque pigment there would be a particle of solid transparent resin which would reflect the light, and consequently cause the coat of paint to exhibit a brilliant appearance. Paint grinders, therefore, should grind up their pigment in an oleo-resinous vehicle. There is an additional reason why such a vehicle should be used, because a resin will absorb glycerine, and thus, instead of fluid glycerine and water being beneath a coat of paint, which is often the cause of blistering and peeling off of paint, the coat of paint would be one solid homogeneous mass from exterior to the undermost surface.

H. STANDAGE.

THE LUNATIC PAVILION FOR THE LEWISHAM BOARD OF GUARDIANS.

THIS building is now being erected on land adjoining the infirmary in the High-street, Lewisham. The exterior is of red and yellow stocks with Douling stone sills, heads, and copings. The floors of wards are to be laid with wood-block flooring and those of the offices with tiles. The walls and ceilings generally are to be plastered with “Adamant” plaster. Specially designed and glazed skirtings are to be used throughout, and the offices are to be lined with glazed bricks to a height of 7 ft. The case-ments and hoppers are to be of iron, those for the wards being specially designed. The heating is partially by the hot-air and by the hot-water systems. Mr. Robert Williams, F.R.I.B.A., of Lee, S.E., is the architect; Mr. T. I. Burden, of Maidstone is the builder, and Mr. I. R. Williams is the clerk of the works.

Mr. Frederick Dale Banister, late chief engineer to the London, Brighton, and South Coast Railway, died at his residence at Forest Row, Sussex, late on Wednesday evening in last week. He had been in the service of the company fifty years, and succeeded Mr. Hood, now a director, more than thirty years ago as chief engineer, a post he resigned in February, 1896.

At a meeting of the parishioners of St. Cuthbert's, Southport, the rector announced that, on the advice of experts and the Ecclesiastical Commissioners, it had been resolved to pull down St. Simon and St. Jude's Mission Church, opened four years ago at a cost of £6,000. The reason for this step was the settlement in the foundations through the sandy soil, which could not be remedied except at great cost, and even then the appearance would be unsatisfactory, and the risk not entirely eliminated. He also announced the gift of a large iron church by an anonymous donor.

Lunatic Pavilion for the Lewisham Board of Guardians.

Elevation.

Ground Plan.

BOOKS RECEIVED.

House Drainage Manual, by W. M. SPINKS, Assoc. M. Inst. C.E., Mem. San. Inst., &c. (London: Biggs and Co., Salisbury-court, Fleet-street). The author of this manual treats more fully of the designing and apparatus connected with the entrant end of a drainage system, and, from a casual glance of the chapters, twenty in all, the sections discussing requirements, planning of drains for different kinds of buildings, and subsoil drainage are of value. In the chapter on planning the author illustrates by plans several town blocks, a town court with backyards, others without yards, cottage property to conform to model by-laws, the blocks of cottages having through passages 10ft. wide between. The main lines of drain are laid on the passages, the house-drains each separately connected therewith. By this means legal difficulties and trouble are avoided, as, for example, when the drain from one house is connected to that of the other in the adjoining yard, each being owned by different persons. When a stoppage of one takes place, the adjoining owner may object. In the plan given, the Northern system is shown of making the drains pass through the closets. Another plan for semi-detached houses shows the position of each drain, manholes, wastes, soil-pipes, intercepting-chambers, and air inlets, &c. Other arrangements for a town house, a detached house, and a block are shown. Some useful remarks are made about the surface and subsoil drainage of hillside houses, and the means taken to keep them dry, such as a gutter or drain to carry away the surface or subsoil water. The remarks on drains, inclination of pipes, jointing, disconnection, intercepting traps, and manholes are up to date, and are fully illustrated. The chapters on the law relating to drainage add much to the usefulness of Mr. Spinks' manual.—*Electric Light: Its Production and Use*, by JOHN URQUHART, Electrician, &c. Numerous illustrations. Sixth Edition. (London: Crosby Lockwood and Son.) The rapid development of the art of electric lighting has rendered a new edition of this handbook necessary. The author has now added a chapter on "Electricity in Mining," and the regulations issued by the L.C.C. for the electric lighting of theatres have been included.—*The Local Distribution of Electric Power in Workshops*, by ERNEST KILBURN SCOTT, A.I.E.E. (London: Biggs and Co., Salisbury-court, Fleet-street, E.C.)—This little book deals with the application of electric motors to power work in factories. It is a compilation of facts and data that will be found useful to engineers and proprietors of factories. The author shows that the electric power is a commercial success, and that it can be transmitted to isolated points comparatively near together as well as to long distances. Mr. Scott lays down certain advantages of electric transmission to factories and workshops, such as absolute control over the machines, owing to the self-indicating nature of electric motors, concentration of the generating plant in one central position, lighter construction of walls and roofs, less cost of repairs, lubrication, and maintenance, less periodic vibrations than with steam-engine, and less wear and tear, saving of belts and cables. The author points out in detail many of the advantages of electric driving, and gives examples, the horse-power required to drive various machine tools, vertical motors, wood working, woollen-mill, and flax-mill machinery, and these types of machines are illustrated by photos. The tables and data will be found of value by the factory engineer and owner. Part III. is a useful summary of a power installation, with recent examples.—*Practical Forestry*, by CHARLES E. CURTIS, F.S.I., &c., second edition, revised (London: Crosby Lockwood and Son), is the substance in book form of a series of articles which appeared in the *Land Agents' Record*. The author's wish is to encourage the study of forestry among landowners, land agents, and the occupiers of land—a very laudatory object. No one will deny that the subject of tree-planting has been much neglected. Many large districts in this country remain unoccupied or only partially cultivated, much to the loss of future generations. A perusal of Mr. Curtis's little volume will be found of value to all landowners and their agents. The principles of forestry are now taught in all agricultural colleges, the Surveyors' Institution offers a special certificate to those who show a certain degree of knowledge in it, and portions of the Crown forests are set apart as models to follow. The author deals with the objects to be attained by planting, such as shelter

from winds, the amelioration of climate, the improvement of scenery, and to plant for profit. These objects are discussed. Probably to plant for profit has been the main incentive, though this may be so directed as to realise the other advantages. On building estates the value of well-devised planting is immense; but how often it is neglected! What, indeed, gives greater value to building plots than the presence of trees? They increase the market value of estates, and attract purchasers and tenants if sufficient timber is left standing. The chapters on soil and site, laying-out for plantation, preparation of ground, drainage, planting trees, thinning plantations, pruning, sale, measurement of timber, cost of planting, &c., contain many useful suggestions.

—*The "Practical Engineer" Pocket Book for 1898* (Manchester: Technical Publishing Company, Ltd.) is a new and revised edition of a well-known practical pocket-book and diary. Additions have been made to the section of the steam-boiler, engine, and electric matters, which latter are fully dealt with. The tables are full and complete. To the practical engineer engaged in steam-engine and mechanical work the book will be found of every-day service. There is a good diary, ruled in squares, at the end, the diagrams are clear and render the book a *multum in parvo* of mechanical data.—*The Engineering Magazine* (London: 222, Strand) for October has some interesting articles on "Electric Power for Trunk Railways," by Professor George Forbes; "Modern Wharf Improvements," by Foster Crowell (illustrated by photo-blocks); "Rapid Electric Travel," by Charles Henry Davis and F. S. Williamson; "Machine Shop and Foundry," by Henry Roland; "Industrial Awakening of Russia," by F. J. Guyon; "Progress of the Rack Railway," illustrated by E. L. Carshell; also illustrated articles on turret-ships, and "Notes on Civil and Mechanical Engineering," &c.—*Painting and Decorating*, by WALTER PEARCE (London: Chas. Griffin and Co., Ltd.)—This volume treats the subject of painting in a commercial and practical manner, and does not enter into the higher branches. The author is a practical house-painter and decorator, and lecturer on the subject at the Manchester Technical School for House-Painting and Decorating, and has brought together notes of processes and combinations of colours that have come under his notice that may be found useful for technological classes on the subject. A large portion of the book is devoted to workshop requirements, colours, driers, oils, tools, brushes, and other plant. Painting materials, like brushes, occupy a large space of the book, and are intermixed with patterns for wall and wood decoration, and plates in colours illustrating polychromatic, complementary, and other colour schemes. These designs and colour schemes we cannot admire—they rather detract from the value of the treatise. Some of the designs for colour decoration, as Plate II., illustrating a complementary scheme, are crude. The orange or monochrome treatment, and the "analogous" scheme are also displeasing. With these exceptions, Mr. Pearce's book will be found generally useful to practical painters and decorators. There are many valuable hints and suggestions on the technical processes, hints on damp walls, duresco and distemper painting, new woodwork, on stucco and cement, staining and varnishing, wall hangings, Lincrusta Walton, and other fabrics. As a practical handbook for the student and house painter, we can recommend the work.—*A Short History of Hampton Court*, by ERNEST LAW, B.A. (London: Bell and Son, 7s. 6d.), is condensed from the author's larger works, and it is for the most part a readable popular manual of the well-known palace, and contains little of special interest to architects or archaeologists. It is very readable, and the illustrations are numerous.—*Hints to Young Valuers*, by RICHARD ANTHONY CRAGG, F.G.S.; with Explanations of the Legal Principles Involved, by J. R. V. MARCHANT, M.A. (London: Land Agents' Record, Limited), is the republication of a very useful series of articles in the *Land Agents' Record*. The manner in which the legal part is incorporated with the practical part, and the numerous examples of valuations given, will render it valuable, especially to young surveyors and valuers.

Among the new members returned to the City Court of Common Council is Mr. Tom F. Rider, the well-known builder, and for many years a member of the Metropolitan Board of Works.

ALMANACS AND DIARIES.

AMONG the most really useful of general diaries the Folio diary, half-bound, at four shillings, and the shilling Quarto and Octavo diaries, interleaved with blotting, sent us by Messrs. Partridge and Cooper, are good value. The "City Diary" (London: W. H. and L. Collingridge) is useful, and in many respects, unique. The Rugby Portland Cement Company's noble Wall Calendar for 1898 is as effective as the speciality whose manufacture it illustrates is dependable. Waterlow Bros. and Layton's, Limited, Architects' and Surveyors' Diary (3s. 6d.) is of business-like proportions, and contains several useful features not to be found elsewhere.

Messrs. Hudson and Kearns send us their always welcome Architects' and Builders' Diaries and Desk Remembrancers. We have used these now for 23 years, during which period many additions and improvements have contributed to the achievement of a degree of convenience that is, we sincerely believe, as near perfection as anything human can be. For comprehensiveness of information, convenience of size, quality of material used, and intelligent provision for every conceivable need of the architectural profession and the building trades, Messrs. Hudson and Kearns' diaries have no compeer.

CHIPS.

But little business was transacted at the Mart, Tokenhouse-yard, during last week, which closed the year's business at this centre. Properties of various classes were offered on three days, the total sales amounting to £14,025. In the provinces the chief sale was that of the Histon Manor Estate, near Cambridge, which, submitted in lots, realised £11,170.

At St. Chad's Haggerston, the Bishop of Stepney has dedicated an eagle lectern which has been given to the church in memorial of the long and prosperous reign of Queen Victoria. It has been executed from designs by Mr. James Brooks, the architect of the church.

A fire occurred on Wednesday night at the saw-mills, Oval-road, East Croydon, belonging to Mr. J. Horrocks, a builder and contractor. Seven shops, machinery, and stacks of timber were destroyed. The damage is estimated at about £3,000.

A brass, designed by the late Mr. J. L. Pearson, R.A., has just been placed in St. George's Chapel, Windsor Castle, to the memory of the late Rev. the Hon. Charles Leslie Courtenay, who was for many years vicar of Bovey Tracey, and also Canon of Windsor.

The annual meeting of the British Institute of Certified Carpenters was held last week at Carpenters' Hall, London Wall. Mr. Harry Turville, who presided, was elected the vice-president for the coming year, and the hon. secretary, Mr. T. M. G. Lloyd, was also re-elected.

In celebration of the completion of the restoration of the historic church of St. Bartholomew the Great, West Smithfield, the executive committee are about to present an illuminated address to the architect, Mr. Aston Webb.

Mr. Herbert H. Law, an inspector of the Local Government Board, conducted an inquiry on Friday into the application of the Otley Urban District Council for sanction to borrow £4,000 for additional sewage works at Otley. Mr. Holt (engineer) stated that they were providing tanks with an additional capacity of 213,214 gal., the necessity for which was mainly brought about by the great quantity of trade effluent to be taken into the sewers from the Wharfe-side Paper Mill.

In order to meet the need created by an increase of insanity in the West Riding of late years, the Asylums Committee of the West Riding County Council are making preparations for the erection of an additional asylum capable of accommodating about 2,000 patients.

A disastrous fire occurred at Weston-super-Mare on Monday evening, at the sea end of the pier connecting the mainland with Birnbeck Island, on which the pavilion refreshment-rooms and concert-hall are erected. The fire appears to have originated in a bedroom of the pavilion through the overturning of a paraffin lamp. The damage is estimated at £4,000. The property is insured.

Plans have been prepared for the renovation of Queen Anne United Presbyterian Church, Dunfermline, at a cost of £3,000. The church is to be practically gutted from floor to ceiling. The pews are to give place to modern seats, and the gallery is to be so reconstructed as to form a semi-circle. The pulpit is to be removed, and behind its site a pipe-organ is to be built. Improved methods of heating and ventilation are also to be introduced.

THE THREE PATRON SAINTS OF GREAT BRITAIN AND IRELAND.—EXAMPLES OF THE ECCLESIASTICAL ARCHITECTURE OF SCOTLAND.—KINCARDINE HOUSE, DEESIDE, N.B.—KING JAMES'S GRAMMAR SCHOOL, KNARESBOROUGH.—HOUSES, THE AVENUE, LINCOLN.—LUNATIC PAVILION FOR LEWISHAM BOARD OF GUARDIANS.—LEIGH SAVINGS BANK COMPETITION: SECOND PREMIATED DESIGN.

Our Illustrations.

THE THREE PATRON SAINTS OF GREAT BRITAIN AND IRELAND, CHURCH HALL, PUTNEY.

THESE mural paintings have been executed this year in oil, and are treated in a decorative manner, with strict regard to emblematic detail. They were designed and painted by Mr. Fred Roe, of Victoria-grove, Chelsea, for the Church Hall, Putney, a building erected at the cost of Mr. J. W. Lancaster, from the designs of Messrs. Lee and Pain, architects, Lincoln's Inn Fields. The figures measure 8ft. 6in. high, and occupy a space of about 4ft. 6in. wide each.—St. Patrick, St. George, and St. Andrew.

ECCLESIASTICAL ARCHITECTURE OF SCOTLAND.

(See article and further sketches on page 932.)

KINCARDINE HOUSE, DEESIDE, N.B.

THIS house was finished about a year ago; it stands in a very fine position, commanding splendid views up and down the Dee Valley, Aberdeenshire. The walls are rough-cast with granite dressings, the roof being slated with green slates. The interior, of which the hall is shown, is finished simply but substantially in oak. Messrs. Niven and Wigglesworth are the architects. The second drawing herewith reproduced was shown at the Royal Academy this year.

DESIGN FOR PROPOSED GRAMMAR SCHOOL AT KNARESBOROUGH.

THIS design was submitted in competition by Messrs. Hall, Cooper, and Davis, architects. Provision is made for 20 boarders and 80 day-scholars at a total estimated cost of £3,153 2s. 10d. The materials it was proposed to use were Ruabon bricks, with stone dressings to walls and red tiles to roof. The drawing illustrated was hung in this year's exhibition at the Royal Academy.

HOUSES, THE AVENUE, LINCOLN.

THESE houses have been erected for Mr. G. W. Henton, ironmonger, the larger one for his own occupation. In addition to the accommodation shown there is a basement under the whole, containing washhouses, larders, servants' w.c.'s, and cellars for coals, beer, and wine; there are also bedrooms and boxrooms in the roof. The walls are built of local red bricks, the doorways, window sills, &c., being of red terracotta and the roofs are covered with Penrhyn slates. The general contractor was Mr. G. F. Harrison, the plumbing and glazing was done by Mr. J. H. Green, and the painting by Messrs. Waller and Mead, all of Lincoln. The work was carried out under the superintendence of the architect, Mr. J. H. Cooper, of Lincoln. The total cost was about £1,800.

COMPETITIONS.

BIRKENHEAD.—In a recent limited competition the plans submitted by Mr. T. W. Cubbon, architect, of Birkenhead, have been placed first by a professional assessor for new Unitarian school buildings to be erected in Bessborough-road. The scheme includes a church and other buildings.

LEWISHAM.—In the competition for free library buildings, the public libraries committee of the Lewisham Vestry have appointed Mr. Edward W. Mountford, F.R.I.B.A., 17, Buckingham-street, Strand, W.C., as assessor.

NEWARK-ON-TRENT.—In the competition for a school of art and technical buildings for the borough of Newark, the assessor, Mr. Ernest George, has just made his award. The first premium of £50 is taken by Messrs. C. E. Mallows and Grocock, of London and Bedford, who will be intrusted with the work; the second premium of £25 by Messrs. T. B. Silcock and Reay, of Bath.

NOTTINGHAM.—In the competition for a new cemetery at Basford, instituted by the Nottingham Corporation, Mr. Aston Webb has been appointed assessor for the buildings, including chapels, crematorium, and lodges, and Mr. H. E. Milner will help in the adjudication of the premiums on schemes for laying out the grounds. Twenty sets of drawings have been sent in. The premiums offered were £100 and £50.

CHIPS.

An oak altar-rail, supported on six brass standards, has been erected in the parish church of Long Sutton, from a design by the Messrs. Bassett-Smith, architects, Adelphi.

The oil-painting of Lord Russell of Killowen, in his robes as Lord Chief Justice of England, which has been subscribed for by the inhabitants of Hackney, as a testimonial to his long connection with the borough, will be unveiled at the Hackney Town Hall on February 10. Earl Spencer will preside.

Mr. David Richards, the well-known sculptor, who died recently at Utica, United States of America, was a native of Abergynolwyn, Merionethshire, where he was born 68 years ago. He spent the years of his youth up to his 24th year as a farm labourer. He had a taste when a boy for making models of clay and plaster, and he displayed, after emigrating to America, such skill in that direction that he decided to study sculpture.

Colonel Marsh, R.E., Local Government Board inspector, held an inquiry at Portsmouth on Tuesday in respect to an application to borrow £21,000 for electric lighting purposes.

Mr. James Freret, an architect of New Orleans, who had designed many of the prominent buildings in that city, died on December 11.

Colonel A. J. Hepper, Inspector for the Local Government Board, held an inquiry on Dec. 23rd at the Shipley District Council offices, as to an application to borrow £2,500 for the purposes of waterworks.

The church of Holy Nativity, Knowle, Bristol, has just received the addition of a stained-glass window, one of the lights in the north side having been filled in on Friday last. The subject is the visit of the shepherds to the manger at Bethlehem.

The Burslem School Board have adopted the plans of Messrs Wood and Hutchins, of Burslem, for a school accommodating 500 children, at an estimated cost of £6 per head.

There is reason for hoping that arrangements will be made whereby a costly fight between Rochdale and Todmorden on the waterworks question will be avoided. Negotiations are now in progress on the proposal that Rochdale should acquire the whole of the undertaking of the Waterworks Company, and should supply Todmorden until such time (five or six years hence) as the corporation of that town is able to complete a reservoir.

Mr. Robert H. Bicknell, an Inspector under the Local Government Board, held an inquiry at Harpenden, Herts, on the 23rd inst., into the application by the Harpenden Parish Council to borrow £400 for the provision of buildings for public offices.

Mrs. Edis, the wife of Colonel Robert W. Edis, J.P., F.S.A., died, we regret to hear, on the 22nd inst. at the Old Hall, Great Ormesby, Norfolk.

Last week the last horse-tramcar was taken off the streets of Buda-Pesth. The whole of the tramway lines have been converted into electric lines for a length of seventy English miles, while the Buda-Pesth Underground Railway also has electric traction for a further distance of fifty-three miles.

Engineering Notes.

NEW CROSS AND WATERLOO ELECTRIC RAILWAY.—A Bill to incorporate the New Cross and Waterloo Railway Company has been deposited in the Private Bill Office. The proposed company seek power to construct an underground electric railway commencing at a point in Old Kent-road near the bridge carrying the London, Brighton, and South Coast Railway over that road, and terminating under Waterloo-road near the point where the South-Eastern Railway crosses that thoroughfare. The capital proposed to be created by the company is given in the Bill at £975,000. The Bill contains provisions prohibiting the construction of ventilators, or other openings, in any road or footway, and also the exhibition of advertisements upon any part of the works. During the period of construction power is sought to pay interest out of capital to an amount not exceeding £80,000, and power is sought to enter into working agreements with the London and South-Western Railway, the Waterloo and City Railway, and the Baker-street and Waterloo Railway companies.

A NEW RAILWAY FOR BANBURY.—Operations have commenced in the construction of the Banbury branch of the Great Central Railway. The new line leaves the main line of the Great Central at Culworth, about nine miles from Banbury, at a point on Lord Valentia's Eydon estate. It passes through a rich grazing district, and one well known to the followers of the Bicester Hounds. With the exception of a long deep cutting between Thorpe Mandeville and Chacombe, the works are comparatively light. The steepest gradient is 1 in 132. The line will be a double one, and will join the Great Western Railway about a mile to the north of Banbury Station. The Act obtained for the construction of the line allowed for a capital of £200,000. The engineers are Sir Douglas Fox and Mr. Francis Fox, and Messrs. Walter Scott and Co., of Newcastle-on-Tyne, are the contractors.

The proposal to construct a light railway in the South of Lincolnshire, from Spalding, through the Marshes, to Sutton Bridge, has been abandoned for the present, owing to the lack of financial support locally.

An inquiry was held on the 23rd inst. by Colonel Durnford, representing the Local Government Board, into an application by the Stockport Corporation for permission to borrow £25,000 for the purposes of electric lighting. Mr. Shoolbred, of London, the engineer for the electric lighting scheme, gave particulars of the proposals.

The new parochial building at St. Mary's, Bearwood, was opened on Tuesday by the Bishop of Lichfield. The building, which is of brick, stands contiguous to the church, and comprises a hall with accommodation for 300 people, and two classrooms. The cost has been £1,815. The contract has been carried out by Messrs. Harley and Son, from the plans of Mr. J. H. Hawkes.

At the meeting of Bedale Rural District Council on Tuesday, an application was received from the Bedale Parish Council, asking the council to provide Bedale with a pure and efficient water supply. It was stated that a water supply could be obtained from Spring Wood at a cost of £2,850. It was decided that steps be taken to carry out the scheme submitted by Messrs. Fairbank and Son, of York, and that it be sent to the Local Government Board for approval.

Throughout 1897 great prosperity has attended the granite industry of Aberdeen. In spite of an enormous fall in the American export trade, the year has been one of, on the whole, uninterrupted briskness in both departments of the trade—building and monumental. In the building department especially the year has been one of remarkable prosperity. It follows of course, that all the allied industries have been prosperous as well—the joiner trade, plasterers, slaters, and painters.

Who will succeed Mr. Pearson as architect of Truro Cathedral and how he will be appointed are questions which, says the *Royal Cornwall Gazette*, now have to be considered. The designs and plans of Truro Cathedral, so far as they have been completed for the new work, will be in the hands of Mr. Pearson's executor, and provision may have been made for the disposition of them in the will of the architect. If they are to remain the property of his heirs or assigns, it is supposed that some joint arrangement will have to be made between the executors and the Cathedral Committee as to what architect shall be appointed to see them carried out.

Building Intelligence.

Bourne.—A number of alterations and extensions have just been carried out at Bourne College, near Birmingham. A new wing will afford increased accommodation. The cost of the extension, including the provision of a sanatorium, is £4,200. The college now is capable of accommodating over one hundred students. The main schoolroom, which is situated at the west end of the building, is surrounded with a dado of white glazed bricks. The classrooms and bathrooms are arranged on a similar plan. At the end of the north corridor is the science lecture-hall, adjoining which is a laboratory, fitted with benches, fume-chambers, and apparatus suitable for the illustration of practical chemistry and other scientific subjects. On either side of the corridors are rooms for musical recreation, and other purposes. These rooms are all on the ground floor. On the first floor are the dormitories, storerooms for clothing, linen, &c., together with apartments for students on special terms. There is also detached from the main buildings, and situate on the eastern side of the yard, a workshop fitted with benches and tools for practical instruction in carpentry, cabinet-work, machine and building construction, and other kinds of skilled labour. The total length of the frontage of the college is now 270 ft.

Clothworkers' Guild, London.—Acting under the instructions of the Clothworkers' Company, Mr. T. W. Cubbon, architect, of Birkenhead, is engaged upon an extensive scheme of educational buildings, &c., to be carried out in Peel, Isle of Man, in connection with Christian's Endowed Schools. The scheme will include new elementary school buildings, also schools for secondary education, including science and art departments, navigation, cookery, manual, and other technical classes. Three of the existing schools are also to be altered and extended, and probably a keeper's house erected for the whole of the schools.

Glasgow.—The formal opening of the new Refuse Despatch Works erected by Glasgow Corporation at Haghill, Parkhead, took place last week. The site extends to 15,192 square yards. Of that, 11,012 yards are occupied by the works, leaving 4,180 yards which can be utilised for feuing purposes. The cost of ground, buildings, machinery, and railways, and including the formation of a new street, amounts to about £2,000. Entering from the street by the north gateway, carts pass over an elevated roadway to the tipping floor, where are tanks, shoots, and rails for the separation of the refuse. The process of separating and mixing is carried out on this level. Domestic refuse and dry sweepings are screened in riddles, the finer matter passing into mixing machines with revolving blades, and falling direct into railway waggons underneath. The rougher material which cannot pass through the screen is forced by the motion of the riddle on to an endless carrier, which conveys it in the direction of the furnaces. While passing over the carrier all articles of value, such as iron, tin, and bones, are picked off and utilised to the best advantage. In the slop tanks is the residuum of soft sweepings from paved streets, which, when firm, is conveyed to railway waggons, and goes to enhance the quality of the prepared manure. This manure is largely used by agriculturists over a wide area of Scotland. There are five furnaces for the cremating process, each with a fire-grate area of 56 sq. ft. Steam is generated by the heat from the furnaces not only for driving the machinery for treating the refuse, but also for the lighting of the whole station by electricity. It is eighteen years since the corporation decided to have refuse works, and there are now four such works in the city. Their total cost has been £126,000. Additional works are contemplated in the north-western and south-eastern districts.

Islington-green.—Collins's Music-Hall at Islington-green, built 36 years ago, has been taken down, and in its place there has arisen a theatre, which was opened on Boxing Night. The building is on an enlarged scale, some adjoining property having been acquired for the purpose of extension, and the architect is Mr. E. A. Woodrow, A.R.I.B.A., formerly in the theatres branch of the London County Council. The Louis Quatorze style of decoration has been adopted for the auditorium, the prominent tints being old gold, blue, and terracotta, and the draperies are blue, and plush-covered seats in

old gold. The ground floor is divided into fau-teils, stalls, and pit-stalls, with tilt-up seats, and a pile carpet covers the floor, which is formed of wood blocks. The stage has been nearly doubled in size, and is fitted with tableaux and fireproof curtains. Hot-water radiators have been provided for making the auditorium and entrance-passages comfortable. There is seating accommodation for nearly 1,800, the gallery providing about one-third of this.

Knighton.—The restoration of the parish church has been completed, and the edifice was rededicated last week. In 1876 the nave was restored and reopened; subsequently a new vestry was added, but the building of a new chancel and organ-chamber was deferred till 1896, when the late Mr. J. L. Pearson, R.A., was appointed as architect, and his work has now been finished. The new building is Early English in style, being erected of native stone and Bath stone dressings, supported by buttresses. The windows are lancet, and the roof covered with Broseley tiles, the whole being in keeping with the other portion of the church. The dimensions of the interior are: chancel 37 ft. by 25 ft., and the organ-chamber 14 ft. by 12 ft. The walls are stuccoed, and the dressings are of Bath stone, while the floor is laid with warm-coloured encaustic tiles. The builders were Messrs. Cadwallader and Weale.

Manchester.—There has been a large amount of building in and around Manchester, says the local *Guardian*, during the year now closing. Warehouses and shops, to take the place of former structures of the kind which have been pulled down, have been erected in considerable numbers, and the tendency to employ iron wherever possible, and to a certain extent glass, has made further progress. The building of cottage property on a large scale has continued, but it has been less profitable to those engaged in it than could have been desired. There is a growing tendency towards specialism, observable in the letting and accepting of contracts, it being often customary to give one firm the brickwork only, another the carpentering, and a third the decorative work. Wages in the various industries concerned have undergone no noteworthy alteration; but among those employed in decoration, plasterers have often been in request and difficult to obtain. Cottages built to let at from 7s. to 8s. per week have been in the greatest request, and large numbers of them have been put up. The demand for bricks of the Ruabon type, which has for several years been active on account of the superiority of this material in withstanding the taint of a smoky atmosphere, has shown no sign of abatement; but the production of bricks of this class in other localities—notably in Accrington—has prevented any scarcity in the supply such as has been experienced in former periods.

Sheffield.—The Midland Railway Company have at last taken up in earnest a scheme for improving their station accommodation at Sheffield. The station is now inconveniently small to accommodate the present traffic. The company have decided to erect a new passenger station, which will absorb the present one, and to double the main line in the immediate neighbourhood. Plans have been prepared, and Parliament in the next session will be asked to sanction the carrying out of the scheme. It is hoped that that will be obtained by the middle of next year, and then the work will be entered upon at once. The new station is to have at least double the accommodation of the present structure. It is proposed to very considerably widen the main line for some distance on the south side, and for a less distance on the north side. This will involve a good deal of interference with streets converging on the station. The main entrance will be some 70 ft. or 80 ft. nearer the bottom of Howard-street, and the style will harmonise with the existing buildings. Inside the accommodation will consist of two long and wide island platforms for the convenience of through trains. There will be a home platform and dock platforms for the local traffic, north and south. Each of the island platforms is to have waiting-rooms, refreshment-rooms, and other conveniences. The company own the larger part of the land they require for the carrying out of their scheme; but with that advantage the cost, it is expected, will approach £200,000, and it will occupy two years in carrying through.

Stoke Newington.—The Alexandra Theatre and Opera House was opened on Boxing Night. It is situate in Stoke Newington-road, within a

few minutes' walk of the Dalston Station of the North London Railway. It is capable of holding no fewer than 3,000 persons—1,000 in the pit and 900 in the gallery. The stage is 50 ft. deep and 60 ft. wide, the proscenium being 30 ft. by 32 ft. Particular attention has been given to the pit, which is furnished with backed upholstered seats, and the walls of which have a dado of encaustic tiles. The chief frontage is of red brick with stone ornamentation, in the Italian style. The decorations are Elizabethan in character, the whole being finished in cream and gold, with a light copper-bronze ground. Mr. Frank Matcham is the architect.

Widnes.—The Mayor opened the new retort house at the Widnes Gasworks. The new retort house is a brick building, the outer walls being relieved with red sandstone facings. The inside dimensions are—length 90½ ft., width 62 ft., height from the ground-floor level to eaves 28 ft., and to apex of roof 44 ft. The carbonising plant consists of seven D-shaped retorts, 16 ft. by 20 ft., and 20 ft. through, making 112 mouthpieces, having a total gas-producing capacity of 60,000 cu. ft. per diem. The retorts are fitted with self-sealing lids, and are heated by improved regenerator furnaces, there being one furnace only to each through bed, as against two in the old system. It is intended during the coming year to erect mechanical coke-elevating plant to facilitate the storing and rapid loading of coke in large quantities. The whole of the work, when finally complete, will cost about £4,500, exclusive of the proposed elevating machinery. The total gas-producing capacity of the town is now about 1,600,000 cu. ft. per diem. The whole of the work has been carried out under the supervision of Mr. I. Carr, manager of the gasworks.

CHIPS.

The scheme which the directors of the London and North-Western Railway Company contemplate carrying out in regard to the enlarging of Lime-street Station, Liverpool, promises to be of an extensive character.

Cardiff is proposing, in connection with its new tramways scheme, to repave from kerb to kerb the streets to be traversed by the tramways, as well as some other thoroughfares, with Australian hardwood blocks at a cost of £261,000. This decision has been arrived at after a consideration of the results of experimental wood-paving already carried out in the town. The corporation will import the hardwood direct from the West Australian plantations, erect machinery for cutting up the timber into blocks, so saving the expense of middlemen.

One of the most destructive fires which has occurred in West Hartlepool for many years broke out on Thursday night in last week on the premises of the Cliff House Sawmills Company, Limited, at the south end of the town. Two large brick and iron buildings containing a great quantity of wood and joiner work, as well as the whole of the machinery and stock, were destroyed. The damage is estimated to exceed £10,000.

The position of engineer to the Liverpool Corporation, vacated by the retirement of Mr. Boulnois, is, says the *Liverpool Mercury*, one of the prizes in an important profession, and a large number of applications may be expected from all parts of the country. January 18 has been fixed as the final date for sending in applications. A commencing salary of £1,000 per annum is offered, and preference will be given to candidates between 30 and 45 years of age.

The arbitration to fix the price to be paid by the Bakewell Urban District Council for the purchase of the local gasworks will be held in London during the first fortnight in the New Year. Mr. Cripps, Q.C., M.P., will be the umpire. The arbitrators will be Mr. Newbiggin for the council and Mr. Stevenson for the company. The engineer for the council will be Mr. Corbett Woodhall, and the engineer for the company, Mr. Chester.

The Local Government Board have approved of the erection, by the Croydon Board of Guardians, of new casual wards at Thornton Heath, on the cell system, from the plans of their surveyor, Mr. F. West, of Croydon.

The urban district council for Tipton accepted, on Tuesday, the conveyance of a public park 25 acres in extent, which has been purchased by subscriptions as a memento of the Diamond Jubilee.

An inquiry was held by Colonel William Randall Slacke, R.E., Local Government Board inspector, at the Guildhall, Gloucester, on the 21st inst., as to applications made by the city council for sanction to borrow £6,750 for street improvement, £6,500 for technical instruction, £2,480 for sewerage, and £1,383 for an extension of the water supply.

LEIGH SAVINGS BANK COMPETITION

SECOND PREMIATED DESIGN

BY PERCY MONTAGU BEESLEY ARCHT

LEIGH SAVINGS BANK COMPETITION.

THE design by Mr. Percy Montagu Beesley, architect, illustrated to-day, is the one awarded the second premium by the managers and trustees of the Leigh Savings Bank. Eight architects submitted plans, and the sub-committee appointed to report on the several schemes placed this design first; but the managers and trustees did not adopt the sub-committee's report.

The Independent Methodists of Zion Chapel, Sussex-road, Southport, having rebuilt their chapel on a greatly improved plan, the new edifice was opened on Christmas Day. The schoolroom is partially sunk, and the chapel, which holds 300 persons, is placed above.

Bury St. Edmund's Town Council have resolved to apply to the Local Government Board for power to borrow £29,000 to carry out electric lighting.

A temperance hotel five stories in height and having frontages of 300ft. to Whitehall-crescent, South Minor-street, and Dock-street, is about to be built at Dundee, from plans by Mr. Robert Hunter, of that city. The chief front, that to Whitehall Crescent, will be occupied by shops.

The National Sunday League presented a memorial to the trustees of the National and Tate Galleries last October asking that, instead of being closed on Sundays from the middle of September, the galleries might in future be open to the public for a longer period of the year. The secretary of the League has now received a reply from the Keeper, stating that the director and trustees, having considered the proposal, are of opinion that it would not be worth while to keep either of the galleries open on Sunday afternoons during the winter months for the brief time in which the pictures could then be seen by daylight; but they think that the Sunday opening might with advantage be extended to the end of October annually. A recommendation to this effect has accordingly been made to, and approved by, the Treasury. A similar letter has been sent to Mr. Mark H. Judge in reply to a memorial from the Sunday Society.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

EDINBURGH ARCHITECTURAL SOCIETY.—The second annual dinner of the Edinburgh Architectural Society took place on Wednesday week in the Imperial Hotel, Market-street. Councillor Cameron, the hon. president, was in the chair, and the croupiers were Mr. W. N. Cumming, the vice-president, and Mr. J. F. Matthew, the hon. treasurer. After the loyal toasts, Bailie Mackenzie proposed "The Edinburgh Architectural Society." Speaking, he said, from a plain man's standpoint, he admitted that there were very fine buildings to be seen, with great detail on them; but he did not know that the public were sufficiently educated to appreciate such buildings. In the education of the professional architect he thought sometimes that there was a defect, in that the student did not study the kindred branches of the profession in regard to physics, chemistry, and electricity. Architects, he thought, lost sight of these in pursuit of what was purely architectural detail. For example, he believed that a little knowledge of electricity and of electric lighting would be of great service to young architects. Mr. Jas. A. Williamson, the president, responded for the society. The society, he said, had now been founded for two years. It consisted of junior members of the profession, and it had cut itself adrift, to some extent, from the older Association. Whether that policy was right or wrong it was not for him to say; but they felt that their own individuality was the very life of the society. There was a disposition on the part of the older association to take that, the younger society, under its wing, but, apart from questions of policy, they would not overlook the fact that so long as they had the funds to carry on the society, and had life and vigour, they were perhaps better to remain independent. Mr. Williamson afterwards proposed "The Corporation," and said that they, as architects, had reason to congratulate them-

selves that the members of the town council were very jealous of the amenities of the city. Bailie Pollard, in acknowledging the toast, said that the corporation were engaged in a great many matters that were purely architectural. For example, there was the rebuilding of the North Bridge-street, and he hoped, in that connection, that the town council would not be so far left to itself as to become the builder of the street. Then, again, the corporation had in hand the matter of the Usher Hall. He did not feel, as a member of the corporation, that they had very much credit in alluding to that question. He was sorry that the corporation had not been able with greater promptness to show their appreciation of the most handsome gift of Mr. Usher by finding a site for the hall before the present time. He hoped, however, that before very long a suitable site would be found, and that Mr. Usher would have the satisfaction of seeing the hall in use during his lifetime. Other toasts followed.

The salary of Mr. Stilgoe, the borough surveyor of Dover, has been raised by £100 per annum, the increase to commence from October last.

The Corporation Church of St. George, Liverpool, will be closed at the end of the present year, and service was held at the church on Sunday evening for the last time. It was built by the mayor and corporation on the site of the old Castle, under a special Act of Parliament, between 1726 and 1734.

The new viaduct which has been in course of erection for the North-Eastern Railway Company at Rely was opened recently. The old structure was a combination of wooden supports, situate round the termination of a bend in the line of rails and at the foot of a sharp gradient. The new viaduct is built mainly of brick, and spans the river Brownie in four arches. It has a double line of rails, and the gradients and levels have been improved. The contractor was Mr. Shanks, of Glasgow, and it has been constructed under the direction of Mr. C. E. Harrison, the engineer to the company.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 90c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—P. L. F.—G. T. L.—R. and P.—D. S. T.—A. and Co.—W. W.—G. D. N.—E. A. W.

Correspondence.

"A PARALLEL TO WALTHAMSTOW."

To the Editor of the BUILDING NEWS.

SIR,—Messrs. Spalding and Cross deny that they took part in the competition for the East Finchley Schools. I never suggested for a moment that they did. Then they contradict a statement which was made to us on two occasions, far apart, and for which I expressly disclaimed all responsibility. It proceeded from their own supporters, and its place of origin can be published should circumstances require it. In any case, its greater or less correctness does not affect the central facts of the case. Messrs. Spalding and Cross are now stepping into Mr. Dunford's place, after he has fairly gained the Walthamstow Baths competition. Messrs. Spalding and Cross stepped, in like manner, into our place, after my partner and I fairly gained the East Finchley Schools and Hall competition. They carried out our competition plan and arrangement; they got credit for them at East Finchley, and in the local newspaper, and the *Builder*; and now, with an assurance which reaches the sublime, they wind up by asking for an apology!

The East Finchley committee gave us the choice of remaining their architects if we abandoned our charges for the working-drawings they had ordered and approved—or of being dismissed if we claimed them. Doing the latter, our appointment was forthwith cancelled; but every atom of information beyond this was refused us. Silence and secrecy were the order of the day, and we heard nothing more till we learned that Messrs. Spalding and Cross were carrying out our competition plans.

They say that before they undertook the work, they were told it was definitely decided "not to intrust it to me," though it had long before been definitely intrusted to me, and though everything had been prepared for tendering. They say they ascertained, before "undertaking" the work, that our professional charges had been settled. If they had asked us, we could have told them a different story—unless their idea of a fair settlement is first to dismiss an architect because he will not work for nothing, and then to cut down to a fraction of the recognised amount what they cannot avoid paying him for. By the way, did Messrs. Spalding and Cross ascertain, before stepping into Mr. Dunford's place at Walthamstow, that he had been fairly compensated for the loss he was to sustain by their action?

I conclude this letter, like the previous one, by a challenge to Messrs. Spalding and Cross in the plainest terms in which I can put it. I say that they carried out at East Finchley, and in every essential point, our plans and arrangements (not our elevations). Our plan was made to fit a peculiar site, nearly triangular, and was not a mere stock arrangement which might suit half-a-dozen places. I say that Messrs. Spalding and Cross published their own names, or allowed them to be published, as those of the architects of this plan, and got all the credit for it which, according to the newspaper reports, it received. If they deny this, let them publish in the BUILDING NEWS the plans (ground floor and first floor) of the East Finchley building, as erected, and we will publish along with them the plans approved and issued by the committee and bearing our names. To evade this plain challenge on the plea that "the plans are, unfortunately, not now in their possession," will hardly suffice Messrs. Spalding and Cross in a journal which circulates amongst architects. In any case, East Finchley is within six miles of London, and if Messrs. Spalding and Cross still find insuperable difficulties in publishing the plan of the schools as they built them, perhaps you, Sir, as this is a matter of public interest, might be able to get the plans measured and drawn by a competent draughtsman. Whenever the plan of the school as built is set side by side with its plan as we designed it, your readers will see whether it is Messrs. Spalding and Cross, or I, who "do not hesitate to publish untrue statements in the attempt to injure other architects."—I am, &c.,

JAMES CURITT.

2, Broad-street Buildings, E.C.

[Perhaps that will be the best thing for us to do, if Messrs. Spalding and Cross cannot let us have their plan. The publication of the two plans side by side will be more to the purpose than any amount of mere talk.—Ed.]

SIR,—I should be glad to be allowed to express my sincere sympathy with Mr. Dunford at the very bad treatment he has been subjected to at the hands of Messrs. Spalding and Cross. I have good reasons for knowing enough of this matter to believe all the statements of the former, and I hope some more prominent member of the Institute than myself will see that the matter is properly brought before its council.

If the R.I.B.A. is to fulfil one of its chief functions, here is a good opportunity.—I am, &c., London, W.C. F.R.I.B.A.

CARDIFF MUNICIPAL BUILDINGS COMPETITION.

SIR,—I shall feel obliged if you will find space for the following notes on the "Selected Designs."

INSTRUCTIONS.

Page 4.—Designs will be excluded from the competition, if in violation of the instructions.

Page 4.—Ante - assembly room and reception hall.

Page 4.—It is suggested that the assembly-room, ante-room, and reception hall should be *en suite*.

Page 1.—Each set of buildings should as far as possible be designed so as to admit of extensions.

SELECTED DESIGN.

These two rooms are omitted: a landing takes their place, as at Manchester.

A corridor intervenes.

The bits tacked on the plans entirely block out the light of the rooms they adjoin.

INSTRUCTIONS.

Page 2.—This may necessitate an alteration in the course of the new road—at any rate, along the south or principal front.

Page 6.—Two workshops, well ventilated, and good light (ground floor).

Page 7.—Bar robing room with direct communication therefrom to the criminal and civil courts. In "Questions and Answers" a corridor may intervene.

Page 7.—Grand jury room to be in direct communication with the criminal court.

Page 7.—Ante-room common to magistrates and stipendiary, 20ft. by 16ft.

Page 7.—The town clerk's room is 215ft. from the mayor's parlour.

Page 7.—The ladies' and gentlemen's cloak-rooms are about 7ft. in height at the ends.

Page 7.—The bar library is 200ft. from the criminal court.

Page 7.—There is no lavatory for the barristers, grand jury, or nautical assessor.

Page 7.—The jurors' lavatory is placed in the middle of the judges' corridor.

Page 7.—The prisoners are brought into the police-courts through the public.

Page 7.—No large heating or ventilating shafts are shown on either plans.

Page 7.—The refreshment-room for courts has no servery.

—I am, &c., HUON A. MATEAR.
The Temple, Dale-street, Liverpool, Dec. 28.

TIMBER.

SIR,—My attention has been called to D. Forbes Smith's questions under this heading, which appeared in your columns on Dec. 10. There is no difference in the wood variably called red and yellow deal; but in the trade there is a vast difference if you allude to it as red and yellow pine.

Red or yellow deal is a very ancient term, deal itself implying a converted piece of wood or portion of a tree, as a "deal of cards" is a portion of a pack of cards. The old-time designation of the tree producing it was fir, as we still have it in our Scotch fir. One reason of the dual term red and yellow is that the merchants and consumers receiving this wood from the Baltic districts, in London and the South called it yellow to distinguish it from the whitewood, which latter must evidently have been drawn at an early period from Prussia, for it was called "pruce-wood," and is now our Baltic spruce or white-wood. The merchants or woodmongers of Hull and the North, little knowing what was doing in such distant places as London and the South, called this imported fir-wood red deal, to distinguish it from the white deal, and the reason why yellow deal almost exclusively obtains in the textbooks is that they happen to be published in London and to be the work of London editors.

Botanically, the tree producing this wood is a pine, generally designated *Pinus sylvestris*, but in the trade you cannot, without creating confusion, allude to it by that name. Fir is the popular name; but, except in Sweden and Denmark, it is not the generic name, the rest of Europe classing it as a species of the genus *Pinus*.

A carpenter or joiner working on yellow or red deal is not supposed to know that such wood is the produce of a tree classed by botanists as a pine, and it is the importing of this term by the learned of to-day, who wish to be precise, that creates the confusion D. Forbes Smith alludes to.

It is quite true that the joiner will describe his converted wood *deal*, and that the carpenter will describe his balk timber, or possibly his sawn wood, *fir*. Balk timber has ever come to hand under its foreign designation of *fir*, or, as it is recorded in the Scandinavian language, *furn*. Log timber could not, by the old *wrights* or workers in wood, be called *deal*, because it was not in what they understood as deal sizes, therefore the foreign term, common on our foreign invoices and bills of lading to-day, took root with us; but their *grau*, for our white wood, never did.

D. Forbes Smith's suggestion of wiping out these old terms or landmarks is Utopian. If he

were to agitate his reform of "Northern pine" for the remainder of his days, I do not think he could advance it one inch. The confusion he complains of is part of our language; an inheritance of the past, and it cannot be set aside.

I am asked by a private correspondent my opinion on the following points:—

1. Was not the *Pinus sylvestris* originally classed as a *fir* (or, at any rate, the first imports of it from the Baltic ports), but now by botanists referred to the genus *Pinus*? 2. Is not the red of timber exporters and importers and timber merchants derived from the colour of the bark (same as black spruce of America from its black bark)?

In reply to No. 1, I may say the *Pinus sylvestris* has never to my knowledge been botanically classed as the *fir* in this country. Commercially, but not botanically, it certainly was so rated, as, indeed, in the balk state it is to-day. This means that it has never been referred to, but has always stood as a species of the genus *Pinus*.

In reply to No. 2, I am of opinion that the imported wood, whether in the deal or balk state, obtained its name (in the North) from its colour, and that some such title was necessary to distinguish it from the white-wood emanating from the same source. With few exceptions, the men handling imported woods are strangers to botanists and all their ways. We have to bear in mind that red and white woods, imported in the North of this country, came to hand for centuries before those sending them ever knew or cared what species of tree produced them. The same remark applies to the men of the South, who elected to designate the two woods *yellow* and *white*. If the terms were drawn from the colour of the bark of the trees in a living or unconverted state, how are we to account for the adoption of the term *yellow* in the South?—I am, &c., WILLIAM STEVENSON.

City Saw-mills, Hull.

CHIPS.

A sale has recently been effected by Mr. William Houghton, of Old Broad-street, of a house at Walthamstow and about $\frac{3}{4}$ acres of freehold building land at £6,000, being at the rate of upwards of £1,700 per acre.

The promoters of the Tanad Valley Railway from Oswestry to Llangynog have received an intimation from the Lords of the Treasury that they are prepared to make a special free grant of £18,000 in aid of the line. This is the first grant which has been made under the Act.

Messrs. John T. Wimperis and William H. Arber, of 25, Sackville-street, Piccadilly, the well-known architects, inform us that the partnership hitherto subsisting between them has been dissolved as from the 1st day of June last by mutual consent, and that Mr. W. H. Arber of the late firm will continue to carry on the business at the above address under the style of J. T. Wimperis and Arber, as heretofore, he having purchased Mr. Wimperis's interest in the same.

The commissioners of the Caisse de la Dette have placed at the disposal of the Ministry of Public Works a sum of £E684,000, to be expended as follows:—£E154,000 for the execution of new drainage projects in Lower Egypt during the year 1898, and £E530,000 to be devoted to the construction of two subsidiary weirs below the existing barrage, one in the Rosetta and one in the Damietta branch of the Nile. The object of these weirs is to diminish the difference in the summer water levels of the barrage, and they will relieve the severe strain thrown upon the structure. These weirs will be begun next year and finished in 1901.

A Bill for incorporating the City and Brixton Railway Company, and for empowering them to construct an underground railway from the City and South London Railway to Brixton-hill, has been deposited at the Private Bill Office. The proposed railway, which will be nearly $\frac{3}{4}$ miles in length, will start by a junction with the City and South London line under the High-street, Borough, and will terminate under Brixton-hill. It is proposed to widen the City and South London line near London Bridge Station, and also to construct a subway connecting with the Kennington Oval Station on that line, down to which point from St. George's Church, Borough, the new subway will be parallel with, but of greater diameter than, the existing one. The capital required by the proposed company is £1,200,000. The Bill also seeks power to enable the company to acquire by purchase or lease so much of the existing City and South London Railway as lies between their proposed point of junction in the Borough and King William-street in the City. The time sought for the completion of the works is five years.

Intercommunication.

QUESTIONS.

[11876.]—**Safe Load.**—A warehouse roof, 37ft. span (without other support); trusses, ordinary gutter-post construction, 8ft. 6in. apart; tie-beams, 12in. by 6in.; principals, 7in. by 6in.; straining beams, 9in. by 6in. If a floor be laid on tie-beams of such a roof, what may be considered a safe load?—W. B. C.

[11877.]—**Attic Rooms.**—Can anyone tell me of an effective and inexpensive method of treating attic ceilings and roof slopes to exclude cold and damp? The roof over has neither boarding nor felt.—A. L.

[11878.]—**Solid Floors.**—In reference to the advantage of solid floors, as evidenced by the recent fire, and also the prohibitive cost (in many buildings) of wood-block floors, perhaps some of your experienced correspondents could give us their opinions upon a system of solid floor much used in mill work in the North. It consists of an ordinary concrete and iron floor, from 5in. to 6in. thick, upon which is laid 3 by 3 wood-splined joists, and the spaces between the wood joists being filled in solid with concrete pugging (each layer of concrete being allowed time to dry thoroughly), and the surface afterwards boarded in the usual way. It makes an extremely solid floor, and is fire-resisting, and I believe many of these floors have been in use for a number of years, and would be a test on the ventilation question.—LANCS.

REPLIES.

[11862.]—**Strength of Cast Iron.**—Following up the question of your correspondent and the replies thereto, and acknowledging the advantage of direct support, I, and no doubt many others, would value some further opinion upon the subject of connection. Is it necessary to bolt the columns together, or would not a machine-planed socketed joint be sufficient when iron girders are used and bolted to column brackets, thereby maintaining position of columns? Also, by what method can the size and strength of cast-iron bracket upon shaft of column, to support a given weight delivered by iron joist, be determined? As, for instance, a 14 by 6 rolled steel joist carries a distributed weight of 26 tons, and is supported on C.I. brackets upon face of columns, bringing a weight of 13 tons on single bracket, what thickness of metal is necessary to receive this? As also the thickness of supporting web to bracket?—YORKS.

[11866.]—**Proportions.**—Your supposition that the section of many of our cathedrals are based in geometrical proportions is quite true. The plans also were arranged on the *vesica*. In Cesariano's "Vitruvius," published in 1521, the plan and section are given of Milan Cathedral, showing that the geometrical basis of the plan is this figure of the *vesica*. The section from this edition shows three great equilateral triangles bounding the outline of the cathedral seen in section; the outer triangle extends from the base line of the section (six parts from centre axis) to the apex of gable. Each of these divisions coincide with the two rows of piers forming the double aisles, each being equal to a division, while the nave equals two of them in width, and is six in height to apex of vault. The plan, as given by this authority, is based on the height of a man standing in the *vesica*, produced by two intersecting circles. The length and width are thus determined by the "Cross of our Lord." In fact the proportions of this and other churches are in conformity to certain mystical figures or cosmic measures which cannot be entered into here.—A STUDENT.

[11875.]—**Tracing Paper Preparation.**—French chalk rubbed on the surface of tracing cloth, or a little ox-gall mixed with the ink before using, makes the ink run more easily. Of the two, I prefer the chalk, although they both have their disadvantages—viz., chalk when put on to the paper dirties the coat sleeves, and it clogs the pen up when using; but then, when used, you can wash your colour over the lines. With the ox-gall, it is an objectionable-smelling preparation, and when used you cannot wash your colour over the same; but in case you make a mistake in your work, it is easier taken out than what it is with the chalk.—ALBERT C. FREEMAN.

A new reservoir for the townsfolk of Grange-mouth, which has been constructed at Millhall at a cost of £5,000, and capable of containing eight million gallons of water, was formally opened on Monday by Provost Mackay. Mr. William Black, C.E., Falkirk, is the engineer.

At the London Consistory Court, on Thursday in last week, application was made by the vicar and churchwardens of the parish of Twickenham for a faculty to authorise alterations and improvements being made in the parish church, including the extending of the chancel, and the building of two chambers, in one of which it was proposed to place the organ. Chancellor Tristram granted the faculty.

St. John's Church and churchyard will in a short time be a credit to the architectural features of Cardiff. The Rev. Canon Thompson, having found the means of completing the restoration of the tower, has now turned his attention to the churchyard cross. The restoration of this will be carried out, a portion of the shaft, base, and part of the foundations only remaining, and the whole of the upper portion of the shaft and step will be new, and worked out of the best Portland stone. The head of the cross will bear six figures, the Crucifixion being represented on one side and the Ascension on the other, the whole of which are surmounted by a canopy with pinnacles and crockets. The design is by Mr. C. B. Fowler, F.R.I.B.A., the architect under whose supervision the work of restoring the tower has just been carried out.

WATER SUPPLY AND SANITARY MATTERS.

OAKWOOD WATER SUPPLY.—These works have just been completed, and opened without any ceremony, having been in hand for two years. Their completion will make the whole of the East and West Oakwood land, forming part of the Errington Estate, available for building purposes, and as these sites are situated on the north side of the Tyne, with unsurpassed views, and are within 10 minutes' walk of Hexham Railway Station, they will speedily be taken up. The necessity for a water-supply was early recognised by the agent to the estate, Mr. Thos. Gow, of Cambo, with whom the scheme originated. Water has been obtained by boring into a fault in the millstone grit at Carr Hill, to the north of Oakwood. An abundant supply has thus been obtained and collected in a concrete collecting-tank, and brought by a line of 3in. cast-iron pipes by gravitation a distance of over one mile to an underground concrete arched reservoir at East Oakwood, holding 36,000 gallons, and thence distributed where required. The exploring for the water was done by day work, and the remainder of the work has been carried out by Mr. Gustavus Bailey, contractor, of Newcastle. The work was inspected by Mr. John Nixon, sen., of Grottingham, and the designing and the carrying out of the work has been done by Mr. Edward Brown, C.E., of Newcastle-on-Tyne.

LEGAL INTELLIGENCE.

IN RE T. W. LACEY.—On the 3rd inst., a receiving order was made by the County-court judge, at Rochester, in the case of T. W. Lacey, described as of Rochester and London. On the same day a receiving order was also made against the debtor by the London Bankruptcy Court under another petition. The first meeting of creditors under the latter proceedings was held on the 21st inst., before Mr. H. Brougham, Official Receiver. The debtor commenced business in or about 1867 with a capital of from £500 to £600. He estimates his present unsecured indebtedness at about £300, the value of the assets not being given. Mr. Amery Parkes, who attended as solicitor on the debtor's behalf, said that matters were somewhat complicated, but an application had been made to Mr. Justice Wright, who ordered that the proceedings under the two receiving orders should be consolidated and transferred to London. The debtor's accounts were not yet ready, but if an adjournment were granted, he hoped by the next meeting to be in a position to bring forward a proposal having for its object the payments of the debts in full. The assets were amply sufficient to cover all the liabilities, and there would be no necessity for an application for adjudication. The proceedings resulted in an adjournment being taken until January 11th next.

ABERAVON ANCIENT LIGHTS CASE.—In the Chancery Division of the High Court of Justice on Dec. 21, Mr. Justice North delivered his reserved judgment in the action of "Jones v. Jones," by which Mrs. Elizabeth Goodall Jones sought an injunction to restrain the defendant from so building at the rear of the Bear Inn, Aberavon, as to darken or obstruct those windows of her house in High-street, Aberavon, as overlooked Snell's-lane. Mr. Justice North, in delivering judgment, said there was no doubt that the windows in the plaintiff's old house were ancient lights. In 1839 that old house was pulled down, and in 1891 a new building was erected which was considerably higher than the old buildings, and would interfere with the lights of the houses on the opposite side of Snell's-lane more than the old buildings would have done. In erecting the new building no attention was paid to the position of the windows in the old. There was considerable controversy as to the accuracy of plans, and he must come to the conclusion that the plan upon which the plaintiff based her case was not proved to be accurate, and was not a plan upon which he could act, and that the evidence was of such a nature as made it absolutely impossible to say now what the accurate lines were. It was therefore quite impossible for him to grant an injunction in general terms which he could not possibly enforce. The plaintiff's case therefore failed, and the action must be dismissed with costs. Mr. Vernon Smith, Q.C., asked for an inquiry as to what damage the defendant had suffered by reason of an undertaking given by him not to proceed with his building until the action had been tried. Mr. Justice North directed an inquiry as to what sum the plaintiff ought to pay in respect of the damage the defendant had suffered by reason of the undertaking, the costs of the inquiry to be reserved.

IN RE FRANCIS MORTON AND CO., LIMITED.—At a meeting of creditors held at the Law Association Rooms, Liverpool, on Tuesday, December 21st, 1897. Present: Mr. Eselby, in the chair; Messrs. Hewlett, Dodds, Wright, Henderson, and Hall (committee), and 51 other creditors. The Chairman explained what had taken place since the date of the last meeting on the 5th August, 1897, and gave an account of the course of the negotiations, and of

their present position. He then gave an epitome of the statement of the company's assets and liabilities at the date of the latest stock-taking, and also communicated to the meeting the views of the representatives of the debenture holders as to the course they would feel called upon to adopt unless negotiations for the sale of the business, as a going concern, were shortly successful. Mr. W. H. Hewlett (The Wigan Coal and Iron Company) and Mr. James Dodds (The Pearson and Knowles Coal and Iron Company) spoke for the committee of creditors, and confirmed what Mr. Eshelby had told the meeting, and expressed the desire of the committee to be discharged. It was moved by Mr. J. G. Wright (Messrs. Isaac Jenks and Son), seconded by Mr. W. T. Millett (Messrs. James Watson and Co.), and resolved that the chairman be requested to arrange, if possible, with the debenture holders to continue the works and business of the company for, say, twelve months, in the hope that the works and assets may be sold as a going concern, the meeting being of opinion that such a course would be greatly to the advantage of the creditors, and would not be detrimental to the interests of the debenture holders, they being secured. A vote of thanks was unanimously accorded to the committee of creditors for their services. The Chairman said he proposed to summon the creditors again in about three months' time, unless special circumstances required an earlier meeting.

CHIPS.

The Maidstone typhoid epidemic is to be made the subject of a public inquiry by the Local Government Board. The date for the opening of the inquiry is not yet fixed. Up to the present time there have been just 1,897 cases in the town.

On Friday afternoon a special service was held at the parish church, Kidderminster, to commemorate the 50th anniversary of the restoration of the building, and to dedicate the memorial windows to the memory of the late Bishop Claughton, who for twenty-five years was vicar of Kidderminster before being consecrated ninety-seventh Bishop of Rochester. The memorial windows are the work of Messrs. Hardman and Co., of Birmingham. All the clerestory windows have been filled with stained glass, the series representing the canticle "The Benedictite." In each light is the figure of an angel holding an emblem of the "Works of the Lord." The figures, in alternate groups of ruby and blue, are clothed, with white and gold wings.

According to the returns presented to the city council of Inverness, £101,790 has been expended in building work in that city during the past year. The year 1896 gave a total of £90,000 in round figures, so that 1897, with £15,000 more, has come up to the highest expectations. Work has proceeded uninterruptedly and harmoniously as between employers and men, and the year closes with good relations between them.

A further step towards the restoration of the parish church of Keyston, near Peterborough, has just been completed by the repair of the roofs of the south transept and south aisle. The principal timbers have been restored in oak, following the lines of the old work, and new lead has been substituted for the old, which had become very defective. The work has been carried out by Mr. Pettitt, of Thrapston, under the superintendence of Mr. H. M. Townsend, architect, of Peterborough. The previous restoration of the spire and new roof were also executed under the advice of the same architect. The church was reopened last week.

A memorial, erected by Churchmen in the diocese of Connecticut, has been placed upon the wall of Marischal College, Aberdeen University, facing the place where Bishop John Skinner's old house stood, in which Seabury was consecrated, November 14, 1784. The memorial was specially designed by Messrs. Whitehead, of Aberdeen and Westminster, the style adopted being that of the building. The material used in its construction is polished grey Aberdeen granite. A cill, with jambs and head, incloses a recessed panel, the head of which is formed into a Perpendicular arch with spandrels, the feature of one being the sacred monogram, and of the other the budding staff. Within the arch, and above the inscription, is a mitre and ribbon in bronze. Beneath the inscription is another bronze representing the arms of the State of Connecticut. Both the bronzes are in high relief.

The Rev. Thomas Loxham, for the past 47 years rector of Great Lever, a township which adjoins Bolton, has intimated his intention to give £12,000 for a new church and schools in Rishton-lane, a populous part of Great Lever.

With a view to affording relief during floods in the neighbourhood of Maidenhead, the Thames Conservators have completed the enlargement of the tumbling bay at Bray weir. The crest of the old tumbling bay has been lowered 2ft. 9in., and an additional length of 50ft. of overfall has been made. These works provide 467sq. ft. of extra waterway for flood discharge at the weir.

Our Office Table.

ANOTHER old English room has been set up in the Western Arcade of the South Court of the South Kensington Museum by the side of the "Inlaid Room," from Sizergh Castle. It is from an old house, now pulled down, at Bromley-by-Bow, and belongs to the early years of King James I., the date, 1606, having been carved on the outside of the house. The spacious stone fireplace has over it an elaborate mantelpiece in oak with the Royal Arms very boldly carved. Specimens of furniture of the period have been taken from the museum and arranged in the room, in order to give it a furnished aspect. The rooms in the picture galleries formerly given up to the pictures of the Chantrey bequest, now removed to the Tate Gallery, have been hung with water-colour paintings, which were previously on screens. The arrangement of two rooms in the Cross Gallery connecting the Indian Section and Science Collections has now been completed. The first room, on descending the staircase, is devoted to Cairene art. In the second room are textile fabrics and embroideries from various parts of the Turkish Empire. On the ground floor of the Indian Section an important addition has been made to the plaster casts by a collection of details from the palace of the great Akbar, at Fathpur Sikri, near Agra.

The City Commissioners of Sewers have addressed a letter to the Improvement Committee of the London County Council, stating that they have had under consideration the question of proposed street improvements in Cripplegate, where so many buildings were recently destroyed by fire. In a report upon this matter the Improvement Committee state that they had had a conference with a deputation from the Finance and Improvement Committee of the Commissioners, who had laid before them plans showing proposals for the formation of a new east and west thoroughfare directly connecting London-wall with Smithfield, and passing through the district affected by the fire, and also a new street passing from Redcross-street to Falcon-street by way of Hamsell-street. It would be apparent, however, that these proposals did not provide for such a rearrangement of the narrow streets on the area affected by the fire as would prevent the recurrence of a great conflagration, and the proposals, therefore, in their present form did not commend themselves to the committee. The committee have replied to this effect, and are awaiting a further communication on the subject from the Commissioners.

THE Housing of the Working Classes Committee of the London County Council has presented a return showing the receipts and expenditure for the year 1896-97, in respect of all workmen's dwellings and model lodging-houses erected or owned by the Council. The balances brought forward from 1895-96 disclose a deficiency of £769, and at the end of March, 1897, the termination of the Council's financial year, the committee find themselves with a further deficiency of £1,186, making a total charge on the rates of £1,955. The committee anticipate better results in future, and state that for various reasons the accounts for the past year cannot be taken as a fair indication of the financial results of the Council's housing policy. The Boundary-street, Whitechapel, scheme, the largest work in housing the working-classes which the Council has yet undertaken, shows a satisfactory result. In all 10 blocks of dwellings are now opened on the site, some of them only as recently as March last, and the accounts so far as it has been found possible to balance them, exhibit a surplus of £33. The committee, however, expressly state that it is impossible to say from this account what may be the effect of the scheme as a whole. The accounts in respect of Beachcroft Buildings, Brook-street, Limehouse, exhibit a deficiency of £120, and when the whole of the capital charges are brought into account, the committee think that £150 will represent the probable annual deficiency in respect to these buildings. The Council's model lodging-house in Parker-street, Drury-lane, shows, as it did in the previous year, a substantial surplus in working, and in this field the Council appear to have a large, useful, and profitable opportunity of using its powers under the Housing of the Working Classes Act, 1890.

Mr. C. G. Mott, the chairman of the City and

South London Railway Company, calls attention in a letter to the Press to the rapid extension of underground electric railways in London. At present, as he says, all these railways have to be constructed under the lines of the existing streets, in order to avoid payment for the use of the subsoil; but in many instances it would conduce to the public advantage if the railways could be constructed in more direct lines under private property. This was recognised by a joint committee of both Houses of Parliament to which the question was referred several years ago, and upon their recommendation powers have since been granted authorising the railways in these cases to take an easement only, instead of being compelled to purchase the property on the surface. Considering the great depth at which these railways are constructed (generally from 70ft. to 90ft. below the surface of the ground), the value of this easement is, according to Mr. Mott, exceedingly small; but the number of separate properties under which the line in such a case would pass is so great, that the legal expenses involved in settling the amount to be paid and obtaining a separate conveyance in each case are such that, at present, the passing under private properties for any distance is not practicable. As the value of the subsoil at that depth is the same all over the Metropolis (since it can never be used in connection with the surface property), could not, he asks, Parliament fix some uniform sum to be paid for it, and so avoid the enormous legal expenses involved?

THE Middlesex County Council have deposited a Bill for next Session by which Parliament will be asked to sanction a long series of enactments for the purpose of preventing the pollution and obstruction of the waters of the river Brent and of all other streams within the county. The preamble states that these waters are so polluted as to cause a nuisance and endanger the health of residents in the vicinity, whilst the Rivers Pollution Prevention Act is too restricted to enable the council to take effective action. It is, therefore, proposed, by the clauses, to allow the council to fix a standard of purity, with powers to enforce the same "by all lawful and proper means." The powers embrace dredging of rivers and streams, shortening bends so as to improve the scour, the stopping up of outlets of sewers, and power to prohibit the passing of any matter or liquid into the waters which might lead to pollution. The Bill also proposes to empower the council to advance money to local authorities and to take over the management of main roads from the district councils.

THE 29th annual feast to 72 aged craftsmen and their wives at Exeter was held at the Luckie Horseshoe Studios, in that city, on Christmas Day. Mr. Harry Hems, as usual, occupied the chair, and Mr. Greville C. Hems the vice-chair. The meal consisted of hot joints, geese, plum pudding, washed down by a plentiful amount of Bass's beer. After dinner the family and historical old punchbowls were introduced, together with churchwarden pipes. During the afternoon the happy party was joined by the Lord Bishop of Exeter (the 61st bishop of that diocese) and his chaplain, Alderman Pople (third mayor of Exeter and the 698th mayor by succession), the mayoress, the sheriff, the town clerk, the chief constable, and several city councillors and guardians of the poor. The Loving Cup (a relic of 1861, when Mr. Hems won it as champion long-distance runner (amateur) of Yorkshire) was passed around, and many happy speeches followed, health and continued prosperity to Mr. Harry Hems and his family being proposed by the popular mayor in most felicitous terms. A capital tea was duly served, and ancient dances and songs followed. Just as "Roger de Coverley," footed by the ancient ones and the hosts together, was concluded, the bell (Peter) in the adjacent cathedral struck the hour of midnight. Then "Auld Lang Syne" was somewhat reluctantly sung, and on the guests leaving, each was presented by their hosts with a new Jubilee shilling, a pound of plum-pudding, and half a pound of tea. On Monday evening some four score orphan children were entertained to a high tea at the studios, followed by a magic lantern, dancing, &c., whilst an immense Christmas tree had its splendid crop duly divided between the delighted little folk. Whether the ancient ones or the fatherless children were the most delighted it would be hard to say. As for the hosts, we know their enjoyment was thorough.
